
There are also the counties of Falkenstein and Wartemberg, whose counts enjoy the same privileges; but as they have no towns worthy of notice, we shall not trouble our readers with a dry description of these small districts.

The lordship of Westerborg is a small territory seated between the electorate of Treves and the territory of Nassau, and contains fine pastures, and consequently sheep and horned cattle. It also produces barley, rye, oats, and pulse, with plenty of very fine earth-nuts. The woods are thinned, but it has a remarkable mine of what is called wood-coal, which is alone sufficient to furnish that neighbourhood with fuel. The colour, filaments, and twigs of this coal, nearly resemble those of wood, and the depth of the pit is about twenty feet. In this country are also deer and other game; the rivers abound with trout and cray-fish, and the ponds with pike, carp, and other kinds.

This lordship belongs to the counts of Westerborg, of which there are several branches: it only contains the little towns of Westburg and Waltersburg, and several villages.

There are also a few other lordships, as those of Kirchingen, Bratzenheim, &c. but they and some other little states are too inconsiderable to deserve a particular description in a work which has for its subject not a particular country, but the whole terraqueous globe.

The bishopric of Strasburg is also justly considered as a state of the empire, on account of a part of this bishopric lying in the Upper Circle of the Rhine; as is also the bishopric of Basil, for the same reason; and both these bishops have a seat on the spiritual bench of the council of the princes of the empire, and at the diets of this circle; but as the principal part of the bishopric of Strasburg, and the city of Strasburg itself, is in Alsace, and the chief part of the bishopric of Basil, with its capital, is in Switzerland, they will be more properly described in treating of those countries.

C H A P. XVIII.

The Circle of W E S T P H A L I A.

S E C T. I.

Of Westphalia in general; and first of the Bishopric of Paderborn. Its Situation, Extent, Produce, and Rivers: the Prerogatives of the Bishop. A Description of the City of Paderborn, and some remarkable Springs.

THE people who inhabit the country between the Weser and the Rhine were antiently called Westphalians, and from them that territory received the name of Westphalia; but the circle of Westphalia, which constitutes a part of that country, comprises in it other territories; and we ought carefully to distinguish between the circle of Westphalia, Westphalia itself, and the dutchy of that name.

This circle is surrounded by the Burgundian circle, the United Provinces, the Northern or German Sea, the Upper Rhenish, and the Electoral Rhenish circles; it being two hundred miles long, and between a hundred and fifty and two hundred broad.

Certain states were formerly reckoned in this circle, which at present no longer belong to it, as Utrecht, Guelders, and the bishopric of Cambray; in other respects also the antient and modern lists of the countries of the Westphalian circle differ greatly from each other. We shall include under it the bishoprics of Paderborn, Munster, Liege, and Osnabrug, the dutchy of Verden, the principality of Minden, the dutchy of Cleve, Juliers, and Berg, &c. the principalities of East Friesland and Mors, &c.

The summoning princes and directors of the circle are the bishop of Munster, and with him the electors of Brandenburg and the Palatinate, as dukes of Cleve and Juliers, both of whom, in this directory, enjoy together but one voice. The diets of the circle were usually appointed at Cologne; but none have been held since the year 1718. The archives belonging to it are kept at Dusseldorf.

With respect to religion, this circle is one of the mixed, and both the catholic and protestant states nominate two assessors, to assist at the imperial and chamber-court of the empire.

We shall begin this circle with the bishopric of Paderborn, which is bounded on the east by Hesse, and by the river Weser, which divides it from the principality of Calenberg; on the north by the county of Lippe; on the west by the counties of Rietberg and Lippe, and the dutchy of Westphalia; and on the south by the same, and the county of Waldec. Its greatest extent from east to west amounts to fifty-two miles, and from north to south about forty-two miles.

It is for the most part a very fertile country, and in particular produces a good breed of cattle. It has also

iron mines, salt and medicinal springs, with rivers that abound in fish; but it is most remarkable for its bacon and venison.

The Weser washes a small part of the country to the east, and the Diemel, after traversing a great part of the bishopric, discharges itself into it. The Bever and the Nette receive their source in this country, as does also the Great Hemmer, the Hee, the Niese, and other little streams, which fall into the Weser: the Lippe, which rises here, runs by Wesel into the Rhine. The other rivers are the Alme, the Pader, and the Ems.

In the whole bishopric are twenty-three towns, three boroughs, sixty-four parishes, and sixteen monasteries, all subject to the bishop.

The inhabitants are in general of the Romish religion; but there are many Lutherans among them, who frequent the churches of that persuasion in the neighbouring countries.

The bishop is a prince of the empire, and sits at the diets of the empire between the bishops of Hildesheim and Freylingen, and as a prelate is under the archbishop of Mentz. The episcopal chapter consists of twenty-four prelates and capitulars, who must be twenty-one years of age before they are admitted, and must prove their noble extraction four degrees backwards.

The revenues of this see, which is suffragan to Mentz, is thought to be about twenty-five or thirty thousand pounds.

The arms of the bishopric are, a cross or, in a field gules.

The high colleges here are the general-vicarship, the privy-council, the regency-chancery, the aulic-chamber, the officialship, and the temporal aulic-court.

This bishopric is divided by high mountains, called the Egge, into the Fore and Upper Forest district.

Paderborn is the capital of the bishopric, and is an antient city that stands in a pleasant fruitful country, in the fifty-first degree forty-five minutes north latitude, and in the eighth degree twenty-five minutes east longitude, and takes its name from the river Pader, which rises in the center of it. Five of the largest springs rise under the cathedral and the adjacent houses, discharging so copious a stream that at twenty paces distance several mills, and afterwards a still greater number in the town, are driven by it. In the cathedral formerly stood the images of the twelve apostles made of the finest silver; but in 1622 duke Christian of Brunswick took them away, and caused rixdollars to be struck from them, with this inscription, GOD'S FRIEND, THE PRIEST'S ENEMY. He also took the silver coffin of St. Liborius, which he likewise converted into money. Here is a collegiate church, two parish-churches, a Benedictine abbey, a college of Jesuits, five other cloisters, an university erected in the year

1615, and a gymnasium. This city antiently enjoyed the immunities belonging to a city of the empire: it was reckoned among the Hanse-towns, and carried on a great trade; but this trade is decreased, and the inhabitants, for the most part, subsist by agriculture and the breeding of cattle.

At Metborn, two miles from Paderborn, are three springs, two of which are not above half a yard asunder, and yet are of very different qualities: the one is limpid, of a bluish colour, luke-warm, and contains sal-armoniac, ochre, iron, vitriol, allum, sulphur, nitre, and orpiment: the other is as cold as ice, turbid and whitish, yet has much the same contents; but the water has a stronger taste, and is heavier than the other. It is said to be a perfect cure for the worms, yet the fowls that drink of it are immediately thrown into convulsions; but are soon recovered by an infusion of common salt and vinegar. The third spring, which is about twenty paces distant from the other two, is of a greenish colour, but very clear; the taste has a mixture of sweet and sour.

In this territory is the famous field of battle, where the brave prince Arminius, general of the German forces, defeated and slew Quintilius Varus, and routed the Roman army under his command; a most important victory, which freed the Germans from the Roman yoke.

SECT. II.

Of the Bishopric of MUNSTER.

Its Situation, Produce, and Rivers; the Religion of the Inhabitants; the Arms, Prerogatives, and Revenue of the Bishop; with a Description of the City of Munster, and Coesfeld.

THE bishopric of Munster is bounded on the north by the principality of East Friesland, the county of Oldenburg, and the prefecture of Wildeshausen, which belongs to the electoral house of Brunswick; to the east by the bishopric of Osnabrug, with the counties of Tecklenburg, Lingen, and Ravensberg; to the south by a small part of the dutchy of Westphalia, the county of Mark, and the dutchy of Cleve; and to the west by the United Provinces, the county of Zutphen, and the provinces of Upper Uffel, Groningen, and the county of Bentheim; and is the largest of all the Westphalian bishoprics.

This country is generally level, yet is interspersed with some agreeable eminencies, but has no high mountains. The extensive heaths serve for the breeding of cattle; it has also fruitful plains, fine woods, and good quarries of stone.

The rivers here abound with fish; the principal of them are the Ems, which traverses the whole length of the bishopric, and is increased by several smaller streams, particularly by the Aa, which rises in this country; the Lippe, which forms its boundary to the south; the Vecht, which rises here; and the Berkal. The lake of Dummer, which is near five miles in length, and half a one in breadth, lies between this bishopric and the county of Diepholz.

Munster, besides its capital, contains twelve towns that are summoned to the land diets, with twelve others that have not this privilege, and the same number of smaller towns.

At the Reformation the doctrines of Luther gained ground in this country; but the exercise of that religion was afterwards suppressed. There are still, however, several nobles, among whom some are of the Lutheran, and others of the Calvinist church; and at Weerdt both are tolerated: the popish religion, however, prevails.

The principal commerce of the inhabitants is in hogs and Westphalia hams. They generally endeavour to preserve a neutrality, when their neighbours are at war; and though there are several fortresses in the diocese, they pay twelve thousand crowns per annum for the protection of the states of Holland, who have usually a great sway in the choice of a bishop.

The provincial states of this bishopric consist of the clergy, the nobility, and the above-mentioned towns; and are usually held at Munster.

The arms of this bishopric are, a fesse or, in a field azure.

The bishop is a prince of the empire, and in the college of the princes takes place alternately with the bishop of Liege; but in such a manner that Osnabrug always sits between both. He is the first summoning prince and director of the circle of Westphalia, and at the diets of the circle, enjoys the first seat and voice. As bishop he stands under the archbishop of Cologne. The chapter consists of forty members, who are all nobles, and must prove their nobility; and once a year the shield and helmet of the youngest canon are carried in procession with public beat of drum, that every one may enquire into his pedigree. The episcopal domains are more considerable than those of Osnabrug; and the chapter maintains seven regiments. The revenues of the bishop are said to amount to seventy thousand ducats. He becomes heir to such strangers as die here without children; a very unjust custom, unknown in any other part of the empire.

This bishopric is divided into four quarters, each of which is subdivided into a number of prefectures, the principal places in which are the following.

Munster, in Latin Monasterium, the capital of the bishopric, is seated in a very fruitful and pleasant spot on the river Aa, in the fifty-second degree sixteen minutes north latitude, and the seventh degree twelve minutes east longitude, thirty-eight miles south-west of Osnabrug. It is surrounded with double ditches and ramparts, and has also a citadel called the Brille, erected by bishop Christopher Bernhard, in order to curb the town. The city is almost of a circular form, and has eight gates. The houses are mostly in the antique taste, and the principal of them are in the four market-places, particularly the senate-house, and the halls belonging to the companies. In the south-east part of the city is a large square, where the fronts of the houses rest upon pillars, and form handsome piazzas. This city has five collegiate and six parish churches, besides a college belonging to the Jesuits, a great number of convents, and other religious houses, most of them stately piles, and some of them very delightfully situated in the midst of beautiful gardens.

This city is famous for the peace concluded there in the year 1648, between the Swedes and the emperor, and the princes of the empire, by which an end was put to a war which had lasted thirty years, with vast profusion of blood; a treaty which established the fortune of many sovereigns, the liberties of the empire in general, and the free exercise of the Protestant religion in the empire; and a treaty upon which those that have been since made with Germany and the northern parts, have in a great measure been founded.

Coesfeld, a town situated in a fine plain, is, next to Munster, the principal town in the whole bishopric. It was formerly one of the Hanse-towns, and at present contains two parish churches, one college of Jesuits, four nunneries, and one monastery, and has likewise a princely judge. In the year 1591, it suffered greatly by fire, and in 1631, it was taken by the Hessians.

SECT. III.

Of the Bishopric of LIEGE.

Its Situation, Extent, Produce, and Rivers. The States of the Country; the Religion and Commerce of the Inhabitants; with the Titles, Arms, and Prerogatives of the Bishop; the Offices by which the Government is administered; and a particular Description of the City of Liege, as also of Huy, Dinant, and Spa.

THE bishopric of Liege lies in the Netherlands, and is bounded on the north by Brabant; on the east by Limburg and Juliers; on the south by Champagne and Luxemburg; and on the west by Brabant, Namur, and Hainault, extending from north to south above ninety-five miles; but dividing and running much to the southward, is of very different breadth: some small districts of this bishopric lie within the jurisdiction of Brabant and Luxemburg.

This is a delightful tract, abounding in corn-fields, pasture grounds, and cattle: the hills are covered with vineyards, which produce wines that resemble the middling

dling wines of Burgundy and Champagne, and the country has considerable forests, with many quarries of marble and free-stone; also mines of copper, lead, and iron, brimstone, vitriol, and pit-coal. This bishopric is likewise celebrated for its mineral waters, as those at Spa and Chau-Fontaine.

The principal rivers by which the country is watered, are the Maese and the Sambre.

The provincial states consist of the chapter of the nobility, and the burgo-masters of the towns; these have two general treasurers and six receivers. Each of the two first states choose four deputies annually. The burgo-masters of the city of Liege are born deputies of the third state; but have four deputies of the smaller towns to assist them. These deputies meet in the episcopal palace of Liege.

The principal exports of this country, and particularly of the city of Liege, consist of beer, arms, nails, serge, leather, and pit-coal, all which are exported from hence in prodigious quantities.

The titles of the bishop of Liege are the following, By the grace of God, bishop and prince of Liege, duke of Bouillon, marquis of Franchimont, count of Looz, Hoorn, &c.

His arms on account of Liege, are a pillar argent, on a pedestal of the same, with a crown or, in a field gules: on account of Bouillon, a fesse argent, in a field gules: on account of Franchimont, three lions in a field argent; and on account of Looz, four fesses gules in a field or.

The bishop of Liege in the council of the princes of the empire, takes rank alternately with Munster; but so that Osnabrug always sits between them. This bishopric is the third in rank in the circle of Westphalia. The ecclesiastical jurisdiction of the bishop is divided into seven archidiaconates, and the chapter consists of sixty persons.

The prince's privy council, which is filled with spiritual and secular counsellors, decides all affairs relative to the superiority and immunities of the country, and the rights and prerogatives of the prince. The aulic and rent-chamber determines all matters with respect to his revenues. The officialship has the direction of every thing relating to religion. The court of the scoffen, or high judicial court, determines all criminal causes. The ordinary council examines every thing that comes before it by appeals from the feudal and allodial court, as also all causes inconsistent with the privileges of the emperor. The feudal court judges in all feudal disputes, and the allodial court in all allodial controversies. The court of the twenty-two judge such officers as abuse their power.

This bishopric contains twenty-six towns, which are divided into the Walloon and Flemish, and has fifteen hundred parishes, seventeen abbies for monks, who must be gentlemen, and eleven for ladies: so that the annual revenues of the bishop are computed at three hundred thousand ducats, and he is said to be able to maintain eight thousand troops, without oppressing his subjects, the bulk of whom are of the Popish religion.

The principal places in this bishopric are the following:

Liege, by the Germans called Luyck, is seated on the river Maese, in the fiftieth degree forty-six minutes north latitude, and the fifth degree twenty-eight minutes east longitude, in a vale between two mountains, one of which stands to the north, and the other to the east. The city itself is generally divided into the Old or Upper, and into the New or Lower Town, and the last is subdivided into two parts, namely, into the island and the quarter beyond the Maese. The Upper Town stands on the declivity of the northern mountain, which is called the Holy Walburg, and extends on the south to an arm of the Maese, by which it is separated from that part of the Lower Town called the Island; but to the north terminates on the Great Maese, which divides it from the quarter beyond that river. The Lower Town, also called the Island, is encompassed by two branches of the Maese, which unite at the point of the island; and the quarter beyond the Maese is a peninsula situated between the river and the eastern mount

named Cornillon. These several parts of the town have a communication with each other by bridges.

This city is well fortified, and defended by a citadel, erected on the mountain of the Holy Walburg. At the foot of this mountain stands the grand episcopal palace, part of which was burnt down in the year 1734; but was rebuilt in 1737, at the expence of the provincial states, in a regular and fine taste. In it are not only held the meeting of the states; but the high colleges. The council-house, which was ruined by a bombardment in 1691, was magnificently rebuilt in 1714, and contains a public library. This city has sixteen gates, seventeen bridges, some of which are very handsome, twelve public squares, one hundred and fifty-four streets, most of which are broad and straight, a cathedral, and seven collegiate churches, thirty-two parishes, five abbies for men, and the same number for women, thirty-two cloisters of both sexes, two colleges of Jesuits, one seminary, ten hospitals, and a chartreuse. The endowments of the ecclesiastics are so rich, and the situation so pleasant, that Liege is commonly stiled the paradise of the clergy. The houses are high, and generally built of bluish marble. Here are also two fine quays adorned with rows of trees, and the city is four miles in circuit.

The cathedral of St. Lambert is extremely large; but is a heavy structure: it contains a great number of pretended relics, besides busts and statues of silver, and a St. George on horseback, which is said to be of gold. Among the many collegiate and parish churches, that of St. Paul is remarkable for its structure and fine ornaments. All the regular orders have very beautiful convents, and among the rest is the college of English Jesuits, and a fine nunnery for English ladies. In St. William's convent lies Sir John Mandeville, the famous romantic English traveller, and near his grave are kept the saddle, spurs, and knife he used, and on his tomb is an inscription in old French, requesting passengers to pray for him.

The city of Liege is not only called the paradise of the clergy, but the hell of women, they being obliged to drag the boats, carry burthens, and work harder than in any other place; as a consequence of this it is termed the purgatory of men, as their wives generally domineer over them.

In this city are a multitude of brewers, who export great quantities of beer. The manufacturers of arms and nails in this city have a great demand for them. Its leather and serge is also famous; and from this town, and its territory, the Dutch receive most of their pit-coal. The magistracy have been severely handled by their bishop for pretending that Liege is a free imperial city, and disputing his authority. In the year 1691, it was bombarded by the French, and in 1702, taken by the duke of Marlborough.

About two miles from the city is the episcopal palace of Sering, in which the bishop usually resides during a considerable part of the summer; and near it, on the Maese, is a well built village, that contains many pleasure-houses.

Hui, or Huy, is seated on the Maese, which at this place receives into it the little river Huy. It lies in a pleasant vale, and is divided by the Maese into two parts, that have a communication with each other, by means of a stone bridge. The small river Huy also dividing into several branches, forms a number of little islands in the town, that are inhabited and joined together by bridges. To the north of the town lie five or six suburbs. Huy was once well fortified; but it has been frequently besieged and taken, particularly in the year 1715, when its fortifications were destroyed; but tho' it has undergone various misfortunes, it has still many fine houses, with one collegiate, and fourteen parish churches; an abbey, a cloister of regular canons of the order of the Holy Cross, sixteen convents of both sexes, and a number of chapels and hospitals. On the river Huy are several paper-mills and iron-works, and the adjacent country yields corn, wine, allum, sulphur, and pit-coal.

Dinant, in Latin Dionantum, a city seated on the Maese, amidst hills and rocks, and consisting of the Town properly so called, of the Lower Town, the Island

quarter, and some suburbs. It contains one collegiate, and seven other churches, a college of Jesuits, with six cloisters and hospitals. Before the town are some fine quarries of marble, and other stone. The principal trade carried on here consists in leather. In 1554 it was severely handled by the French. In 1674 it was taken by the Austrians, and the following year by the French, who did not restore it till the peace of Nimeguen.

Spa, or Spaw, a town celebrated for its mineral waters, is seated in a valley surrounded with mountains, and contains three hundred houses. The part called the Old Spa, which is properly only a suburb to the other, consists of miserable cottages, and when strangers arrive, the poor inhabitants send out a swarm of children to get what they can by begging. The houses of New Spa are little, dark, old fashioned wooden buildings, and yet it is affirmed, that they can make twelve hundred beds for strangers. The church of the Capuchins, and the parish church are both seated upon eminences, and make a good appearance at a distance. The inn called the court of London is very large, and as it is the best in the place, is most frequented by strangers. The name of the five principal wells are Tunnelet, Watpotz, Saviniere, Geronflerd, and Poubon. The inhabitants are employed in making toys, and other things for strangers, to whom they are very civil, and ready to do them all good offices. Near the city there are excellent fish, and good game, to accommodate those who go to the Spa.

S E C T. IV.

The Bishopric of OSNABRUG.

Its Situation, Extent, Produce, and Rivers. Of the Inhabitants, their Employments, Religion, and Trade. The Regulations established with regard to there being alternately a Protestant and Popish Bishop. Its Revenue, Arms, public Offices, and Chapter: with a particular Description of the City of Osnabrug.

THE bishopric of Osnabrug is seated in the center of the circle of Westphalia, and is bounded on the north by the bishopric of Munster; on the south by Munster and the county of Ravensburg; on the east by the same county and the principality of Minden; and on the west by Munster, and the counties of Lingen and Tecklenburg; but the prefecture of Rechenberg lies separate. This bishopric extends forty-seven miles from north to south, and between nineteen and twenty-eight from east to west.

Almost one-half of this bishopric consists of heathlands that yield pasturage, and above ten sorts of turf. The country, however, produces as much rye as supplies the necessities of the inhabitants and five hundred stills. Considerable quantities of wheat, oats, and most of the barley used here, are imported from the principality of Minden and the county of Schauenburg; and, as there are but few cattle bred in this bishopric, great numbers are brought from East Friesland. The country has but little wood, but, besides their turf, they have some coal-pits. Marble is also found here.

The principal rivers are the Hase and the Hunte, both which rise in this country.

The inhabitants are diligent and laborious, and the country people here seldom sit, as in other parts of Germany, by stoves; but usually by the fire-side, where they perform their principal work, which is spinning; and about six thousand peasants go every year to Holland, in order to mow, cut turf, and do other work for hire; and it is said that the meanest of them bring home twenty, and the best workmen seventy florins; so that the ready money thus brought into the country may be reckoned at two hundred thousand florins a year.

There are in this bishopric many vassals who belong partly to the chapter and popish clergy, and partly to the burghers. The number of Catholics and Protestants is thought to be nearly equal, though the former have thirty-two churches, and the latter only twenty; but no Jews are tolerated in the country.

The most beneficial employment of the inhabitants consists in spinning yarn, and manufacturing a coarse kind of linen, which is conveyed by the English, Dutch, and Spaniards to their settlements in Africa and America: there are also some coarse woollen cloths made in this country.

At the peace of Osnabrug, in 1648, it was settled that this bishopric should alternately have a catholic and a Lutheran bishop, and in consideration that the house of Brunswic had for the sake of a general peace made several valuable sacrifices, namely, of the coadjutorships of Halberstadt and Magdeburg to the elector of Brandenburg, of that of Bremen to the king of Sweden, and of the bishopric of Ratzeburg to the dukes of Mecklenburg, the Lutherans, who were to have the alternative, were to be a younger prince of the house of Brunswic-Lunenburg, the present royal family of Great Britain; and on failure of that, the alternative was to pass to Brunswic-Wolfenbuttle, now Brunswic-Bevern: so that the protestant alternative has been enjoyed by prince Ernest, grandfather to his late majesty, and afterwards the next turn by another prince Ernest, the late king's uncle, who was created duke of York; and upon the decease of the archbishop of Cologne, who was the last incumbent, Frederic, the second son of the king of Great Britain, was elected bishop in 1764.

But though this bishopric is alternately hereditary in the house of Hanover, it is not so with regard to its popish bishops, who are chosen out of different families by the chapter, which consists of twenty-five canons, the revenues of eighteen of whose prebends are enjoyed by the Romish ecclesiastics; those of four, by the Jesuits, for the support of their college; and the other three by Lutheran canons only, who are capable of electing, but not of being elected bishops, as the catholic canons are. When there is a popish bishop, he is suffragan to the archbishop of Cologne as metropolitan; but when there is a protestant bishop, the exercise of the metropolitan jurisdiction is to be suspended. Since the reformation introduced here in 1534, the bishop of either denomination has, with the dignity and power of a temporal prince, little more than the name of a bishop.

The revenue of this bishopric amounts to between twenty and thirty thousand pounds.

The arms of this bishopric are an orb gules, set with six spokes in a field argent.

The bishop is a prince of the empire, and may sit in the diet of the empire in the council of the princes between the bishops of Munster and Liege.

The public offices are the prince's privy-council, which has the care of the episcopal board-lands, and the supreme inspection of the country. The prince's chancery of lands and justice, consisting of two catholic and two Lutheran counsellors, one of whom is at the same time a director; as also of a catholic and Lutheran secretary. From this court an appeal lies immediately to the supreme court of the empire. The episcopal officialship enjoys, in civil causes, a jurisdiction jointly with the chancery; but, with respect to such ecclesiastical matters as belong to the catholics, jointly with the archdeacons, from whom, notwithstanding, an appeal may lie to the official. The prince's Lutheran land-consistory is composed of a secular president, two spiritual counsellors, and a secretary.

The bishopric is divided into prefectures, each of which has a noble seneschal, together with a rent-master, who collects the revenues belonging to the bishop; a rural count, or judge, a court clerk, and a fiscal. These prefectures consist of parishes, and the parishes of peasantships, which are properly small villages that have no churches, and frequently only certain little districts in which many peasants reside together.

All the officers must swear to be true to the sovereign and the chapter. On the decease of a bishop the chapter takes possession of all, and fills up, in conjunction with the magistrates of the city of Osnabrug, the vacant offices; for almost all the officers, the rural counts excepted, lose their posts on the decease of a bishop, till they are again reinstated in them by the chapter, which retains or discards them at pleasure; but the new bishop again makes a change in the officers.

The

The principal city in this bishopric is Osnabrug, or Osnabruck, in Latin Osnabruga, which is seated in a vale by the river Hase, in the fifty-second degree forty-two minutes north latitude, and the seventeenth degree thirty-eight minutes east longitude. It is a neat well built city; but the buildings are antique. It has several handsome public structures, and is encompassed with walls and ditches, but commanded by a mountain within cannon-shot, upon which is an abbey or rather a place for men of quality to retire to for devotion. The number of houses, exclusive of the public buildings, amounts to twelve hundred; but the place is not populous. The episcopal palace was built by bishop Ernest Augustus, and belongs to the electoral house of Brunswic-Lunen-burg, who usually resigns it to the catholic bishop for his use. This palace is well fortified, and separated from the town by a bridge. This structure is erected in the form of a hexagon, and at each corner is a turret, with a court in the middle. It was in one of the apartments of this palace that king George I. expired, on the eleventh of June, 1727, in the arms of his brother prince Ernest; and, it is said, in the very room where he was born.

The chancery is but an indifferent building. In the hall of the council-house, where the celebrated peace of 1648 was concluded, are the pictures of the several ambassadors who assisted at it. There are also shewn here, in a thin folio, the portraits of the bishops of Osnabrug, which George Bergen drew with his pen. In St. Peter's cathedral are shewn the silver coffins in which lies St. Crispin and Crispinian; and here are also interred several bishops. The cathedral church of St. John is the second parish-church belonging to the Romans. The Lutherans have two parish-churches, which are those of St. Mary and St. Catharine.

The Romans have not yet the privilege of making processions in the city. In their church-yards the Lutherans are buried, but the catholics are not interred in those belonging to the Lutherans.

There is here a college of Jesuits, with a monastery of Dominicans, and a nunnery of Augustines; also a commendry belonging to the Teutonic order of St. George, with a small church, and a seat of the order of St. John. Till the year 1595 the Lutherans and Papists had a school here in common, at the *Collegium Carolinum*, in which were teachers of both churches; but in that year a separation was made, when the Lutheran gymnasium arose, in the possession of which the town was confirmed in 1603, by the aulic-chamber of the emperor and empire. In the *Collegium Carolinum* the Jesuits have their seminary.

The church belonging to the cloister of Augustines, which was deserted at the time of the reformation, has been converted into a prison and house of correction. There are here also three well built hospitals, and some smaller ones, with a Romish and Lutheran orphan-house.

The principal subsistence of the inhabitants depends upon the linen trade, and the foreign manufactures retailed here. The magistracy are Lutheran, and re-chosen annually on the second of January. This was the first town in Westphalia that received the Lutheran doctrine, Dr. Herman Hecker, a monk of the order of St. Augustine, and former master to Luther, preaching it here from the pulpit in the year 1519. This city denies the power of the bishop in affairs relating to the church and police; and is also possessed of the criminal jurisdiction, with the right of fortification, and has a consistory of its own, as also the excise, and the privilege of collecting the rates of the burghers, with an annual revenue of about eight or nine thousand rixdollars. It is possessed likewise of the right of coining copper money, which it exercised for the last time in the year 1740.

S E C T. V.

Of the Principality of MINDEN.

Its Situation, Extent, and Produce: the Religion and Trade of the Inhabitants: the several Offices by which the Government is administered: the Revenues received by the King of

Prussia from this Country; and a particular Description of the Cities of Minden and Lubbecke.

THE principality of Minden lies to the west of the bishopric of Osnabrug, and is nearly a hundred and fourteen miles in circuit. It consists for the most part of good corn-land, and agriculture being carried on with great diligence, the inhabitants supply the neighbouring countries with corn, and particularly with wheat and barley; flax also is cultivated with such success, that they are likewise able to supply their neighbours with it. The meadows and pastures breed a considerable number of cattle. They have also wood, pit-coal, turf, and an important salt-work, which supplies both the Prussian and the adjacent countries with that commodity. The Weser traverses the country, and is of great advantage to its commerce.

With respect to the religion of the inhabitants, those of the Romish church enjoy only in the city of Minden, and the Calvinists every quarter of a year at the citadel of Petershagen, their public worship; and all the other churches in the country belong to the Lutherans; yet the Jews are allowed their schools at Minden and Lubbecke.

The inhabitants are chiefly employed in agriculture, the breeding of cattle, the spinning of linen, and weaving of buckram. They also make a kind of half linen and half woollen stuffs: considerable quantities of yarn are exported from this principality, and the coarse linen made here is sent to England and Spain. There are here considerable breweries, a great trade in corn, sope, horses, and all sorts of cattle.

Charlemagne erected this country into a bishopric; but the precise year of its foundation is not known, though it is supposed to be about the year 803, from which time, to the peace of Westphalia, are reckoned sixty bishops: but at the peace of Osnabrug, in 1648, the bishopric of Minden was resigned as a principality to the electoral house of Brandenburg, instead of the ceded countries of Pomerania. On the fifteenth of October, 1649, the elector Frederic William caused the citadels of this principality to be possessed by his officers; and on the twelfth of February, 1650, received the homage of the inhabitants.

Over this principality and the county of Ravensberg a regency is appointed, which also, in conjunction with the two superintendents of these countries, and the Protestant court-chaplain of Minden, constitutes the consistory. Both colleges conduct in common such affairs as relate to the sovereign; but the regency alone enjoys the administration of justice, that over the knights in the first instance, and over the others in the second. The war and domain-chamber manage all affairs relating to war, trade, and manufactures. Out of these colleges, or offices, another of health is appointed, which, when any infectious disease prevails among the inhabitants, or cattle, makes the necessary provision for putting a stop to it. Here is also a provincial medicinal-college, in which a member of the war and domain-chamber presides, and takes care that the country be provided with skilful physicians, apothecaries, surgeons, and midwives. At Minden and Lubbecke the civil power is administered by the magistrate, but in the country by officers appointed for that purpose; and it is also in some measure exercised by the chapter, the provost of the chapter, and several religious foundations.

The annual revenue arising to the sovereign from the domain-lands are, according to Dr. Busching, rated at somewhat more than a ton and a half of gold in rixdollars; and the revenues of the war-chest, arising from this principality and the counties of Ravensberg, Tecklenburg, and Lingen, are estimated at about two tons and a half of gold.

The principal places in this country are the following:

Minden, the capital of the principality, is seated on the west side of the Weser, in the fifty-second degree thirty-one minutes north latitude, and in the eighth degree thirty-eight minutes east longitude. It is a neat and well fortified town, environed with ramparts and ditches,

ditches, and has a stone-bridge over the Weser. Its commodious situation for trade and navigation, its brewery of a pleasant white beer, and in some measure also its agriculture and breed of cattle, supply its inhabitants with the means of procuring a comfortable subsistence. The cathedral is a noble and large, though dark structure, and near it is a handsome chapter-house. The chapter consists of eighteen persons, who are partly Roman catholic and partly Lutheran, and has a chapter-cross which hangs at an azure ribbon, and was conferred by the king in 1756. The church of St. John also belongs to the Papists, and contains a collegiate foundation of ten catholics. St. Martin's, the principal church belonging to the Lutherans, has also a collegiate foundation of nine persons, who are partly Roman catholic and partly Lutheran, together with six vicars. Near St. Martin's church is a female foundation for twelve persons, the abbess of which has a pretty extensive feudal feat. The third Lutheran church is that of St. Simeon. The churches of St. Paul and St. Nicholas also belong to the Lutherans; but it is seldom, and only at certain times, that divine service is performed in them. It has likewise an orphan-house, and three alms-houses.

This city has suffered greatly by war, and has several times been besieged and taken. Upon the plain in the neighbourhood of this city a memorable battle was fought on the first of August, 1759, in which the confederate army under prince Ferdinand of Brunswic totally routed the French, when the troops of the allied army, particularly the British foot, signalized their valour in so extraordinary a manner, against much superior numbers of the enemy, as gained them immortal honour.

Lubbecke, a small town, which ever since the year 1279 was encompassed with walls, ramparts, and ditches. It enjoys considerable immunities, and in particular the jurisdiction over a considerable district. In it are thirteen gentlemen's seats, and one of the order of knighthood is always first burgomaster; hence the magistracy bear the title of knights, burgomaster, and council. The inhabitants, most of whom are of the Lutheran religion, trade in yarn and linen; they also carry on agriculture, and the breeding of cattle, brew beer, and distil spirits. Near the parish-church is a collegiate foundation, consisting of one dean and four canons, among whom there must be always a Roman catholic.

SECT. VI.

Of the Dutchy of VERDEN.

Its Situation, Extent, Produce, and Rivers: the Religion of the Inhabitants: the Offices by which the Government is administered; with a Description of the City of Verden.

THE dutchy of Verden terminates on the dutchy of Bremen and Lunenburg, and is computed to be about twenty-eight miles in length and breadth. It consists, for the most part, of heath and high land, as also of forests; but on the rivers Weser and Aller is good marsh land.

The Aller waters almost all the south part of this dutchy; but the Weser only some of the westerly boundaries, where it receives the former into it. The other rivers of this dutchy are the Wumme, which rises on the borders of Lunenburg, and traversing the dutchy from east to west, receives the smaller rivers that rise here, as the Fintau, the Veerse, the Werdau, and the Rodau; after which it enters the dutchy of Bremen.

The inhabitants are of the Lutheran religion, and the country has the same consistory with Bremen, and also one and the same general superintendent; but at Verden is also a special superintendent, who is a member of the royal consistory, and has under his inspection the twelve provincial parishes of this dutchy.

Verden was a bishopric founded by Charlemagne; but at the peace of Westphalia, in 1648, the crown of Sweden obtained the bishopric as a dutchy. It was afterwards taken by the Danes; but by virtue of the alliance concluded at Wismar in 1715, it was ceded, together with Bremen, by the king of Denmark, to the electoral house

of Brunswic-Lunenburg; and in the year 1718 the king of Sweden made the same cession.

In the council of the princes of the empire the king of Great Britain, as duke of Verden, has a seat on the temporal bench, after the prince of Halberstadt, and also at the diets of the circle of Westphalia.

This dutchy has the same regency with that of Bremen, namely, a chancery, and an aulic-court; in the latter of which an assessor sits, both for the nobility of this dutchy, and for the town of Verden. The land states of this dutchy consist of the nobility and town of Verden. Both the council of nobles here, and that of the town of Verden, appear, in conjunction with the land-states of Bremen, at their diet at Basdel, when any affairs are to be discussed there that have a relation to both dutchies.

The city of Verden is seated on the Aller, which here divides itself into two branches, and is at present only frequented by the ships that go up and down the Aller. There are here four churches; the cathedral, near which is the church of St. Andrew, that of St. Nicholas, and that of St. John. In this town is also a Latin-school.

SECT. VII.

Of the Dutchy of CLEVE.

Its Situation, Extent, Produce, and Rivers: the Religion of the Inhabitants: the Offices by which the Government is administered: the Revenues the King of Prussia receives from this Dutchy; with a Description of the Cities of Cleve, Emmeric, and Wesel.

THE dutchy of Cleve, or Cleves, terminates to the east on the bishopric of Munster; to the south on the dutchy of Berg, the principality of Mors, the archbishopric of Cologne, and Prussian Gueldres; to the west on Brabant and Gueldres; and to the north on Gueldres and Munster; extending forty miles in length from north to south, and fifteen in breadth from east to west.

This country abounds in corn, fruit, and all manner of plants: it has very fat meadows, in which are bred a considerable number of horned cattle and horses. In general it is well cultivated, and has many delightful spots, particularly near the city of Cleve: all kinds of game are here in plenty, particularly on the west side of the Rhine. This river divides the country into the eastern and western parts, receiving into it the rivers of Roer, the Emser, and the Lippe. The Maese touches also on a part of the dutchy, and receives into it the Niers, which rises in the dutchy of Juliers. The Old Issel also traverses a part of this dutchy. All these rivers abound pretty much in fish; and the salmon, pike, and carp of the Rhine, are particularly admired.

The inhabitants are mostly of the Romish church; but the Calvinists, Lutherans, Mennonites, and Jews, are allowed the free exercise of their religion. There are six collegiate churches, two commanderies of the Teutonic order, one *commendam* belonging to the order of St. John, the abbey of Elten and Hamborn, seventeen monasteries, and about thirty nunneries.

The voice of Juliers, Cleve, and Berg in the council of the princes of the empire has been dormant ever since the death of duke John William. In the circle of Westphalia the elector of Brandenburg, and the elector Palatine, as dukes of Cleve, Juliers, and Berg, bear alternately the office of sending the circular letters to summon the states to vote; but in the *directorium* have but one voice between them.

In the city of Cleve is the royal regency appointed over this dutchy and the county of Mark, to which the antient aulic-judicatory has been united, and in it too is a consistory held monthly; so that this high college regulates all the affairs of church and state, and appeals lie to it from all the other courts. The war and domain-chamber of Cleve, Mors, and the Mark, take cognizance of every thing relating to œconomy, the forest, tolls, contributions, excise, mines, war, &c. and under it is the provincial council established in 1563, that regulates every thing relating to the police; but civil and criminal affairs are administered by the provincial judicatories appointed

pointed in the year 1753 at Cleve, Xanten, Wesel, and Dinflacken; and to these the subjects of the adjoining prefectures are referred.

The annual revenue arising to the king of Prussia from the domains of Cleves and the Mark, are estimated at about three hundred fifty-six thousand rixdollars, and the sum brought to the war chest from Cleve, the Mark, and Mors, to about three hundred forty thousand.

The principal places in this dutchy are the following:

Cleve, in Latin Clivia, is said to derive its name from its situation among cliffs and the declivity of a hill, where it stands between the Rhine and the Maese, in one of the finest countries in Germany. It is seated in the fifty-first degree fifteen minutes north latitude, and in the sixth degree twenty-four minutes east longitude. It is small but pleasant, well built, and well peopled, having several fine houses belonging to persons of quality; but those of the ordinary burghers are mean. The castle is large, and delightfully seated on the top of a hill; but is irregular and not very strong. It has stately apartments, and there the king of Prussia resides when he comes to this city. The inhabitants chiefly subsist by the circulation of money occasioned by the residence of his deputies, who govern the dutchy, and by the meeting of the states, who assemble in the castle. There are here a German Calvinist and a French Calvinist church, one belonging to the Lutherans, and another to the Mennonites, together with an academy belonging to the Calvinists, with a popish collegiate church, two monasteries, and a nunnery. The river Hel, which runs by the foot of the castle, is navigable by small vessels to the Rhine; and on the west side of the city are what is called prince Maurice of Nassau's park, in which are many ponds, canals, fine water-works, grottos, and the like. Above them is the high hill of Sternberg, from whence may be seen Utrecht, though it is fifty miles distant, with near forty other cities and great towns, twelve of which are seen through so many walks cut through the woods. The prince's house stands in a wood on the east side, and, among other curiosities, has a noble collection of old Roman urns, and several other monuments of antiquity.

Emmeric, or Embric, in Latin Emerica, or Embrium, is a large, rich, and beautiful town, pleasantly situated on the east side of the Rhine, four miles to the east of Cleve. It is a very antient city, and has a pretty good trade, and was formerly one of the Hanse-towns. Here is always a small garrison; but though the fortifications were formerly very considerable, they have of late been neglected. The governor, with the magistrates, and many of the burghers, are Protestants, and have a church here. The Roman catholics have two churches, one of which is collegiate, with two monasteries, a nunnery, and a college of Jesuits.

Wesel, in Latin Wesalia, is the largest and best built town in the dutchy, it being populous and well seated for trade. It was formerly one of the Hanse-towns, and an imperial city; but was exempted by the dukes of Cleve from the contributions paid by those towns to the military-chest of the empire. It grew rich by the concourse of merchants, who fled hither from the persecution in the Spanish Netherlands, and was garrisoned by the Dutch, to whom it was mortgaged by the elector of Brandenburg. It was taken and plundered by the French in 1672; but was restored two years after to the elector, after it had been dismantled. Though this place submits to the king of Prussia as its sovereign, it is governed by its own laws. Both the town and its two suburbs are well fortified, after the modern way, with bastions, half-moons, and ditches; and in the middle curtains there are galleries which run into the ditch, and have separate places for the men and women in case of a siege; and it is esteemed one of the strongest towns in all Europe. It has a good citadel towards the Rhine, a small harbour for vessels that trade on that river, and an arsenal well filled. The Calvinists, Lutherans, and Roman catholics have all churches here. There are here a Lutheran academy, three monasteries, a foundation for ladies, called Averdortf, who are for the most part Lutherans, and a commendam of the order of St. John. The city has a seat and voice at the provincial diet.

S E C T. VIII.

The County of the MARK.

Its Situation and Produce: the Religion and Trade of the Inhabitants: the Offices by which the Government is administered; with a Description of Ham, Unna, Iserlon, and Saest.

THE county of the Mark is bounded on the north by the bishopric of Munster, on the east by the dutchy of Westphalia, on the south by the dutchy of Berg, and on the west by the dutchy of Cleve; and is esteemed the largest county in all the circle of Westphalia.

It enjoys a fertile soil that produces wheat, rye, barley, oats, buck-wheat, peas, vetches, lentils, beans, rape and turnip seed, as also such plenty of flax and hemp as to supply the neighbouring countries with them. It also produces plenty of fruit, together with good kitchen-roots and herbs. It has fine meadows and pastures, with a good breed of cattle, and all manner of game. In the mountains are mines of silver, copper, lead, iron, and coal, with quarries of stone.

The inhabitants of this country are Lutherans, Calvinists, and of the Romish church; all being allowed the free and public exercise of their religion, and no restraints laid upon the consciences of the people. There are many manufactures here, the produce of which not only supplies the country, but great quantities are exported, particularly of iron and steel worked in a variety of ways.

This country is subject to the electoral house of Brandenburg, who in 1753 appointed six judicatories over the whole county, each of which has its own justice, assessors, and clerks: at the same time, for the regulation of affairs relating to the police, four circles are appointed, in each of which was placed a provincial-council.

The principal places in this county are the following:

Ham, in Latin Hammona, is the capital of the whole county, and is seated near the borders of the bishopric of Munster, by the influx of the Aale into the Lippe. It has no walls, but is encompassed with ditches, ramparts, and palisades. This city is pretty large and well built. It has a citadel in which a commandant resides, and contains also a *gymnasium illustre* belonging to the Calvinists, in which are three professors, and a Latin school, with a large church that also belongs to the Calvinists, a Lutheran church, and a cloister of Observants, with noble appointments for the poor. Just before the north gate is the Norder hospital, a noble foundation for protestant and popish ladies; but the small church near it is only used by the Catholics.

This town has a considerable trade, and was formerly one of the Hanse-towns. It has frequently suffered very much by fire, particularly in 1741, when three hundred and fifty houses were burnt down, with the council-house and the church belonging to the Calvinists; but better buildings have been erected in their stead.

Unna, the second town of the county, is seated in a fine plain, on a rivulet called the Kottelbecke, and is surrounded with walls and ditches. It has a Lutheran parish-church, and hospital church, in which the Calvinists perform divine worship, as a Lutheran preacher does on Saturdays. Here is likewise a nunnery, together with a Romish chapel and a Lutheran school. The town is possessed of a very extensive and profitable territory; and most of the burghers subsist by agriculture, distilling, and brewing. This was also antiently one of the Hanse-towns.

At no great distance is the mountain of Haslo, on which is the free secular foundation of Frondenberg, belonging to the Cistercian order, which has an abbess and twenty-four ladies belonging to it, and into which both the Protestants and Roman catholics are received: besides several tythes and corn-rents, above a hundred farms belonging to the peasants are subject to it.

Iserlon, also called Lon, is a considerable town well inhabited, and seated in a mountainous tract. The Lutherans have here three churches, with a Latin school;

the Calvinists have one church, and the Roman catholics, in 1746, erected one for themselves. The principal employment of the inhabitants consists in manufactures and trade; for here are made all works in iron and brass, woollen stuffs, velvets, and ribbons. This town has been frequently laid waste by fire.

Soest, in Latin Sufatum, is a city of considerable circuit, in which are extensive courts and gardens, but is meanly built. It is situated twelve miles to the east of Ham, and is fortified with double walls, on which are thirty towers, and is also defended by a large deep ditch. The Catholics are in possession of the cathedral and two monasteries; but the Lutherans have seven churches, in one of which the Calvinists perform public worship. The Lutheran Latin school is one of the three archigymnasia (as they are called) of Westphalia. To this town belongs a considerable extent of arable land, and its principal trade consists in corn.

This was formerly one of the Hanse towns, and the inhabitants chose their own magistrates; but, in 1752, the king abolished the old magistracy, and appointed a standing one. They had here an antient body of laws, which was the foundation of those of Lubec.

We shall conclude this account of the Mark with a concise account of the imperial city of Dortmund, in Latin Tremonia, which is situated twenty-six miles to the west of Soest, and was antiently one of the Hanse towns. It is pretty large, but slightly built, and contains four Lutheran churches, one nunnery, and two monasteries. It has likewise one of the three archigymnasia of Westphalia, and enjoys a seat and voice on the Rhenish bench of the college of the imperial cities. The territory belonging to this city is an antient county, that contains many villages.

SECT. IX.

Of the Dutchies of JULIERS and BERG.

Their Situation, Extent, Produce, and Rivers: the Offices by which these Dutchies are governed: the Revenues the Elector Palatine receives from them; with a Description of the Cities of Juliers, Duren, Dusseldorf, Bensberg, and Essen.

THE dutchy of Juliers is bounded on the north by the dutchy of Gueldres, on the east by the archbishopric of Cologne, on the south by Luxemburg and Treves, and on the west by Liege and Limburg, extending about ninety miles in length, and in breadth in some parts above forty-three, but in others much less.

This dutchy has a fruitful soil, that produces all sorts of corn in abundance, and has also good meadow and pasture lands. The breed of cattle is considerable, particularly of horses, which are sent to the neighbouring countries, and also into France. Much wood is cultivated here, and in some parts pit-coal is found.

With respect to the rivers, the Maese terminates this country on the west side, and the Rhine on the east. The Roer rises here, and having traversed a great part of the country, receives into it the little rivers Worm and Dente, also called Inda or Inga. The Erft also rises here, and traverses the country to the east. The other rivers are the Niers and the Ahr.

The provincial states of Juliers united in the last century for the maintenance of their privileges: these united states consist of the nobility of both countries, and the four principal towns of each dutchy. The inhabitants assert, that they do not depend on the unlimited arbitrary will of their sovereign; but were always governed according to their antient customs, rights, and immunities.

The inhabitants are partly of the popish and partly of the protestant church, and both enjoy the free exercise of their religion, and perfect liberty of conscience.

These dutchies are subject to the elector Palatine, whose arms on account of the dutchy of Juliers, bear a lion sable, in a field or; and for the dutchy of Berg, a lion gules, crowned azure, in a field argent.

The provincial colleges of Juliers and Berg, with the privy-council, the aulic-council, the chancery, and the

aulic-chamber, are held at Dusseldorf, in the dutchy of Berg. An annual sum is granted to the sovereign by the states of Juliers and Berg, which in the year 1755 amounted to five hundred and eighty thousand rixdollars, to which was added a free gift of fifty thousand florins.

The dutchy of Juliers is divided into twenty-nine prefectures and signiories, the principal places in which are the following:

Juliers, or Julich, also called Gulich, and in Latin Juliacum, is the capital of the country, and is situated on the Roer, in the fiftieth degree forty-eight minutes north latitude, and the sixth degree forty-six minutes east longitude. The river here is very subject to overflow its banks: the city is well fortified, and has a citadel, which is said to be as strong as the best engineers in Germany could make it; it being thirty years in building. Within it is a spacious piazza, with the palace of the antient dukes. The streets are broad and regular, and the houses neatly built of brick. It has a Roman catholic collegiate church, with one belonging to the Calvinists, and the Lutherans have another before the town. In the suburbs is a Carthusian monastery, nobly endowed by the dukes. This city is very antient, and obtained its name in the time of the Romans.

Duren is reckoned the second among the towns that have a voice and seat among the diets. It is small, uniform, and well built, with streams of water running through the streets. It was made an imperial city by Charles IV. but subdued by the duke of Juliers in 1407. Charles V. took it by storm, put the garrison to the sword, and burnt it in 1543; but it was afterwards rebuilt and restored to the duke. The handsomest structure in this town is St. Martin's church, where they pretend to have the head of St. Anne, the mother of the Virgin Mary, which formerly brought abundance of pilgrims to this place.

The dutchy of Berg, so named from its mountains, is seated on the east side of the Rhine, opposite to the electorate of Cologne, and is bounded on the north by the dutchy of Cleve and the principality of Mors, from which it is separated by the Rhine; on the east by the dutchy of Westphalia and the county of the Mark; on the south and west by the archbishopric of Cologne. In its greatest extent it is above seventy miles, and in its greatest breadth twenty-eight.

It is a very mountainous country, but has some fruitful tracts, as also good meadow and pasture lands, with great quantities of timber, pit-coal, iron, and other ores. In the upper parts near the Rhine are vineyards.

The Rhine, which flows to the east of this country, receives into it all the other rivers, as the Sieg, into which the Agger pours itself, and the Wipper: the Roer, which flows out of the county of Mark, runs to the northward through the narrowest part of this dutchy, and in Cleve falls into the Rhine.

There are here eleven towns, and the same number of boroughs, in which are manufactures of cloth, linen, and steel. The state of religion here is the same as in the dutchy of Juliers.

This state is divided into sixteen prefectures, the principal places in which are the following:

Dusseldorf, or Dusseldorp, a city seated on the Rhine, in the fifty-first degree thirteen minutes north latitude, and the sixth degree fifty-eight minutes east longitude, twenty-three miles to the north-east of Juliers. It has its name from the rivulet of Dussel, which runs through it, and afterwards falls into the Rhine, over which is a bridge of boats at this place. This city is not large, though it is populous and strongly fortified. The New Town, which the elector John William caused to be built before the gate of Berg, consisted of one broad fine built street; but it has fallen to decay. In the town is the old princely citadel seated on the Rhine, and commands a fine prospect. It has two galleries, the uppermost of which consists of five rooms, which are adorned with paintings by the greatest masters, as Titian, Julius Romanus, Rubens, Van Dyck, Paul Veronese, &c. and also with excellent statues of brass, antiques, and the like. Under this gallery is another which contains statues in marble and plaister, which are copies of the most celebrated statues at Rome and Florence. In the

The citadel is the seat of the aulic-chamber, and in the square opposite to it is an equestrian statue of metal erected to the honour of the elector John William. In the collegiate and parish-church are the tombs of the antient dukes of Juliers and Berg. The Jesuits have also a college, a gymnasium, and a seminary, together with a beautiful chapel. In the town are likewise some monasteries and nunneries, as also a Lutheran and a Calvinist church. Before one of the gates is a chapel built after the model of the house of Our Lady at Loretto, and adorned with fine paintings; and in the year 1752, a riding-academy was founded here.

Bensberg, a fine pleasure-house belonging to the sovereign, built by the elector John William. It stands three leagues from the Rhine, and is built with a very hard stone; but the ornaments, particularly the columns that support the gallery in the front, are a kind of grey marble, dug out of the neighbouring quarries. The apartments are large, and adorned with the finest paintings; besides which they have a most extensive prospect as far as the city of Cologne, over the Rhine and all the flat country. This seat is said to have much the air of Versailles, though it is neither so large nor so lofty. The structure was designed by an Italian; but the outside is censured, on account of the multiplicity of its ornaments.

Fifteen miles to the north of Duffeldorf is Essen, an imperial city famous for a noble and rich abbey, founded about the year 877. The abbess is a princess of the empire, and to her the greatest part of the city is subject, as are also several large manors; and her deputy has a place in the diet among the prelates of the Rhine. Their revenues were at first settled for the abbess, fifty-two nuns, and twenty canons; but they are since retrenched, and none admitted but the daughters of noblemen, who may marry at pleasure. The king of Prussia is protector of the abbey, and both in the city and cloister the people are allowed the free exercise of religion. The magistrates are Lutherans; but it has also some Roman catholic churches, and a commandery of the Teutonic order. The city is pretty large, and is a place of trade; some good cloths are made there; but the making of fire-arms, for which it was once famous, is fallen to decay.

S E C T. X.

Of the Principality of Mors: the Counties of Tecklenburg, Lingen, and Ravensberg; with the principal Places in each.

THE principality of Mors is encompassed by the dutchies of Cleve and Berg, the archbishopric of Cologne, and the dutchy of Gueldres; it being little more than nine miles in length, and as many in breadth.

It abounds in corn, cattle, and venison. Its limits are washed by the Rhine, and it is likewise watered by several small rivers and brooks. It belongs to the king of Prussia, who on account of this principality has a particular seat and voice in the council of the princes of the empire.

This principality has its own peculiar regency, who manage every thing relating to the affairs of the sovereign; together with civil, criminal, and ecclesiastical concerns: but what relates to war and the police, is conducted by the tax-council, which is under the direction of the war and domain-chamber. From the territories of this principality the king annually receives about thirty thousand rixdollars.

The principal place in this little principality is Mors, a small fortified town which contains a citadel, and is the place where the provincial colleges hold their meetings. It has a Calvinist church, and a Latin school.

Crefeld is also a small town, in which is a citadel; but has manufactures of velvet, silk, linen, and other articles.

The county of Tecklenburg terminates to the north and east on the bishopric of Osnabrug, and to the south and west on that of Munster, extending about twenty-three miles in length, and about ten in breadth.

It has a sufficient quantity of land capable of bearing all sorts of corn, with a good breed of cattle, and plenty of fowl and venison. Its rivers and brooks abound with fish: these are the Hase and the Date; and in the mountains are quarries of stone. A great deal of linen is made and exported from this country.

In the beginning of the Reformation count Conrad introduced the Lutheran doctrine; but count Arnold, of Bentheim and Tecklenburg, his daughter's son, bringing in the Calvinists, the whole country embraced their sentiments.

The king of Prussia, on account of this country, enjoys an additional seat and voice in the Westphalian college of imperial counts, and also at the diets of the circle of Westphalia. The sovereign's domains in this county bring in annually about twenty-four thousand rixdollars. The amount of the taxes, excise, &c. is included in the sum mentioned above under Minden.

The places in this county are too inconsiderable to deserve description.

The county of Lingen is surrounded by the bishoprics of Munster and Osnabrug, and in part by the county of Tecklenburg. The soil of the country is in general not very fertile. In the upper country are some coal-pits and quarries of stone.

The prevailing church here is the Calvinist; but the greatest number of the inhabitants of the country are Roman catholics; for at the time of the Reformation count Conrad was obliged to resign this part of the country to popish lords, and it became entirely under the Spanish dominion.

Lingen is under one common government with the county of Tecklenburg; and with respect to the police and other affairs, it is under the domain-chamber of Minden, which has a deputation college at Lingen.

The royal annual revenues arising from the domains, contributions, and excise, are estimated at about eighty thousand florins.

This country is divided into the Upper and Lower County, the principal place in which is

Lingen, the capital, which is seated near the Ems, was formerly fortified, but at present is barely surrounded with a ditch. It is the seat of the regency of the united counties of Lingen and Tecklenburg, and of the deputation of the war and domain-chamber of Minden. It has a church belonging to the Calvinists, another belonging to the Lutherans, and a third possessed by the Roman catholics. It has also a seminary, founded in the year 1697 by William III. king of England.

The county of Ravensberg is environed by the bishoprics of Munster and Osnabrug, the principality of Minden, the counties of Schauenburg and Lippe, the bishopric of Paderborn, and the county of Rittberg.

Its soil is in some parts sandy; but in others bears corn, flax, and hemp; and the pastures are in some places very good.

The Weser separates this county from the principality of Minden, and is of great advantage to the commerce of the inhabitants. Its other rivers are the Rehme, the Werre, the Aa, the Elfe, the Warmenau, the Hessel, and the Lutterbach.

Most of the inhabitants are Lutherans, who have thirty-three parish-churches; but the Calvinists enjoy the public exercise of their religion only at Herford and Bielefeld; though the Papists are possessed of churches not only in those towns, but in three others. A certain number of Jews are also tolerated.

The most profitable employment of the inhabitants consists in spinning and weaving of linen. There are not only many thousand weavers in this county, but considerable quantities of linen are also brought from the neighbouring countries to Herford and Bielefeld, where they are bleached and sold. Both the fine and coarse linen made here is exported all over Europe, and also to America. At Bielefeld is also a manufacture of stockings, and at Herford of stuffs.

This county is subject to the electoral house of Brandenburg, and in 1716 was placed under the regency of Minden. Its principal towns are the following:

Bielefeld,

Bielefeld, the capital of the county, is seated at the foot of a mountain, and on the banks of the Lutterbach, which runs through the town. It is well built, and contains near eight hundred dwelling-houses; with two principal churches belonging to the Lutherans, viz. that of St. Nicholas, at which the superintendant of the county is upper preacher; and that of St. Mary, in which is a chapter, consisting of seven Lutheran and five Roman catholic capitulars. There are here also a Calvinist church, a Popish chapel, and a Franciscan monastery, with a church in it; an infirmary, in which is a Lutheran chapel; an orphan-house, in which is a stocking manufacture; a spinning-house, a house of correction, and a Latin school. In the town are also seventeen squares. The nobility hold their provincial diets here, and in this place keep their archives. It was formerly a Hanse-town; at present the principal employments of the inhabitants consist in weaving and bleaching of linen.

Herford, formerly Hervorden, is watered by the rivers Werra and Aa, which run through the city, dividing it into three parts. That in the middle is called the Altstadt, and contains three hundred and sixty-two burghers houses, a Lutheran church, and a cloyster of Grey friars. About one-third of this part is called the Liberty, and contains the abbey, which is an imperial, free, secular foundation, and its abbess, who is styled a princess and prelates of the holy Roman empire, sits at the diet among the abbesses on the Rhenish bench, and at the diets of the circle of Westphalia. This foundation is Lutheran, and the chapter consists of a deaconess, a female churchwarden, and a number of canoneses of the state of princesses and countesses, of whom the abbess may receive any number she pleases. The abbess Johanna Charlotte, princess dowager, erected an order at this place, in the year 1729. The cross is pendant to a scarlet ribbon, bordered with silver, hanging from the right shoulder to the left side. On one side is the Virgin Mary standing, with the child Jesus, and the inscription *MEMINISSE ET IMITARI*; and on the other the name of the abbess. The canoneses also bear a star on their left breast, in which is represented the Virgin with the child Jesus.

In the Altstadt are also the court-chapel, the chapel of St. Anthony, and the Juliers and Westphalian courts.

The second part of the town, which lies to the north-east, is called the Neustadt, and contains three hundred and nineteen houses belonging to the burghers; the Lutheran church of St. John the Baptist, in which is a chapter of twelve capitulars, one of whom must be a Roman catholic; the brother-house, the sister-house, with the commandery-court of the order of St. John, in which is a chapel.

The third, and smallest part of the city, which lies to the west, is called the Radewig, and contains a hundred and twenty-six houses belonging to the burghers, with the Lutheran church of St. James. Thus there are eight hundred and seven houses of the burghers in the different parts of the city. within the walls are also spacious courts and gardens, many vacant places where the houses have been burnt down, some pasture ground, and a small corn-field.

On the mountains opposite to Herford, at the distance of about six hundred paces from that city, is the collegiate church of St. Mary, a noble, free, and secular foundation, consisting of a female dean and provost, with a female churchwarden, and nine other ladies of the foundation, all of noble birth, the superior of whom is the abbess of the above foundation in the city. These ladies also wear the sign of the order, with the star on the left breast.

SECT. XI.

Of the Counties of Schauenburg, Hoya, and Pyrmont; with the principal Places in each.

THE county of Schauenburg is seated on the Weser, and is surrounded by the principality of Hanover, the counties of Lippe and Ravensberg, and the princi-

pality of Minden; extending near thirty miles from north to south, and twenty from east to west.

It is in many places very mountainous; but yet contains a great deal of fertile land, with some excellent pastures, and considerable quarries of free-stone. It has also an allum mine, and pits of excellent coal. Its rivers abound with fish: these are the Hamel, the Caspaw, the Weser, and the Exter. It has also a lake, which is five miles long, two broad, and about sixteen feet deep.

In the whole country are only seven little towns, and three boroughs. The inhabitants chiefly subsist by agriculture and the breeding of cattle; most of them are Lutherans; but the Calvinists are allowed the public exercise of their religion.

This country belongs to the king of Great Britain, the landgrave of Hesse-Cassel, and the count of Schauenburg-Lippe; the two last are possessed, by virtue of this county, of an additional seat and voice in the college of the Westphalian counts of the empire, and in the circle of Westphalia. The whole county brings in annually about a hundred thousand rixdollars to its princes.

The principal places in this county are the following:

Stadthagen, in Latin Haga-Schauenburg, is seated in a level and pleasant spot, and is encompassed with ditches, a rampart, walls, and several towers. The citadel is at present the residence of the princess Charlotte Frederica Amelia, countess dowager of Schauenburg-Lippe. Prince Ernest founded a seminary in this town, which in 1619 was raised to an university, which in 1621 was removed by that prince to Rinteln. To the east of the Lutheran church stands the costly mausoleum of prince Ernest, consisting of an heptagonal tower of hewn-stone covered with plates of copper, in which is to be seen an excellent monument of marble and brass, representing Christ's tomb guarded by the watch, and out of it our Saviour rising triumphant. Here is an orphan-house, founded in 1738 by Johanna Sophia, countess dowager to count Frederic Christian, and for the most part formed after the model of the orphan-house at Hall. Here was also a Franciscan cloister, of which nothing now remains but the church, one-half of which has been repaired, and allowed the Calvinists, for the use of their public worship.

Buckeburg, a small town, defended by a citadel, is seated twelve miles to the west of Schauenburg. It has a large and beautiful church, and of late years has been much adorned with fine houses. It has a fountain in the market-place, and the count has a palace erected in a magnificent taste after the Italian manner. Here is a school belonging to the town, and the Calvinists have a peculiar church and an orphan-house.

Schauenburg is an old ruinous citadel, seated on a high mountain between the towns of Rinteln and Oldendorf. This fort gave name to the whole country; but the fort itself obtained the name from the extensive prospect it affords, the word Schauenburg signifying, in German, Seeingtown, and the hill on which it stands is named Oelberg, or Eye-mount.

Rinteln is a fortified town, seated on a tract environed by mountains, and lying between the Weser and the Exter. Over the former is a bridge of boats from March till the beginning of December. The university, as well as the town, belongs at present to Hesse-Cassel. The professors of divinity are of the Lutheran religion; but those in the other faculties are Calvinists. The Lutherans have the town-church, but the Calvinists and the garrison make use of that which belongs to the university. The town is environed by ramparts, ditches, and bulwarks. The inhabitants chiefly apply themselves to agriculture, the breeding of cattle, and brewing.

The county of Hoya is bounded on the north by the county of Delmenhorst, the territory of the city of Bremen, and the Weser; on the east by Lunenburg and Hanover; on the south by the principality of Minden; and on the west by the county of Diepholz; extending about thirty-eight miles in length, and about thirty-three in its greatest breadth. It has some large heaths, and its soil is for the most part sandy; but it contains arable land and pasture, and yields as much rye, oats, and buckwheat as the inhabitants have occasion for; and in some parts are produced good wheat, barley, and flax.

The

The rivers are the Weser, the Aller, the Delme, and Hunte. This county has only one city, and seventeen boroughs. The inhabitants in general apply themselves to agriculture, the breeding of cattle, and the keeping of bees; to spinning, the weaving of linen and woollen stuffs, and the knitting of stockings. They are all of the Lutheran church, and the country contains fifty-four parishes.

The electoral house of Brunswic possesses, on account of Hoya, an additional seat and voice in the college of the counts of Westphalia.

In this county are no places of any consequence, and therefore we shall not trouble our readers with any account of them.

The county of Pymont is bounded on the north and east by Hanover, and on the south and west by Hanover, Wolfenbüttele, and the territory of Paderborn. The lower part of the county consists of an uncommonly beautiful and pleasant vale, through which runs the Emmer, and all around it is environed by lofty green mountains; and in it are the celebrated mineral springs. The religion of the inhabitants is the Lutheran, and they have a superintendent that resides at the capital.

The arms of this county are an anchor-cross in a field argent. The prince of Waldeck, on account of this small country, enjoys both a seat and voice in the Westphalian college of the counts of the empire, and also at the diets of the circle of Westphalia. His annual revenues arising from this county are estimated at near thirty thousand rixdollars, to which the mineral springs and salt works chiefly contribute.

This county contains the citadel and New Town of Pymont, with ten villages.

The citadel of Pymont is fortified with a broad ditch, high ramparts, and subterraneous passages. From the ditch of the citadel a canal has been carried quite down to the spring, where is a mineral fountain, which rises about twenty feet high. A little above is a house in which an assembly is held, and near it is the house that incloses the spring: about forty feet distance from this fountain-head rises the great bubbling spring, which is used for bathing, and makes a great noise; and at a hundred and twelve feet distance to the west lies the lower spring, which is the weakest of them all.

The New Town of Pymont is seated between the spring and the village of Oestorf. To the south of it stands an orphan-house, and on the north is a good stone-quarry, in which is a pit resembling the grotto del Cane near Naples, from which strong sulphureous fumes ascend, and over which, in the year 1720, a stone-vault was built. About thirty rods from this sulphureous cavern rises a brisk spring, the waters of which are of a pleasant, vinous, acid taste.

SECT. XI.

Of EAST FRIESLAND.

Its Situation, Extent, Produce, and Rivers. The Languages and Trade of the Inhabitants. The Manner in which it became subject to Prussia: its Arms; the Revenue the Prince receives from it, and its principal Towns.

THE principality of East Friesland receives its name from its situation with respect to Friesland, one of the United Provinces, and is bounded on the north by the German sea, on the east by the county of Oldenburg, on the south by the bishopric of Munster, and on the west by the province of Groningen and the German sea, extending from north to south forty-five miles, and from east to west about forty-two. This principality has a moist and thick air; but it is frequently purified by the sea breezes. Spring and summer appear here somewhat later than in other parts of Germany. The country throughout is level and low, whence it is secured by expensive dykes against the inroads of the floods. Along the sea-coast lies a marsh that is uncommonly fertile; but is more used for meadow and pasture than for agriculture. Indeed the pastures here are remarkably good, and produce horned cattle, horses, and sheep in great numbers, and of an extraordinary size. The milk of the

cows, which is remarkably rich, is yielded in great quantities, and of it is made excellent butter and cheese. In the heart of the country the soil is for the most part sandy, and in some places fenny; but yields turf for burning, which, from the great scarcity of other fuel, is of the highest advantage. The produce of the earth, and particularly kitchen-herbs, here grow to a larger size than in other countries; but are seldom so good. Venison and fowl are also to be had here, and in this country are geese that weigh twenty-four pounds and upwards. In harvest a great number of fieldfares and snipes generally appear.

The principal river of this country is the Ems, which here receives into it the Leda, or Soesta, and at last runs into the German sea. Near the place of its efflux it is very broad, and, dividing into two branches, surrounds the island of Borcum. The ebb and flood are to be observed here nine miles up in the country, and so high the salt-water comes.

Between East Friesland and Groningen is a bay called the Dollart, which rose out of a considerable tract of country that was swallowed up by the sea, on which were many villages; but the Dollart now decreases greatly on the East Friesland side, yielding much new land, which has been gradually dyked in. The sea here affords oysters, muscles, crabs, and a variety of other fish.

The languages spoken here are the East Friesian, the German, and Dutch; and in the last sermons are preached in many places near Groningen. Next to the Lutherans the Calvinists are the most numerous. In the town of Embden, and in the lordships of Godens and Lutzburg, the Roman catholics enjoy the quiet exercise of their religion; as do the Mennonites at Embden, Leer, and Norden. In this county are also a number of Jews.

Trade and navigation are briskly carried on here. The produce of the country and the commodities exported from hence are large horses, numbers of which are sent by sea even to Rome, and sold by the pair for coach-horses, for three or four hundred dollars, and more, according to their strength and beauty; horned cattle, butter, cheese, rape-seed, winter-barley, and fine linen made at Leer and Godens. On the other hand, every thing wanted in the country, that is either necessary or convenient, is conveyed thither in ships; and at Embden the king of Prussia has established an Asiatic company.

The princely house of East Friesland becoming extinct by the death of prince Charles Edward in 1744, the king of Prussia, in consequence of the expectancy granted to the house of Brandenburg by the emperor Leopold in the year 1694, took possession of the country; but the illustrious house of Brunswic-Lunenburg declared and made known to the regency of East Friesland, and the whole body of the states, its rights obtained, by means of a brotherhood, and an hereditary union entered into in 1691 with prince Christian Eberhard; and also made proper declarations to the aulic-council of the empire against the suit of the king of Prussia, for being invested with the possession he had seized.

The arms on account of East Friesland Proper are, an harpy or, bearing a coronet, with wings expanded in a field sable, and having two stars or, in the four corners of the field.

The prince of East Friesland has a seat and voice in the council of the princes of the empire, and at the diets of the circle of Westphalia.

The revenues of East Friesland, it is said, greatly exceed a hundred thousand rixdollars. The regency consists of two senates, and is held at Aurich. These senates, with the assistance of the general superintendent and town minister of Aurich, constitute the consistory. The other officers are the war and domain-chamber, the provincial-college, which collects, administers, and computes the taxes and contributions, and a provincial medicinal-college.

The principality of East Friesland consists at present of three towns, and nine prefectures that were formerly lordships; but are now, as well as the towns, become hereditary states of the sovereign prince: it has also lordships that have their own hereditary lords; but are subject to the supreme jurisdiction of the prince.

The principal places of this principality are,

Aurich, the antient residence of the prince, and still the seat of the provincial colleges, stands in the center of the country. The antient residentiary castle is environed with ramparts and ditches, and the Calvinists at present perform their religious worship in the garrison church. There is here also a Lutheran church, a provincial house, a Latin school, and a public alms-house. The magistracy consists of two burgomasters, two counsellors, and one secretary.

Embsen, a large and strong sea-port town, seated on the Ems, in the fifty-third degree five minutes north latitude, and in the seventh degree twenty-six minutes east longitude. On the land-side it is fortified by a double ditch, bulwarks, and bastions, and on the other by a strong wall and the river; it has also an old fort and a citadel, and by means of sluices the country around it may be laid under water. The harbour is one of the largest and most convenient in Germany, which renders Embsen a place of great trade. The houses are neat and lofty. It has a fine council-house, to which ships may arrive by means of a broad canal drawn from the Ems, called the Dolf. Among the public buildings are what is named the Great church, the Guest-house, in which is a church, and the New church, all which belong to the Calvinists, and a Latin school. Here are also many Lutherans, and likewise Roman catholics, Mennonites, and Jews. The town has annexed to it several lordships which lie to the east; the inhabitants of which are Calvinists.

Norden is seated at a small distance from the German sea, and is the oldest town in East Friesland. It is open, but pretty large; it has a good harbour, and is a place of trade. It has a Lutheran church, with a Latin school, and a guest-house, that was formerly a cloister; there are here, likewise, some Calvinists and Mennonites. Its jurisdiction is under the prince's administrator, the burgomaster, and council.

SECT. XII.

Of the Counties of Oldenburg, Delmenhorst, Bentheim, and Steinfurt.

THE county of Oldenburg is bounded on the west by East Friesland, on the south by the bishopric of Munster, on the east by the county of Delmenhorst and the Weser, and on the north by the signiory of Jever and the Jade; extending forty-eight miles in length, and thirty-eight in breadth. In some parts it is pretty fertile, and has excellent pasturage, which produces a good breed of horned cattle and horses; but has a great deal of moorish land of no other service but for producing the turf which is here used for burning. The land is secured against inundations by large and expensive dykes and dams.

This country is subject to the king of Denmark, who on this account is possessed of a seat and voice in the Westphalian college of the counts of the empire, and in the diets of the circle of Westphalia.

Oldenburg, the capital of the county, is situated on the river Hunte, which receives into it the Haare, as it passes through the town, in the fifty-third degree eight minutes north latitude, and in the eighth degree thirteen minutes east longitude. The town stretches out in length, and is well fortified with walls and ditches. It has also a handsome round castle, in which its antient counts used to reside, and is built of free-stone three stories high. In the principal church, which is that of St. Lambert, is the burial-place of the counts of Oldenburg, and there are two other churches. The town consists of what are termed free houses, free inhabitants, and the garrison. The free inhabitants are exempt from all such burthens as those to which the burghers are subject, as the quartering of soldiers and keeping watch; these constitute nearly one-third of the inhabitants, and are solely subject to the chancery of the royal regency established here; but the burghers are under the town magistracy, and the garrison under the commandant.

The county of Delmenhorst, which lies between the county of Oldenburg and the Weser, is about seventeen miles long and seven broad, and likewise belongs to the king of Denmark, who on this account also enjoys a particular seat and voice in the college of the Westphalian counts of the empire, and also at the Westphalian diet.

Its principal town is Delmenhorst, which is seated on the little river Delme, from which it received its name. It had antiently a college of canons, the revenues of which were applied in 1575 to the maintenance of the churches, schools, and the poor.

The county of Bentheim has the United Provinces on the north and west, and the bishopric of Munster on the east. It is about forty-five miles in length, and eighteen in the greatest breadth.

This country is both fertile and pleasant. In the mountains are excellent quarries, from which stones are conveyed to the Netherlands and the bishopric of Munster. In the plains are fruitful fields, with good meadow grounds. The woods afford excellent timber and game; and there is here a good breed of cattle. The principal river of this county is the Vecht, which runs through its whole length, and may be navigated for the greatest part of the year with small craft and floats of timber, and is very rich in fish.

The inhabitants are laborious and deal in yarn, wool, linen, cattle, honey, stones, wood, and other articles, which are chiefly exported to Holland. Some of the inhabitants are of the Calvinist religion, and others Lutherans; but the former are the most numerous: there are also a considerable number of Roman catholics; but they are permitted the public exercise of their religion only at Bentheim.

The count of Bentheim-Bentheim enjoys a seat and voice in the college of the Westphalian counts of the empire, and in the diets of the circle of Westphalia.

The principal town in this county is

Bentheim, which stands partly on a mountain, and partly on a river of the same name. The place of residence for the counts stands on a remarkable high rock, and is surrounded with towers. In this town is a Calvinist parish-church, and a church belonging to the Roman catholics.

The county of Steinfurt is nearly twenty-three miles long, and the south tract only seven, but the northern twelve miles broad. The Aa, which rises on its southern limits, traverses the whole country, and at length discharges itself into the Vecht.

The count of Bentheim-Steinfurt, who is descended from the same family as the count of Bentheim-Bentheim, has also a seat and voice among the counts of the empire in the Westphalian college, and in the diets of that circle.

The only town in this county is Steinfurt, which is situated on the Aa. The inhabitants are for the most part Calvinists, who have here a church, and the Roman catholics another. The celebrated seminary in this town, called *Arnoldinum*, from its being founded by count Arnold in 1591, has five professors, with six preceptors, and was formerly very flourishing. Just by the town is a commandery of the order of St. John.

SECT. XIII.

Of the free imperial City of AIX LA CHAPELLE.

THE imperial city of Aix la Chapelle, called by the Germans Aachen, or Acken, and in Latin Aquigranum, is seated between the dutchies of Juliers and Limburg, in a valley surrounded by hills, woods, and vineyards, in the fiftieth degree forty-four minutes north latitude, and in the sixth degree twenty-eight minutes east longitude. The circuit of the whole city is a league and a half. It is encompassed with two walls; the inner wall has ten gates, and the outer eleven. The town-house is a noble structure of free-stone, and one of the finest in Germany. It is adorned with all the statues of the emperors since Charlemagne, and with curious history paintings,

paintings, among which is a fine piece of the resurrection, and another of Charlemagne's giving the city her charter. The uppermost story consists of one hall a hundred and sixty feet in length, and sixty in breadth, in which the emperors used to entertain the electors and other princes, who assisted at their coronation.

In the market-place, opposite the town-house, is a noble fountain, with four springs, which run from above into a copper cistern thirty feet in diameter, and weighing twelve thousand pounds. On the top of the fountain is a large brass statue gilt of Charlemagne in armour. As the city lies in a valley surrounded with mountains, there are twenty other public fountains of clear water, besides many private ones. Without St. James's gate are ten hot mineral springs, and some cold ones, besides several in the adjacent fields. The streams that run through the city keep it very clean, and drive several mills.

With respect to the celebrated baths of this city, there are three within the inner walls, which are called the Emperor's, St. Quirinus's, and the Little Bath. Charlemagne was so much delighted with the first, that he frequently invited his sons and nobles to bathe and swim there with him; but it is now divided into five bathing-rooms. The Little Bath joins to it, and the springs of both rise so hot, that they let them cool ten or twelve hours before they use them. They are strongly impregnated with nitre and sulphur, and sometimes cakes of brimstone and salt-petre of a considerable thickness are taken out of them. Their taste is at first unpleasant, and their smell resembles that of a rotten egg. Near these baths is a spring of warm water, much resorted to in summer mornings, and drank for chronical diseases. Those in the New Town, which are the Rose Bath, the Poor's Bath, and St. Corneille's, are not near so hot and clear as the former; but they are of much the same nature, and their smell offensive. Near the hot springs lie many cold ones, by which their heat might be tempered, and with a little expence they might be made some of the most delightful baths in the world.

Here are thirty churches, besides the cathedral, which is a large Gothic pile consecrated by pope Leo III. in the presence of the emperor Charlemagne, and three hundred and sixty-five bishops. The steeple at the west end is adorned with several pyramids, and on the top is a large globe and cross. The inside of this structure has a vast number of marble and brass pillars, gilt statues, brass doors and partitions, and a great deal of Mosaic work. Over the place where Charlemagne was interred hangs a large crown of silver and gilt brass, adorned with sixteen small towers, surrounded with forty-eight little statues a foot high, and thirty-two that are still less, all of silver; among which are commonly placed forty-eight candlesticks, and at certain grand festivals no less than four hundred and fifty tapers. The four principal relics shewed here at the jubilee, which happens once in seven years, are first, what they call the gown or shift worn by the Virgin Mary at our Saviour's birth, made of a kind of flax which seems to be neither linen nor calico; but as it is only exposed from the top of the high tower, it may be either linen, calico, or any other stuff, without the people being able to discover the difference, or what garment it is. The second is a coarse linen cloth, which, they pretend, was girt about our Saviour when he hung on the cross. The third is a piece of the cord with which he was bound; and the fourth some of the earth on which the blood of St. Stephen dropt at his martyrdom, enclosed in a vessel of gold adorned with precious stones, on which the emperors were usually sworn at their inauguration.

At the end of the cathedral our Saviour is represented sitting in majesty on a throne, dressed in a long robe. Round the throne are the four animals represented in Ezekiel's vision. Over his head is a circle of golden stars, and underneath the symbol of the cross that appeared to Constantine when he defeated Maxentius. Here is also a representation of the twenty-four elders, mentioned in the Revelations, rising from their seats, laying aside their crowns, and falling prostrate before the throne.

The windows are curiously gilt, and the pavement is of chequered marble. This church contains an immense treasure, consisting of vessels of gold and silver gilt, copes embroidered with pearls, and other rich vestments. Over the chief altar is a silver chest adorned with gold; of antique workmanship, and curiously engraved, in which are kept the four relics above-mentioned. A pulpit at the entrance of the choir is covered with plates of gold and silver, and adorned with precious stones; among which is a very large agate, the gift of the emperor Henry II. The altar of the choir is covered with plates of gold representing our Saviour's passion. In the upper part of the church, opposite the prince's altar, between the pillars, is a throne or chair of white marble, supposed to have been placed there by the emperor Charlemagne, in which the emperors used to sit when consecrated, and receive the first homage of the electors and the chapter of the cathedral, in quality of king of the Romans. It is not polished, it being formerly covered with plates of gold.

This city was for a long time reckoned the capital of the empire, and the proper residence of the emperor, and in it ought to be performed the coronation of the king of the Romans, and of the emperor. Hence in the foundation of St. Mary in this city, is a part of the jewels of the empire commonly used at these coronations, as a sword of the emperor Charlemagne, a manuscript book of the Gospels, in a cover of silver gilt; St. Mary's church has also the honour of having every emperor one of its sworn canons. In general there are twenty-one religious orders of both sexes in this city, who take up almost one third of what is called the Little Town.

The greatest part of the inhabitants are of the Romish religion, and though there are also many Protestants, yet they are not permitted to enjoy the benefit of public worship; but both the Lutherans and Calvinists are obliged to go for that purpose to Vael, in the dutchy of Limburg, an hour's journey from the city. This city claims the first place on the Rhenish bench in the college of the cities of the empire, and has the second among the imperial cities that have a seat and voice at the diets of the circle of Westphalia.

The title of its magistracy is that of burgomaster, sheriff, and council of the holy Roman imperial free city of Aix la Chapelle, and its arms are an eagle displayed sable, with the head, crown, feet and claws or, in a field argent.

In this city are manufactures of cloth, copper, and brass. In 1656, it was almost entirely destroyed by fire; in 1668 and 1748, it was distinguished by celebrated treaties of peace concluded there, and in 1756, was damaged by an earthquake.

About the distance of a furlong from the south gate of Aix la Chapelle, lies the delightful village of Porcet, or Borcet, which is said to have derived its name from the wild boars that formerly abounded in the neighbouring woods. Here are many hot springs, on both sides of a small cool rivulet that runs through the village, and are conveyed by pipes and conduits into fourteen houses, in which are formed twenty-eight baths, some of which are much hotter than those in the town, and must be cooled eighteen hours before they can be used. They are for the most part five or six yards square, and their water is clear and pleasant. One quite open to the air, called the Poor Man's bath, has a spring so hot that the people scald pigs, and boil eggs with it; but it is observed, that it only hardens the yolks and not the whites. These baths are not so strong as those in the city, and consequently better for weak people; and those of all ages and conditions bathe in them for their diversion, without any danger. The village of Porcet is well built, has four handsome churches, and a nunnery of Bernardines, whose abbess is a princess of the empire; but there lies an appeal from her court to the Echevins or sheriffs of the city.

The adjacent country abounds with corn, fruit, and pasturage; the woods furnish the people with materials for building, as the quarries do with stone. They have also rich coal mines, besides others of iron, lead, vitriol, ful-

fulphur, and lapis calaminaris; and are well supplied with necessaries by the Rhine and the Maese. The territory of the city called the kingdom of Aix la Chapelle, are large and contains a considerable number of villages, and about three thousand subjects. It is inclosed on all sides with mountains; and the nobility who dwell in this territory are subject to the jurisdiction of the city.

S E C T. XIV.

Of the Principalities of Nassau-Siegen, and Nassau-Dillenburg; with the Counties of Lippe, Sayn, and Wied-Runkel.

THE principality of Nassau-Siegen lies in a tract called the Westerwalde, or West Forest, and is fourteen miles in length; but in the broadest part scarcely five. This principality is very mountainous and woody; yet contains some good arable land, and particularly good pastures, whence it has a considerable breed of cattle; but it is most famous for its iron and steel manufactories.

This principality contains one town, two boroughs, and about one hundred and fifty villages. In 1624 the Calvinists were in possession of all the churches, schools, and religious revenues: but in 1626, count John the Younger embracing the Popish religion, sought to introduce it not only into his share of the country; but also throughout the whole dutchy; however, he was never able fully to accomplish it. The line of Nassau-Siegen becoming extinct, this principality devolved to the line of Nassau-Dietz, and is possessed by William V. prince of Orange, and hereditary stadtholder of the United Provinces; who on this account has a particular seat and voice in the council of the princes of the empire, and at the diets of the circle. His revenue arising from this principality is estimated at one hundred thousand rixdollars.

This country is divided into seven prefectures, the principal place in which is,

Siegen, a town seated on the river Sieg, has an old and new citadel, the former of which was antiently the residence of the Popish, and the latter of the Calvinist princes. The Papists perform their religious worship in St. John's church, and the Calvinists in the church of St. Nicholas alone. In this town is a college of Jesuits; and in its neighbourhood are many mines and smelting-houses.

The principality of Nassau-Dillenburg is seated near the former, and is nineteen miles long, and fourteen broad. It has profitable woods, and good quarries of stone, and from its iron founderies and forges, with the trade carried on in that metal, most of the inhabitants derive their subsistence, there not being a sufficiency of arable land. In this principality rise the rivers Sieg and Dill.

This country contains five towns, and two boroughs, the inhabitants of which are of the Calvinist church.

The princes of this country had the same origin as the other princes of Nassau, and this principality is also subject to the stadtholder of the United Provinces, who likewise enjoys an additional vote on account of this principality, in the council of the princes at the diet of the empire, and in the diet of Westphalia. His revenues from this principality amounted in 1731 and 1732, to one hundred and sixty-one thousand florins.

The principal town in this principality is,

Dillenburg, which is seated on the Dill, and after its being burnt down in 1724, was better built than it was before. The palace, or citadel, is a fortification in the old taste. In the parish church are the burial places of the antient counts, and the succeeding princes. In the large park are two royal seats, and near the town is a copper foundery erected by prince Christian, in which are annually smelted about one hundred and fifty centners of copper.

We now come to the county of Lippe, which is surrounded by the counties of Rietberg, Ravensberg, Schaumburg, and the principality of Hanover. It is mountainous; but contains some arable land. Its principal

rivers are the Emmer, and the Weire, and here rises the Humme and the Bever.

The inhabitants consist of Calvinists and Lutherans; but the former are the most numerous. In the whole county, according to the Rev. Dr. Busching, are five towns, four boroughs, and fifty-two villages and hamlets.

The house of Lippe is divided into several branches, between whom the country is divided. They all stile themselves counts and noble lords of Lippe, and their arms for the county are a rose gules, in a field argent; and on account of Schwalenberg, a prefecture in this county, a swallow in its natural colours, standing on a star or, in a field gules. These counts have together but one voice in the college of the counts of Westphalia at the diets of the empire, and at the diets of the circle of Westphalia.

The principal places in this county are the following:

Detmold, a town seated on the Werre, and defended by a citadel, the usual residence of the regent house of Detmold. The town is divided into the Old and New, and has a Latin school belonging to the Calvinists that has six teachers.

Lemgow is seated on the Vega, and is the largest town in the county. The Lippehof, one of the count's palaces, was erected by count Christopher Lewis. In this place is an abbey, the abbess of which is always a countess belonging to the regent house of Lippe. There are here two Lutheran churches, one belonging to the Calvinists, and a flourishing Lutheran seminary that has seven teachers. This was formerly one of the Hanse-towns; but its antient manufactories of cloth and stuffs are much decayed.

The county of Sayn is a small district that lies chiefly in the Westerwalde, containing two prefectures, in which are three principal towns and as many boroughs. The inhabitants are a mixture of Lutherans, Calvinists, and some of the Romish religion. The margrave of Brandenburg-Onolzbach, on account of the prefecture of Sayn-Altenkirchen, and the burgrave of Kirchberg, on account of the other prefecture named Sayn-Hachenburg, have a voice in the college of the Westphalian counts of the empire; but in the circle of Westphalia both houses have only one voice among those of the counts.

The principal places in this county are, the little town of Altenkirchen, in which is the council-college of Onolzbach-Sayn, and also a chancery, with a Lutheran and Calvinist church; and

Hachenburg, a small town, defended by a citadel, in which the burgrave of Kirchberg resides; both the town and citadel are fiefs of the elector of Cologne.

The county of Wied is divided into two parts, each enjoyed by a different branch of the same family; these are the Upper county, or the county of Runkel, and the Lower county, also called the county of Wied. Hence the two counts are distinguished by the titles of Wied-Wed, and Wied-Runkel, and are possessed of a voice at the college in the diets of the empire belonging to the college of the Westphalian counts, and in the circle of Westphalia.

In the Upper county are the following places:

Runkel, a borough seated in a valley on the river Lahn, consisting of about a hundred and twenty houses, defended by a citadel which stands on a high hill, and was formerly the residence of the counts. A chancery is still kept here, and here resides the superintendent, who has the inspection of the preachers. The inhabitants subsist by agriculture, gardening, and the breeding of cattle; and

Dierdorf, a town also defended by a citadel, in which the count of Wied-Runkel at present resides. In the year 1755 the Capuchins of the Rhenish circle were allowed to build a cloister in the new built suburbs.

In the Lower county is New Wied, a small but regular built town seated on the Rhine, over which the count of New Wied and the elector of Cologne, in 1742, caused a flying bridge to be laid.

The dutchy of Westphalia terminates to the east on the bishopric of Paderborn, Waldec, and Hesse; to the south on the counties of Witgenstein and Nassau, and likewise on the dutchy of Berg; to the west on the same

and the county of the Mark; and to the north on the bishopric of Munster and the county of Lippe; extending fifty-five miles from north to south, and forty from east to west; but the dimensions both of length and breadth are unequal. It gives the title of duke to the elector of Cologne, to whom it is subject; though the duke is not reckoned among the states of this circle. This country has many woods and much venison, and in some parts abounds with corn and pasturage, and its

rivers run with an impetuous torrent from the mountains: but the towns in this dutchy, and particularly the city of Cologne, are already described in that electorate, to which they more properly belong, in treating of the electoral Rhenish circle.

There are several little counties in this circle, which we purposely omit, and also several lordships that are too inconsiderable to be mentioned in a work of this kind.

C H A P. XIX.

OF S W A B I A.

S E C T. I.

Of Swabia in general, and more particularly of the Circle of that Name. Its Climate and Produce. The Regulations with respect to the Diets of the Circle, to Religion, military Forces, and the general Government of the Country.

SWABIA, called by the Germans Schwaben, and by the French Souabe, derives its name from the Latin Suevia, the country inhabited by the antient Suevi, who were so called from their long hair, which they braided and tied, says Dr. Busching, like a schweif, or train. The greatest part of Swabia at present belongs to the circle of that name, which we shall now describe. It borders on the Upper circle of the Rhine, Franconia, Bavaria, Austria, and Swisserland, and contains about seventeen hundred and twenty-nine square German miles; it extending a hundred and ten English miles from north to south, and a hundred and thirty from east to west.

It is divided between several princes, bishops, and free cities; as the house of Austria, the dukes of Wirtemberg, the elector of Bavaria, and the princes of Baden; besides the imperial cities of Augsburg, Ulm, &c.

The air is healthy, and the soil in general fertile; and though some parts are mountainous and woody, yet the hills afford mines of silver, copper, and other metals; and the forests a great deal of pine or fir timber, besides great store of game, and a good breed of horses, horned cattle, and sheep; while the other parts yield considerable quantities of corn, wine, and flax: but we shall give a more particular account of the produce of this circle in treating of the different states into which it is divided.

The princes summoned to the diets of the circle are the bishop of Constance and the duke of Wirtemberg; but the latter is sole director, though he previously communicates to the former the deliberations that are to come before the circle. These diets are commonly held at Ulm, in time of peace twice a year. Each of the five benches has its director, who sets his seal to all the acts of the circle and other dispatches. The bishop of Constance is the perpetual director of the bench of ecclesiastical princes, as the duke of Wirtemberg is of that of the temporal princes. The directors of the benches of prelates and counts are chosen only for life. Ulm is perpetual director of the bench of the imperial towns; but Augsburg always votes first. The lesser assemblies here always consist of ten states of the circle, including the two princes nominated to it who frequently meet during the general convention of the circle, when affairs too prolix for the general assembly are to be discussed, and then they are stiled the ordinary deputation. The chancery and record-office belonging to the circle are at Stutgard, the residence of the directory of Wirtemberg. It has also stated diets, in conjunction with the circles of Franconia and Bavaria, for the assaying of coin.

In the year 1681 the military force of the empire, by a decree of the diet, was settled in time of peace at forty thousand men, and the quota of the circle of Swabia alone came to one thousand three hundred and twenty-one horse and two thousand seven hundred and seven

foot; a like assessment was also passed for the circles of Upper Saxony, Lower Saxony, Burgundy, Lower Rhine, and Westphalia. The number of troops in this circle constantly kept on foot consist of four regiments of infantry, each composed of twelve companies, one regiment of dragoons, and one of cuirassiers, each consisting of eight squadrons. The commander of the circle is stiled general field-marshal.

With respect to religion, this circle is reckoned among the mixed. It at present nominates to the imperial chamber two assessors, one of whom is a Catholic, the other a Lutheran. On the death of a catholic professor, his death is certified by the imperial chamber to the bishop of Constance, who acquaints the catholic states with this event, and by a majority of votes they elect one of the persons proposed by the bishop, or refer the nomination to him; after which the bishop presents the person to the imperial chamber. But when a Lutheran assessor dies, the imperial chamber makes it known to the duke of Wirtemberg, who certifies it to the margrave of Baden-Durlach, and the city of Ulm, by a writ from the imperial chamber, upon which, in conjunction with the other protestant states and members, they hold a meeting for the nomination of another person, who is proposed to the duke of Wirtemberg; and that prince not only presents to the imperial chamber the person thus nominated by the protestant states, but when he cannot concur with their nomination, may, as summoning prince of the circle, present another; or, when he approves the persons nominated to fill this dignity, presents them both in his own name and that of the protestant states to the imperial chamber, leaving the choice to those who are the best judges of their abilities.

Under the emperor Frederic III. the circle of Swabia was divided into four quarters, which division still continues, and on many occasions has been found to be beneficial. The head of the first is the duke of Wirtemberg, of the second the margrave of Baden, of the third the bishop of Constance and the abbot of Kempten, and of the fourth the bishop of Augsburg.

S E C T. II.

Of the Bishopric of CONSTANCE.

Its Situation, Extent, and Soil. The Titles and Arms of the Bishop: his hereditary Officers and Revenue. A Description of the Lake of Constance, and the Island Reichenau; with the Curiosities in the Abbey on that Island. Likewise a Description of the Cities of Mersburg and Constance.

THE bishopric of Constance lies on both sides of the lake of that name, and the borders of Swisserland, and is commonly reckoned among its allies; for indeed a part of it lies in Swisserland, as well as a part of it in Germany. It is seated to the south-east of Furstenberg, and to the east of the canton of Schaffhausen, extending about thirty miles from east to west, and twenty-four from south to north. In this bishopric the meadow grounds and ploughed lands turn to little account,

the soil being clayey, sandy, or marshy, and subject to inundations. In the towns and villages the only trade carried on is in wine.

The bishop of Constance styles himself, By the grace of God bishop of Constance, lord of Reichenau and Oehningen: by others he is termed The most noble prince and lord, &c. The arms of this bishopric are, a cross argent, in a field gules.

He has four hereditary officers, the hereditary marshal, the hereditary chamberlain, cup-bearer, and steward. The bishop votes in the imperial diet among the princes, sitting on the ecclesiastical bench between the bishops of Strasburg and Augsburg. The antient taxation of the bishopric in the papal treasury is two thousand five hundred florins; but in 1704 only four hundred and ten were paid for the confirmation of bishop John Francis.

The bishop's board-revenue, according to a report made from the chapter to the court of Rome in 1712, amounted only to twenty thousand florins. However, his whole annual revenue is by some authors computed at twelve or fourteen thousand pounds sterling, which is said to be chiefly raised by the toll on the lake and the Rhine. His chapter consists of twenty canons who attend the chair, and four who are expectants of vacancies.

The established religion of this diocese is the Roman catholic.

In describing the remarkable places in this bishopric, we shall begin with the lake of Constance, the broadest part of which extends into Swisserland, and that towards Germany divides itself into two arms, one of which is called the Zellersee, or lake of Zell, and the other the Bodmen, Uberlingersee, or lake of Uberlingen. In the latter is the island of Meinau, as in the former is that of Reichenau. The whole lake from Bregentz to Zell is also distinguished by two appellations; the part from Bregentz to Constance being called the Upper lake, and that from Constance to Zell the Lower lake: the latter is between twenty and thirty fathoms deep, and has along its banks near forty cities, towns and villages; yet the Upper lake surpasses it, for it has no less than fifty, and its greatest depth is said to be three hundred and fifty fathoms. Here is also its greatest breadth, for between Buchorn on the one side, and Roschach on the other, is no less than five leagues. Near Lindau and Bregentz, besides the fish commonly caught in these parts, is a kind of salmon-trout, which being pickled when full grown, are exported as a rarity. They are generally an ell and a half, or two ells long, and weigh between thirty and forty pounds. As the fishermen cannot always make a good market of such large fish, they tie a bit of wood to a line, which having passed through the fishes gills, they throw them again into the water, and tie the other end of the line to a stake near their huts. Thus, without any danger of losing the fish, they allow them a range of thirty or forty paces to swim in, and preserve them alive and sound, till they meet with a number of purchasers, or have an opportunity of selling one of them for some marriage, or other entertainment, where a fish of that magnitude is required.

In half an hour's sailing you may go from Zell to the island of Reichenau, which lies in the middle of the Lower lake, and on account of its fertility and the wealth of the abbey built there, is not improperly styled Reichenau, or Augia dives. The island is half a mile long, and abounds with fine vineyards and all kinds of fruit. The abbey is a handsome building, and so rich that the abbot had formerly five hundred vassals, and his yearly income amounted to above sixty thousand guildres. But since the year 1540, upon a representation from the bishop of Constance to the pope, that by the propagation of the Lutheran doctrines his revenues had been considerably diminished, this opulent abbey, together with that of Oehningen, were annexed to the see of Constance.

This abbey is particularly remarkable for the large emerald presented to it by Charles the Fat; but since the attempt, a few years ago, to rob the abbey, it cannot be seen without some difficulty; the prior, for its greater security, letting but few, even of the brethren of the or-

der, know where it is concealed. It is kept in a red wooden frame somewhat larger than a folio, and weighs twenty-eight pounds three quarters. Several jewellers have offered for it fifty thousand guildres per pound. This valuable stone is a parallelogram, only at one corner it is irregular, as if a piece had been broken off. At its greatest length it is three spans and a half, its short side is a span and a half, and it is two inches thick. Upon it is scratched the initial letters of some names; but such fancies are now no longer permitted.

In the church belonging to this abbey lies the above emperor Charles the Fat, once distinguished by his power, and the amazing extent of his dominions, but afterwards forsaken by every one; so that he died in extreme indigence, or was put to death by his own people at Neidingen, on the Danube, in 888. In the sixteenth century his tomb was repaired, and an epitaph added, which says, That "Charles the Fat, king of Swabia, and great-grandson of Charlemagne, having by force of arms entered Italy, and subdued it, was crowned Cæsar at Rome, and obtained the Roman empire; also, upon the death of his brother Lewis, all Germany and France fell to him by right of inheritance. But at length failing in courage, and growing weak in body and mind, he was, by a strange reverse of fortune, forsaken by all his friends, and buried in this obscure place. This tomb-stone is at present removed, and the building of the new sacristy occasions the grave itself to be concealed."

Upon the altar of this church the monks pretend to shew one of the water-pots used at the marriage at Cana in Galilee, of which upwards of twenty are shewn in other places, all of a different magnitude, colour, and shape. The convent also boasts of being possessed of the body of St. Mark the Evangelist; but this is disputed with them by the Venetians.

The next place we shall mention is Merzburg, or Morfpurb, a city seated on the lake of Constance, and the usual residence of the bishop, containing a seminary for the secular clergy and a convent for Dominicans. In the year 1647 the palace here was burnt down by the Swedes. The country in the neighbourhood of this city produces plenty of wine, and near it, in the lake, stands a cross on which is an inscription, importing that the lake is there two thousand nine hundred fathoms broad, and a hundred and eight deep.

Constance is an antient city seated on the lake of the same name, in that part where the Rhine issues out of it, in the forty-seventh degree forty-two minutes north latitude, and in the ninth degree ten minutes east longitude. It was formerly an imperial city, but in 1548 was put under the ban by the emperor Charles V. it having then deserted the popish religion; but the next year Ferdinand I. brought it under the power of the house of Austria; and though the states of Swabia refused their assent, yet its subjection was ratified at the diet of Augsburg in 1559. The town is fortified, and has on the other side of the Rhine the fort of Petershausen for its defence. This city is of a middling size, and towards Lindau makes a good appearance; but the burghers are thought not to exceed five hundred and fifty. The pulpit of the cathedral is supported by a statue of John Huss, who was here sentenced to be burnt, and his being made to serve as a pedestal to the pulpit was intended as a mark of farther disgrace, though it seems more natural to admit of an honourable construction. It is here the current opinion among the superstitious vulgar, that the place where that reformer was burnt is cursed, so that no grass will grow upon it. Our guide, says Mr. Keyser, who was a substantial citizen, but a Roman catholic, was so infatuated with this notion, that he maintained it while we were walking about the place, which was covered with verdure; so that had we thought proper to enter into the dispute, we might have convinced him by appealing to his very senses.

It was once a rich city, and has a tolerable trade, by means of the lake and the neighbourhood of the Rhine. It is well built, and strongly fortified. The churches are magnificent, particularly St. Stephen's cathedral, though it is old; and the exchange, town-house, markets, bridges, and other public buildings, with the bishop's palace,

palace, are handsome structures. The suburb on the north side is separated from the city by the Rhine, over which is a bridge three hundred and thirty-six paces in length, under which is said to be a mill that moves sixteen mill-stones at once. The Jesuits have a college here, and an indifferent church; besides which here are five convents of friars, two nunneries, and four parish-churches.

This city has been famous for its councils. Thus in 1044, or 1045, an assembly of princes met here under the emperor Henry III. and put a conclusion to the troubles of Germany by what is called the peace of Constance, at a juncture when there were three popes, who were set aside, and a new one chosen, who in 1056 took the name of Clement II. In 1414 a council was also held here, summoned by the emperor Sigismund, upon three popes pretending to infallibility; one set up by the Italians, a second by the French, and a third by the Spaniards, who were all three deposed by this council, and Martin V. chosen in their room. The same council condemned the doctrines of John Wickliff, John Hufs, and Jerome of Prague, causing the bones of Wickliff to be dug up and burnt, and John Hufs and Jerome of Prague to be cruelly burnt alive, though the former had a safe-conduct granted him by the emperor; and this cruel and infamous council, which appears to be the most numerous ever held upon any occasion, made the canon, "That faith is not to be kept with heretics, nor with those suspected of heresy."

S E C T. III.

Of the Bishopric of AUGSBURG.

Its Situation, the Prerogatives of the Bishop, his Arms, and Revenue; with a particular Description of the City of Strasburg.

THE lands belonging to the bishopric of Augsburg lie scattered between the rivers Lech, Iler, and the Danube; but the greatest part of them near the former. This country extends beyond the Lech to the diocese of Ratisbon and Freysingen; southward to those of Brixen and Chur; westward to the bishopric of Constance, from which it is separated by the Iler; and northward beyond the Danube, to the bishoprics of Eichstatt and Wurtzburg. That tract of it which lies towards the Tirolese is very mountainous; but the rest principally consists of fine corn-land and pastures.

The prince and bishop of Augsburg sits and votes in the college of princes, between the bishop of Constance and Hildesheim, and in the diet of the circle of Swabia possesses the second seat among the ecclesiastical princes; he is also the head of that fourth quarter of Swabia, which lies between the rivers Lech, Danube, and Iler.

The arms of this bishopric are party per pale gules and argent.

The chapter of the cathedral consists of forty persons of quality, who must give proof of their nobility for sixteen descents. The temporal and spiritual colleges belonging to the diocese are the general vicariate, the ecclesiastical council and consistory, the regency, the treasury, and the court of fiefs. The episcopal revenue is estimated at near a hundred thousand rixdollars.

This bishopric is divided into fourteen prefectures, the principal places in which are the following:

Dillingen, the residence of the prince, is situated on the Danube, and had formerly counts of its own to whom it gave title. There is here an university, in which is a college of secular canons. In this town is also a college of Jesuits, with a convent of Capuchins, and two nunneries.

But the principal city in this bishopric is the imperial city of Augsburg, originally called Vindelica, and afterwards Augusta Vindelicorum, or Rhætorum, which lies in a fertile, healthy, and delightful country, in the forty-eighth degree twenty-three minutes, and in the tenth degree fifty-nine minutes east longitude, between the rivers Lech and Wertach, which unite near this place. Its utmost extent is about nine thousand common paces, and its length from the Red-gate to Fisher-gate four

thousand. The city is environed with ramparts, walls, and deep ditches, and has four large and six small gates, and between some of them a wicket of curious contrivance for admitting persons in the night-time. It is commonly divided into three parts; but others divide it into the Upper, the Middle, the Lower Town, and the suburb of St. James. Some of its streets are steep; but below these, it has others that are broad, and well paved, whence it may in general be termed a fine city. Besides the cathedral it has six popish parish churches, five monasteries, among which is a Jesuits college, the abbies of St. Ulrich and Afra, three nunneries, and six Lutheran parish churches, to which belong fourteen ministers, and a Lutheran gymnasium, in which is a good library. In the year 1755, the imperial Franciscan academy for arts and sciences was founded here. It has also several hospitals for the poor, for orphans, and sick people, with other charitable foundations.

But to be more particular, the town-house, which is reckoned the finest in all Germany, was completed in the year 1620, after being six years in building. At the top of the front, just below the pediment, is a large spread eagle cast in brass and crowned, said to weigh twenty-two hundred weight, and to have cost fifteen thousand German florins, or above one thousand eight hundred and seventy pounds sterling; it holds with its talons a gilt sceptre and globe. The great portal, which is twenty feet in height, and twelve in breadth, is of very beautiful red marble, adorned with a balcony supported by two handsome columns of white marble. In the great hall next the street are eight large pillars of red marble, fourteen feet and a half high. Here the city mainguard is kept, and are provided with six field pieces. Round the room are brass busts of the twelve Cæsars. In the upper story is a still larger hall supported by Corinthian columns of red marble, with bases and capitals of brass; the chambers contiguous have abundance of historical and political paintings, with well chosen sentences, exhorting the judges to observe impartial justice, prudence, peace, and the fear of God. In the third and uppermost, called Golden-hall, are fifty-three windows, which render it extremely light; but it has no columns, and instead of being arched, the ceilings are divided into a number of little brown and gilt compartments, on which as on the walls are good paintings. The floor is of red, white, and grey marble; but in the other halls only of white plaster. The height of this upper hall is fifty-two feet, and its breadth fifty-eight, and its length one hundred and ten. This noble room is adorned with fine pictures. The four contiguous chambers in which meetings are held for assaying of the coin, giving audience to envoys, and for other important affairs, bear the appellation of the four princes chambers, as having been the residence of the four electors who assisted at the election of Ferdinand IV. king of the Romans, in 1663. Every part abounds with historical paintings illustrated by ingenious inscriptions. The whole breadth of the town-house is one hundred and forty-seven feet, and the length of the front one hundred and ten; its height towards the west one hundred and fifty-two; but its eastern height measures one hundred and seventy feet.

In a square near the town-house is the fine fountain of Augustus, the most splendid in the city. It is a large marble basin surrounded by an iron balustrade, admirably wrought, with four brass statues as big as the life upon the edge, two of men, and two of women, supposed to represent four little rivers, the Lech, Wertach, Sinkel, and Source. In the middle of the basin rises a square pedestal, at the foot of which are four large sphinxes with water streaming from their breasts. A little above them are four infants holding four dolphins in their arms, from whose mouths the water spouts in plenty, and over these infants are festoons and pine-apples, all of brass. Upon the pedestal is a brazen statue of Augustus crowned with laurel, and armed after the manner of the antient Romans.

The most beautiful fountain next to this, is that called the fountain of Hercules, which has a large hexagon basin with several brass figures, particularly one of Hercules combating the hydra, which are by many good judges

judges esteemed better executed than those of the former.

The tower called Berlach, which stands near the town-house, has three hundred steps to the top, and above the weather-cock is the statue of a woman. In an area near this structure is a very fine tower adorned with the four seasons in brass, and in the center is the statue of the emperor Augustus with apposite inscriptions.

In the bishop's palace, which is but a mean building, is shewn the hall in which the Augsburg confession was presented to the emperor Charles V.

On the brass door of the cathedral is represented the virgin Mary taking Eve out of Adam's side. The monks of St. Ulric dispose of a dust or powder called St. Ulric's earth, recommending it in the name of that saint, who they pretend drove all the rats out of the city and neighbourhood into a hole which they shew in his church. This dust is dug up from the place where he lies buried. But as this effect has never been ascertained by naturalists, it must go for nothing, especially as this highly extolled earth fails of its power over the rats in other places.

On the fine well-contrived aqueducts for the conveyance of water from the Lech, are several corn, sawing, flatting, and smelting mills. There are here also water-works which throw that useful element to the top of five towers, from which it is conveyed through the city in such a manner, that the greatest part of the houses are supplied with water. The palaces of the counts of Fugger are very magnificent; and the Fuggery, as it is called, consists of one hundred and six small houses erected in 1579, by the brothers Ulric, George, and James Fugger, in James's suburb, for the reception of poor burghers and inhabitants, to whom they are let at a very small rent.

Augsburg has always been famous for ingenious artists, particularly in clocks, goldsmiths work, and ivory turning. There are here shewn clocks valued at fifteen or twenty thousand crowns each; but the worst is, they are so very nice as not to be durable. Their ivory work is no less admirable, and among the rest contain well shaped cups with a ring made of the same piece, which plays between the foot and bowl of the cup without a possibility of coming off. These are so nicely made in miniature, that the learned Mr. Keyser says, they inclose one hundred of them with their rings in a pepper corn of an ordinary size. Upon examination, the traces of the tool with which they were turned are visible. They have other curious baubles, as fleas fastened about the neck with steel chains, so finely wrought, that though they are a span long, a flea will lift up the chain when it leaps, one of these fleas with this curious chain, they sell for ten-pence. The trade of this city is very considerable, though it is much inferior to what it was formerly.

This city is very remarkable for the singular variety of habits worn by the inhabitants; this affair being so exactly regulated by the magistrates, that the difference of the religion, and quality of the people, are for the most part seen by their cloaths. For instance, says Mr. Misson, I saw a Roman catholic merchant's widow in mourning for her husband: she had a handkerchief well whitened and starched with wings and cornets, a black petticoat, and a cloak of the same colour made like that of a man's, which reached down to her knees, a large white veil behind hanging at the corner of her handkerchief, and reaching down to her heels, enlarging itself by degrees, and a piece of the same linen with the handkerchief four feet long, and at least two broad, very much starched, and stretched on a square of wire, fastened just below the hips, and covering all the fore part of the body.

The garrison of Augsburg usually consists of three hundred men, and the burghers are computed at six thousand. One half of the council is Lutheran, and the other half Roman catholic. The magistracy at present consists of forty-five persons, thirty-one of whom are patricians, four of such as have married the daughters of patricians, five of the body of merchants, and five of the commonalty.

This city in the diet of the empire possesses the second place on the bench of the imperial cities of Swabia; but in that of the circle has the first seat and voice. In the year 1686, an alliance was concluded here between the emperor, Spain, Sweden, and some other princes and circles, in opposition to France; but towards the conclusion of the year 1703 and 1704, it suffered much by the Bavarians and French.

To the jurisdiction of this city belongs the village of Oberhausen; but in ecclesiastical matters it is subject to the bishop, who, conformably to an agreement made in 1602, grants institution to the ministers.

SECT. IV.

Of the Dutchy of WIRTEMBERG.

Its Situation, Extent, and Produce: The Number, Religion, and Manufactures of the Inhabitants. The Titles, Arms, and Prerogatives of the Duke. The Order of Hunters. The Revenues, Forces, and principal Towns and Palaces of Wirtemberg.

THE dutchy of Wirtemberg, or Wurtemberg, consists of a great number of towns and lordships, some of which were purchased, others devolved to the princes by marriage, and others were acquired by conquest. To the north it terminates on the bishopric of Spire, the Palatinate, the county of Hohenloe, and the district of the imperial city of Hall in Swabia; to the eastward it is bounded by the county of Limpurg, the districts of the imperial city of Ulm, the lordships of Rechberg and Wiesensteig, and the county of Oettingen; on the south-east by the Austrian dominions; on the south by those dominions, Brisgau, and other smaller districts; and on the westward it confines on Fursteinberg, the diocese of Strasburg, and the marquisate of Baden-Baden and Baden-Durlach, from which it is separated by the Black Forest. Its extent from north to south, exclusive of the most southern detached parts, is sixty-six miles, and it is of the same extent from east to west, without including the lordship of Heydenheim, which lies apart from it.

This is indisputably the most considerable and fertile part of the circle of Swabia, and is indeed one of the best countries in all Germany. This dutchy abounds so much in grain, that considerable quantities are exported; but this chiefly consists of spelt, rye and wheat being much less cultivated. Flax and hemp are also produced here, and the former thrive best in the coldest parts. The vallies formed by the skirts of the Alb, some of which are three or four hours in length, are covered as it were, with forests of fruit-trees, of which indeed there is no scarcity in most of the other parts of this country, cyder and perry being the liquors drank in common by the country people, when wine happens to be dear. This dutchy also abounds with very rich palatable and wholesome wine, called by the general name of Neckar, though each has a particular title of its own, which it receives from the part where the fruit grows. The grapes also that yield the best wines bear the name of the countries whence the wines were transplanted, as the Chiavenna, Valteline, and Hungarian. The vineyards of Wirtemberg have been much improved by the learned Mr. Bilfinger, who procured shoots from France, Italy, Hungary, Cyprus, and even Schiras in Persia, for his vineyard at Cantstadt, where most of them throve so well, that they have been transplanted from thence into many other vineyards.

The forests of this country are considerably decreased; for the consumption of oak in particular has been very large, and beech and birch now require to be used sparingly; but great quantities of turf are now dug, which makes up for the scarcity of wood for fuel. Great profits are made by grazing, particularly in the Black Forest. The largest breed of sheep is found on the Alb, and most parts of the country abound in game.

With respect to the minerals of this country, there are mines of silver and copper, and also some of iron; but the latter does not produce a sufficient quantity to supply the country. Sulphur is also met with in several places.

places, and many parts yield coal. *Terra sigillata*, reckoned preferable to that of Malta, and a fine clay for earthenware, are found here. In this country are also found fine variegated marble, some of which are equal to those of Italy, and remarkably transparent alabaster, agate, crystalline pebbles which cut glass, black amber, and fine mill stones.

Here are a considerable number of baths and mineral springs. The rivers which rise in this duchy are chiefly the following: the Neckar, which divides the duchy from north to south, and in the Lower Palatinate falls into the Rhine, being first increased by the Ens, the Fils, and Rems.

The number of inhabitants in this duchy is known with great certainty, an exact enquiry being made every year by the general superintendents, and reported to the annual synod. In the year 1754 were numbered four hundred and seventy-seven thousand one hundred and fifteen souls, and they have hitherto been observed to increase. In the duchy are also sixty-eight cities, with about twelve hundred boroughs, market-towns, villages, and hamlets.

The established religion of this country is Lutheranism; and though duke Alexander embraced the Roman, yet in 1729, 1732, and 1733, he gave assurances to the states, in formal instruments, that no innovation should be made in any part of the duchy, and that in all the churches and schools no other religion but that of Lutheranism should be taught; that no new Romish churches, chapels, altars, or images should be erected, nor any such as were forsaken again used; that no processions, pilgrimages, or catholic burying-places should be allowed; that the host should never be carried openly, nor any part of the catholic worship be performed, except only in the duke's chapel; but that the popish inhabitants of the town of Ludwigsburg should have the privilege of performing their service in private; that the privy-council should consist only of Lutherans; and that they alone should have the management of every thing relating to the church, the revenue, and the police.

The Calvinists are only tolerated here, and their place of worship at Stutgard is a private house. In this duchy are also some Waldenses, who are husbandmen, and live in the Italian villages, as they are called; only in a few towns they have established manufactures of hats and stockings, and are allowed the public exercise of their religion.

In the whole duchy are five hundred and fifty-five parishes, and about fifty deaconries, besides eight hundred and twenty-nine chapels of ease. The parishes are divided into thirty-eight special superintendencies, and those into four general ones. The special superintendents hold, together with their deanries, the parishes of the towns where they reside, annually visit the churches and schools within their department, once or twice a year convene the ministers subordinate to them, and make their report to the consistory.

This country has several considerable manufactures, as those of porcelain, potters-ware, the casting of plate-glass for looking-glasses, damask, and other linen and woollen stuffs; the printing of cotton, manufactures of silk, the making of hats and stockings, gilt and marble paper, &c.

The titles of the duke are, duke of Wurtemberg and Teck, count of Mompelgard, lord of Heydenheim and Justingen.

The arms for Wurtemberg are, three stags horns sable, in a field or: for Teck or, and sable lozenges: for Mompelgard, two barbels endorsed with tails averted, in a field gules: for Heydenheim, a Saracen's head, with a kind of hussar's cap gules, in a field or: for Justingen, azure, a staff in bend with branches on both sides; and lastly, the imperial standard borne by the ducal house of Wurtemberg, as hereditary standard-bearer of the empire.

The dukes are likewise grand-huntsmen of the empire; and, in allusion to this, duke Eberhard Lewis, in the year 1702, founded the order of hunters, and in 1719 renewed and increased its statutes, the reigning duke being always grand-master. The ensign of the order is a gold cross resembling that of Malta, enamelled with red,

and at each of the four corners a golden eagle, with a hunting-horn between the middle and lower point of each part. In the center is a small shield, on one side of which is a W in relievo, with a ducal hat over it; and in the other three golden hunting-horns. This cross is worn appendent to a broad watered scarlet ribbon, passing from the left shoulder to the right side. On the left breast of the coat is a silver star embroidered with the ensign of the order in the middle, and in a green circle round it *AMICITIÆ VIRTUTISQUE FOEDUS*. The grand festival of this order is on St. Hubert's day, which is also celebrated with a great hunting-match at the place where the grand-master happens to reside.

The duke of Wirtemberg, in virtue of this duchy, sits and votes in the college of princes, and is the summoning prince and director of the circle. Mr. Keyssler, in his travels, computes the whole revenue of this country at two millions of guilders per annum. The country itself levies the contributions and excise.

The duke's court is one of the most numerous in Germany, his liveries rich, his stables furnished with the finest horses, and his hunting equipages magnificent. He has a grand-marshal, cup-bearer, master of the horse, gentlemen of the bed-chamber, and twenty pages, all men of good families, many footmen, &c. He keeps in pay a body of horse-guards, horse-grenadiers, dragoons, and foot-guards, besides five regiments of foot, and a body of artillery.

The duke has several hunting-seats, which he visits alternately in the deer and boar seasons, so that every five years he sees his principal forests. It is an old custom all over the country of Wirtemberg, to adorn the chambers and galleries with the largest and most branching horns; so that it is natural to imagine, that the hunting-seats are still more plentifully supplied with these decorations. At Waldenburg, the name of the person who shot the deer is inscribed over most of the remarkable branches; and the walls of several rooms are filled with these marks of the duke's dexterity.

At Stutgard are the privy-chancery, in which the duke himself presides; the privy or ministerial council, consisting of nobles, men of letters, and officers; the college of government, which has a president, and among its members are also nobles and men of letters; the consistory, which has a president, director, and counsellors; the board of war, which has a president and other members; the treasury has a president, a receiver, a solicitor, and other officers; the ecclesiastical college has a director, administrators of the church revenues, and other members and officers; with several other boards, as those of the mint, trade, forests, domains, mines, &c.

In the high court of justice causes are terminated in the last resort, no appeal being allowed to the aulic or any other tribunal: this court was in 1514 removed for ever to Tubingen, where it holds its sessions once a year; and consists of a chief justice, assessors, who are composed of nobles, men of study, and country gentlemen, as also of a secretary. Mr. Keyssler says, that this court of judicature is a jewel equal to that of appeal among the other electors. A very considerable benefit arising from it, is the speedy administration of justice, the pleadings being verbal, and a sentence given every day. It is remarkable that the president, or chief justice, has during the sessions only three guilders *per diem*; the assistants, who are noble, two; and others, who do not live at Tubingen, one dollar; and such as are inhabitants a guilder, and a rundlet of wine presented to each assistant at the end of the session, which seldom lasts above six weeks.

It is remarkable that in all the cities, towns, and villages in this duchy, there are certain officers called private overseers, who inspect into the offences, clandestine meetings, and other misdemeanors of their fellow-citizens, and make their report to the magistracy of the place, that these matters may be farther inquired into. These private inquisitors, who take an oath to discharge their office with fidelity, receive no salary; but are generally rewarded with a counsellor's place, or some other office in the government. As nobody knows his accuser, this office may be attended with the most dreadful abuses, if these informations are considered as any thing more

than premonitions with respect to the judge, or as an incentive to more regularity and caution. This is pretty much of a piece with the secret informations of Venice; and I question, says Mr. Keysser, whether the like is to be met with in all Germany.

The principal places in this dutchy are Stutgard, Ludwigsburg, and Tubingen.

Stutgard, the capital of the dutchy, lies in a delightful country full of gardens and vineyards, on the bank of the Nisenbach, in the forty-eighth degree forty-seven minutes north latitude, and in the ninth degree eight minutes east longitude. The city is not large, but contains two well built suburbs. The new ducal palace was begun in the year 1746. Near the old palace stands the chancery, which is a handsome structure built of stone, and on the other side of the palace towards the east are the menagerie and pleasure-house, the latter of which is admired for its curious architecture. It was erected in the year 1584 wholly of stone, and contains two stories, in each of which is a saloon. The hall has few equals in Europe; it is two hundred and twenty feet in length, eighty broad, and ninety high, without a single pillar; its roof, which is arched, being fastened in a masterly manner with wooden screws. In 1707 marshal Villars, the French general, entering this hall mistook it, and said with some admiration, *Voici un beau temple*; that is, "This is a fine church." On the roof are painted several scripture histories; but the sides are covered with views of all the forests of the dutchy of Wirtemberg, and some merry adventures that happened in the chace.

Near it is the orangery, which is composed of large and very high trees, but is not well contrived; for the want of height occasions many of the trees to bend at the top; and the grottos near it are not the most beautiful. The new building, as it is termed, is of fine free-stone, with a grand stair-case of the same, and a spacious hall, whose gallery rests on twelve lofty pillars, on which are painted the twelve months. The roof shews the most antient transactions of the family of Wirtemberg, and the sides are filled with masquerades and public entries, and a large painting of the battle of Hochstet. The uppermost chambers serve for armouries, and besides old and new armour contain some stuffed horses, that were particular favourites of the duke's, with stags, wild boars, and hounds. In the lower part are the duke's stables.

In the museum are several portraits of the ducal family, with petrifications, mechanical and mathematical instruments, curious pieces of penmanship and turnery, gems, costly vessels, mummies, and antient medals. Among other curiosities you see the picture of a woman with a large beard, as she appeared in 1587, when she was in her twenty-fifth year; her name was Barteld Gratje; and she is again painted as she looked in her old age.

In the dutchy-house both the committees of the country and the secular diets assemble. The see of the bishop, which was antiently at Beutelspach, was removed to this place in 1321, on which account the church of the Holy Cross is stiled the cathedral. Among the German Lutheran churches are the hospital church and St. Leonard's. The French Lutheran congregation have their public worship in the palace-church belonging to the convent of Bebenhausen, and the French reformed meet in a room of the old palace. In this town is also a special superintendency, and a *gymnasium illustre* of seven classes. The silk manufactories of Stutgard make all sorts of silk stuffs, stockings, and ribbons.

Ludwigsburg, a palace two leagues from Stutgard, is one of the finest palaces in Germany. The looking-glass and lackered closet are well worth seeing, as also the large stair-case for ambassadors, with its grand ceiling and the gallery of pictures. Among these are some admirable night-pieces, and many pictures of horses and dogs. The chapel belonging to the palace is very elegant, but rather too small. Opposite the lower part of the palace, on an eminence in the pheasant-garden, stands the Favorita, a most beautiful building in the newest Italian taste. Here is also a curious menagerie of foreign fowls; and the green-house is a very fine one.

Ludwigsburg is reckoned the second ducal seat, and third principal town. Towards the beginning of the

present century, there were here no more than two farm-houses; but Eberhard Lewis having built the palace, houses have been gradually raised near it, so as at length to form a handsome town, that lies higher than the palace, and is the seat of a general superintendency. Here are made linen damask, good cloth, and marble paper.

The city of Tubingen, which is situated on a mountain, consists of about five thousand inhabitants, and is famous for its university. The Ammer, Neckar, and Lustenauer vallies give this place such an agreeable situation, and beautiful prospects, as few cities in Germany can boast. The castle is now only considered as a hunting-seat, to which the duke usually comes with his court once in five years. It has good apartments, and in former times must have been reckoned very strong; for besides the steep declivity of the mountain, it is surrounded by a deep trench. It is every where vaulted underneath, and among other cellars is one that has not perhaps its equal. It is in a rock, and lined with free-stone, though it is three hundred feet in length, and twenty in height. The thickness of the arch of the cellar is twenty-two feet. This vault communicates with another, in which is a large well of fine clear water walled in, and three hundred fathoms deep. The undulating sound caused by dropping a stone, or firing a pistol down the mouth, has something amazing and dreadful.

Tubingen is esteemed the second town of the dutchy, and besides its university, has a *collegium illustre*, all the scholars of which are princes or counts; and it is never opened, but when youths of such families come to study there. Here is also a Latin school of four classes, and a special superintendency. In this town is a woollen manufacture.

Urach, a town in a district of the same name, is chiefly remarkable for there being near it on a high and steep mountain, a very extraordinary machine called the Wood-slider; it consists of a thick iron pipe about three feet broad, upwards of two feet high, and nine hundred feet long, through which the wood hewn in the forest beyond Urach, which abounds both in beech and fuel, after being cut into logs or billets, is carried down from the eminence with prodigious celerity, and thrown into the Erms, which forwards it into the Neckar, whence it floats to Berg near Stutgard, where it is at last stopped, and piled up in the duke's wood-yards. In this manner every year about Easter, upwards of nine thousand cords of wood are brought from the Alb to Stutgard, besides what is used in the duke's court. The produce of what is sold is applied to the payment of the ecclesiastical and civil officers.

SECT. V.

The Margravate of BADEN.

Its Situation and Divisions, with the Titles and Arms of the Margraves of Baden-Baden; its Situation, with a Description of Rastadt, and the Palace named Favorita. Of Baden-Durlach, the Palace of Carlsruhe, and the Town of Durlach.

THE margravate of Baden, or Baaden, is seated on the eastern side of the Rhine; it is properly the tract of land between the rivers Pfinz and Schwartzbach, and is watered by the little rivers Alb, Pfedderbach, Murg, Saubach, and Sultzbach, all which discharge themselves into the Rhine. The northern part of this country is called the Lower Margravate, or from Durlach its capital, the margravate of Baden-Durlach; but all the rest is termed the Upper Margravate, or from Baden its capital, the margravate of Baden-Baden. But to these margraves also belong other lands. The whole margravate is a fertile country, abounding with corn, hemp, flax, bees-wax, and wood.

The margraves of both titles descend from the same stock, and the titles of each of them are, Margrave of Baden and Hochberg, landgrave of Saufenberg, count Sponheim and Eberstein, lord of Roteln, Baden, Weiler, Lahr, and Mahlberg; but the house of Baden-Baden adds the districts of Ortenau and Kehl.

The arms for the margravate of Baden are Party per bend gules, in a field or: for Sanzenberg, a lion rampant gules, crowned or, in a field argent: for Sponheim, chequée gules and argent, azure and or: for Eberstein, a boar sable on a mount verte, in a field or, and a rose gules, with seeds azure, in a field argent: for the landgravate of Brisgau, a crowned lion gules, in a field argent: for Roteln, a lion passant gules, in a field gules, and two fesses waved argent, in a field azure: for Baden-Weiler, gules party per pale or, with three chevrons sable: for Lahr, argent per fesse gules: for Mahlberg, a crowned lion sable, in a field or.

We shall first treat of the margravate of Baden-Baden, which terminates to the westward on the Rhine, and a small part of it lies on the west side of that river; on the north-west it is bounded by the lower margravate of Baden-Durlach; on the eastward by the duchy of Wurtemberg, and the county of Eberstein; on the southward by a part of the bishopric of Strasburg, and the principality of Hesse-Darmstadt. The lordship of Mahlberg, which also belongs to this family, lies somewhat higher up the Rhine.

Baden-Baden has a vote in the college of princes, and among the temporal princes in the circle of Swabia. The margraves of Baden-Baden, and Baden-Durlach, are also the chiefs of the second quarter of the circle of Swabia. The principal colleges and offices of this prince are the privy council, the court of justice and treasury. His annual revenue, according to Keysser, is four hundred thousand florins.

The principal places belonging to the Upper margravate are the following:

Rastadt, a city regularly built, with a stately palace, or castle, the center of which affords a view of the streets. This palace was formerly adorned with a great number of fine paintings; but they were considerably diminished by father Meyer, who had such influence over the counsellors dowager, as to cause pictures to the value of fifty thousand guilders, which he judged too naked and libidinous, to be committed to the flames. This city is situated in a fine plain near the river Murg, which, a little below it, falls into the Rhine. It was built by the margrave Lewis William with regularity and elegance, and in the year 1714 a peace was concluded here between the emperor and France.

The Favorita is a beautiful seat at some distance from Rastadt, built by the widow of the margrave Lewis William. It has a chamber of very beautiful porcelain, and a cabinet lined with looking-glass, with many curiosities of art and nature, particularly above forty pictures in which that princess appears in the different masquerade habits she formerly wore. Amidst the gradual alteration of the complexion and features, in such a long succession of time, the same look is every where observable; and Mr. Keysser observes, that these fine portraits may be compared to the admirable performances of Rubens in the Luxemburg gallery, where queen Mary de Medicis is represented under a variety of changes. The hall reaches in height through all the stories, and its cupola, round which is a balustrade leading to all the several floors, is very lightsome, and adorned with beautiful paintings. Some of the other rooms are hung with a Chinese manufacture of paper and silk: another with lace-work; the ceiling of another is enriched with gems, as agate, jasper, cornelians, amethysts, &c. imitating fishes, birds, and flowers. There is also a magnificent table of the same workmanship. The excellent order of the kitchen, larder, hall, and medicinal-room, cannot fail of pleasing an œconomist; and accordingly that princess took no little pleasure in walking with her guests through these subterranean apartments.

On the left, at the end of a little orangery, is a pheasant-garden, and on the right a wild thicket leading to an hermitage which stands in the centre of it. The outer walls are covered with large pieces of bark. The door seems to rest on the trunks of old trees, and all that is to be seen on the inside are the coarse images of Jesus, Joseph, and Mary; the niches, like the doors, are supported by old trunks of trees. There is a mean bed without curtains; an altar without decorations; and at

the angles at the narrow walks in the garden stand wooden images of the old hermits as large as the life, some of them in hairy habits. In short, this hermitage owes its agreeableness to an exact imitation of the natural simplicity of a solitude adapted to devout contemplation.

The Lower margravate of Baden terminates to the west on the river Rhine, to the southward on the Upper margravate of Baden and the dukedom of Wurtemberg, to the eastward on the same dukedom, and to the northward on the bishopric of Spire.

The margravate of Baden-Durlach enjoys two votes in the college of princes, one for the Lower margravate of Baden, and the other for the margravate of Hochberg in the Brisgau. These countries likewise entitle him to two votes in the diet of the circle of Swabia, where he has a seat among the princes.

The great colleges here hold their sessions at Carlsruhe; these are the privy-council, the treasury, the chamber of accounts, the court of justice, the ecclesiastical-council, and the matrimonial-court.

The reigning family, and the country in general, profess Lutheranism; but the Calvinists, Papists, and Jews, are tolerated at Carlsruhe, and several other places. The whole country of Baden-Durlach contains a hundred and twenty parishes, which are under the inspection of seven superintendents.

The revenues of the prince are computed at four hundred thousand florins.

The city of Carlsruhe, or Charles's Rest, is seated in a district of the same name, that is one continued plain, every where sandy, yet produces corn, hemp, flax, turnips, peas, and other vegetables; and the villages along the Rhine abound in hay, and breed great numbers of cattle. The city receives its name from Charles William, who built it; and on the seventeenth of June, 1715, laid the foundation-stone of the palace there, on which occasion he instituted the order of Fidelity. This city has a *gymnasium illustre*, in which are eight masters, the four first of whom are styled professors. The Lutherans have several churches, the Calvinists and Catholics have also theirs, and the Jews a synagogue. The town is very regularly built, but both the houses and the palace are only of wood and brick; those houses that are near the palace are the largest, and have a range of piazzas.

The first object of attention in building of the palace, and for which no expence was thought too great, is the turret on the body of the building, from whence one has not only a view into all the main streets, which are divided by three cross streets; but also into twenty-five vistas, some set with trees, and others cut through the woods; and the beauty of the prospect is still heightened by other variegated walks in the same woods. Some of these walks bear the names of the ministers who served his highness at the time when these improvements were made, and most of the streets in the town are called after princes.

The garden, though small, is very elegant, it having no less than four thousand orange, lemon, bay, and other such trees; among which, says Mr. Keysser, two thousand seven hundred are orange-trees. In some of the lower parts of the garden are pretty espaliers of young lemon-trees; and behind the palace is a decoy, where about two thousand wild-ducks are daily fed. The chief defect in Carlsruhe is the want of water, and what the garden has is conveyed thither by hand-pumps.

In the upper district of Durlach, which is a very fruitful country that produces not only plenty of corn, hemp, and flax, but good wine, is Durlach, the capital of the margravate, and once the residence of the prince. It is seated on the river Pfingz, in the forty-ninth degree twenty minutes north latitude, and in the eighth degree twenty minutes east longitude. It had formerly a palace called Carlsburg, with a special superintendency, and a grammar school; but in 1689 was laid in ashes by the French. At a small distance from the town is a very large decoy for wild-fowl; and in this district is Seehof, the mansion-house of a fine estate belonging to the prince, near which are most beautiful meadows for the use of his stables.

S E C T. VI.

A concise Account of the free imperial Cities of Swabia.

WE have already given a description of Augsbuꝛg in treating of that bishopric, and shall therefore begin with the city of Ulm, which is seated on an uneven spot of ground on the Danube, over which it has a stone bridge, in the forty-eighth degree twenty-three minutes north latitude, and in the tenth degree six minutes east longitude. Here that river receives into it the Blau, which runs through a part of the city, and just beyond it is joined by the Iler. This city is pretty well fortified, but strangers are never suffered to go upon the ramparts without paying a guilder; the very burghers are under the same restraint: this being the privilege of the patricians and their friends, which solely proceeds from avarice; for these patricians share the hay and fruits that grow upon the ramparts among themselves, which makes them thus strictly cautious to prevent any diminution of their profit.

The inhabitants are mostly Lutherans, and to them belongs the cathedral, which is a large structure, that stands almost in the center of the city, and has seven ministers. The building is three hundred and sixty-five feet in length; and the windows, particularly six in the choir, are most beautifully painted, and one of them is said to have cost three thousand German florins. The steeple of this cathedral is four hundred and one steps high, and affords a most extensive prospect, all the adjacent country being level. The Lutherans have also the church of the Holy Ghost, that of the Bare-footed friars, and an hospital. The Roman catholic inhabitants perform their public worship at the convent of St. Michael at Wengen, in which are regular canons of the order of St. Augustine, and in the house of the Teutonic order. The Lutheran seminary is founded in a convent that formerly belonged to the Bare-footed friars. Among the other structures is the splendid foundation of Samlungstift, which is particularly appropriated for the daughters of patricians; and among the public civil buildings are the town-house and the arsenal.

The houses are for the most part of timber and plaister; they make but an indifferent appearance, and the streets are neither wide nor handsome; they have several squares, but they are mean and very irregular. It is reckoned near six miles and a half in circumference: its ditches, which are well fortified, are almost every where double, and on one side of the town the Danube runs through them with great rapidity, while the others are kept full of water by sluices. This city was once so rich, that it passed for one of the wealthiest in the empire; and the Germans were accustomed to say, "The ready cash of Ulm, the neatness of Augsbuꝛg, the industry of Nuremberg, and the arsenal of Strasburg, were the four wonders of Germany."

The magistracy here is Lutheran, and consists of forty-one members, above half of whom are patricians. This city maintains six companies of soldiers. Large quantities of wine are brought hither from the Rhine, the Neckar, the lake of Constance, and the Veltlin, and carried up the Danube. It also trades in linen and other goods. This city possesses the fourth seat on the bench of Swabian cities in the diet of the empire; but in the circle of Swabia has not only the second place on the Swabian bench, but the perpetual *directorium*. Here are kept the archives of the imperial towns in Swabia and Franconia, and the diet of Swabia is also usually held here.

The free imperial city of Esslingen is seated on the Neckar, eight miles to the east of Stutgard. What is properly called the city stands on a branch of that river, and contains St. Denis's church, together with the New or Dominican church, the *Frauenkirchen*, and another which belonged to the Bare-footed friars, the orphan-house, the grammar school, and the *collegium alumnorum*; as also the fine town-house, and the rich hospital of St. Catharine. It has three suburbs, namely, the Upper suburb, which, as well as the city, stands on a branch of

the Neckar; the suburb of Beuten, near which is the citadel; and the suburb of Bliensau, which is situated on an island between the main stream of the Neckar and the above-mentioned branch, and is famous for containing in it the arsenal of the circle of Swabia.

The principal church belongs to the Lutherans, who compose the magistracy; and the Roman catholics perform their public worship in the chapel of the stewards of the convent of Cayfersheim. In the diet of the empire this city possesses the fifth place on the bench of the imperial cities of Swabia; but the third on the bench of cities in the circle of Swabia. Esslingen is under the protection of the duke of Wirtemberg, by whose territories this city and the country belonging to it are surrounded. This city, in the year 1701, suffered greatly by fire.

The free imperial city of Reutlingen stands about five miles distant from Tubingen, on the little river Echetz, which runs into the Neckar. This city is small, and has only one parish-church, an hospital, an orphan-house, and a grammar-school. Both magistrates and burghers are Lutherans, and the former usually consist of twenty-eight persons, of whom the civil judge and twelve others are commoners. In the diet of the empire it is possessed of the sixth seat and vote on the bench of the imperial towns of Swabia; but in that of the circle, of the fourth on the bench of towns. It is also under the protection of the duke of Wirtemberg.

The imperial and free city of Nordlingen is seated in a pleasant fertile country on the river Eger, and till the year 1238 stood on the adjacent hills of Emeransberg; but being then consumed by fire, was built on the spot where it now stands. Almost all the burghers are Lutherans, who have three churches, and a Latin school; but the Roman catholics have their church near the German house. The magistracy are also Lutherans. This city likewise possesses a seat on the bench of the imperial towns of Swabia, and in the diet of the circle.

In the year 1647 it was besieged by the army of the empire for seventeen weeks, during which it suffered greatly by an accidental fire; and in 1702, a famous compact was entered into here between the five circles; after which this town was better fortified, as being a bulwark to the circle of Franconia against Bavaria.

We shall now describe the free imperial city of Hall, otherwise called Swabian-Hall, which, together with its territories, is seated on the river Kocher, between the counties of Hohenlohe and Limburg, the margravate of Anspach, and the dutchy of Wirtemberg. It is so surrounded by mountains, that it is not easy to approach it; and is divided from the suburbs by the river, over which is a stone bridge. The town consists of three parts, namely, of Old Hall, in which stands the principal church of St. Michael, with the college, the hospital, another church, and the salt-houses; of the part above the Kocher, in which stands the house of the order of St. John, and St. Catharine's church; and the third part is composed of Gelbinger-street. The city is Lutheran, and the magistracy consists of twenty-four persons, under the direction of two burgomasters, as presidents. The city owes its origin to its salt-springs, which are said to have given occasion to several noblemen to settle there, and among other buildings to erect seven towers of stone; whence the place at first obtained the name of Siebenburgen, or Seven-castles, and afterwards it became gradually enlarged, till it arrived at its present state. This city also possesses a seat in the diet of the empire, and in the circle of Swabia. It has several times suffered greatly by fire, particularly in the year 1728.

The imperial town of Uberlingen is seated on a rock, in a bay of the lake of Constance, and its moats are formed of so many stone quarries. The town is divided into three parts, the Upper Town, the Lower Town, and the Gallenberg. The inhabitants are of the Romish religion, and have a collegiate church dedicated to St. Nicholas, a house of the order of St. John, an imperial hospital, three convents, and two other churches. Near the town is a good mineral spring. Uberlingen possesses a place in the diet of the empire among the imperial towns of Swabia, and among those of the circle.

The

The free imperial town of Rothweil is seated on an eminence by the Neckar, and its territories border on those of the dutchy of Wirtemberg. The inhabitants are of the popish religion, and there are here a monastery of the order of St. John, a college of Jesuits, and three convents. It enjoys the same privileges as the other cities, in having a representative at the imperial diet, and in that of the circle.

Heilbron, a free and imperial city, is seated on the Neckar, in a very pleasant and fruitful wine-country on the borders of the dutchy of Wirtemberg and the Palatinate. It received its name from Heilbron, which signifies Health-spring, from a spring that, by means of several conduits, supplies the city with excellent water in seven different places. It is not used medicinally, as it was formerly, but continues in great repute for its extraordinary clearness and salubrity. To the use of this spring the emperor Charles V. attributed his recovery from a dangerous fit of sickness. This event is commemorated by the following inscription in High Dutch, which Mr. Keyser observes is to be seen on a house belonging to the prelates of Sconthal, but at present inhabited by the post-master: "On the twenty-fourth of December, 1546, the emperor Charles V. was brought hither in a litter; and on the eighteenth of January, 1547, he rode from hence in perfect health on horseback." On each side of this monument stand Fortitude and Clemency, with four other virtues, and two crowned pillars, with the inscription PLUS ULTRA. In this house is also to be seen a portrait of Charles V. which he left behind him when he went away. It is well executed, and resembles all the portraits of that emperor done by Holbein. Our author mentions there being one year such plenty of wine in this country, that the inhabitants had not a sufficient number of casks to put it in, and that wine of the growth of the year 1725 was sold for half a creutzer, or about a farthing a quart.

The city of Heilbron is well built, and has three parish-churches, the principal of which is dedicated to St. Kilian. The college and town-library are in a convent that formerly belonged to the Minorites. There is here also a mansion-house, and commandery of the Teutonic order, with a nunnery of the order of St. Clare. The form of government is aristocratical, and the magistrates, as well as most of the inhabitants, are Lutherans. Heilbron was for a considerable time under the protection of Wirtemberg, and afterwards under that of the elector Palatine. It possesses a seat in the diet of the empire among the imperial towns of Swabia, and in the bench of those on the circle.

Gmund, or Gemund, another free and imperial town, is seated on the Rems, on the borders of Wirtemberg. The inhabitants are of the Romish religion, and have five churches, the principal of which is that of the Holy Cross. There are here also four monasteries and two nunneries. The magistrates are elected out of the body of the people. This city enjoys the same privileges as the rest, with respect to the imperial diets, and those of the circle.

The free imperial town of Memmingen is seated in a beautiful and fertile plain on a small river called the Aach, which runs into the Iler. This town is Lutheran, and its principal church of St. Martin belongs entirely to those of that communion; but the church of Our Lady is possessed in common by them and the Roman catholics. There is here also an Augustine monastery, with a church, a Franciscan nunnery, a monastery belonging to the monks of the Holy Cross, with an hospital near it, in which is a church, a chapel dedicated to the wise-men of the East, a small church, and another hospital near the church of Our Lady. The magistrates are of the Lutheran religion, and consist of nineteen persons, part of whom are patricians, and part chosen from the body of the people. This city has also a representative at the imperial diet, and in that of the circle. The inhabitants carry on a good trade with Swisserland, Italy, and the other neighbouring countries in Bavarian salt, home-spun linen, corn, hops, and other goods.

Lindaw, or Lindau, is an imperial city situated on an island in the lake of Constance; but has a communication

with the continent by means of a very large wooden bridge; and is divided by an arm of the lake, so as to form another smaller island that is separated from the city, and consists of vineyards and gardens, and is walled quite round. Hence, on account of its situation, it has been stiled the Venice of Swabia. The parish-church is dedicated to St. Stephen: it has also a well endowed hospital, and a grammar-school, consisting of four classes. The castle, and the heathen-wall, as it is called, stand near the gate at the bridge which leads to the continent, and are supposed to be Roman works; the latter of which is attributed to Tiberius Nero, and the former to Constantinus Chlorus, at the time of their encampment in this island, during their expeditions against the Vindelici and Alemanni. It is also supposed that near this castle formerly stood a town, and that the little church of St. Peter was built on the first introduction of Christianity into this country.

There is here an imperial abbey, the abbess of which is a princess, who holds the first seat in the imperial diet among the abbesses on the Swabian bench of prelates, and has also a seat in the secular bench of princes in the diet of the circle. It is remarkable that every abbess, on her accession to her government of the abbey, has the privilege of releasing the first malefactor capitally condemned within the jurisdiction of the city.

The magistracy consist of the privy and large-council. The city had formerly a provincial tribunal, but ever since the end of the fifteenth century this has been annexed to Altorf, and Lindaw annually pays two tons of wine, as an acknowledgment to the prefecture of Altorf. This city has a place among the imperial cities on the Swabian bench of the diet of the empire, and in that of the circle of Swabia. At the diet held here in 1496, was established the chamber of justice. In 1647, it held out a siege of nine weeks against the Swedes, who were at last obliged to retire; and, in 1728, a considerable part of the city was consumed by fire.

The imperial town of Dinkelsbühl is seated on the Wernitz, near the margravate of Anspach, and stands on three hills, on which formerly grew spelt, whence its arms are an ear of spelt or. The inhabitants are a mixture of Lutherans and Roman catholics, the latter of whom are possessed of the great church, and two convents; but the former of the hospital church, their own consistory, and two German schools. The magistracy here is one half Lutheran and the other Roman catholic. This city enjoys the same privileges with the rest with respect to the diets of the empire and the circle.

Biberac, another imperial city, is seated on the little river Reis, or Rufs, in a pleasant fruitful valley, surrounded with hills, fields, gardens, and meadows. Its name signifies the residence of bevers, and it is thus called from the number of those animals near it; hence its arms are azure, a bever crowned or. Half of the magistrates are Lutherans, and half Roman catholic. St. Martin's, or the great church, and the rich hospital, with its church, are common to both sects. The Lutherans are also possessed of the church of St. Mary Magdalen, and each of them have a grammar-school. Its deputy has a seat in the diet of the empire, and also in that of the circle. There are here many weavers, and its principal trade consists in fustians.

The imperial city of Ravensburg is seated in a valley on the Schufs, a small river that falls into the lake of Constance. It has four gates, many convents, a handsome town-house, and the churches are well built. In the middle of the town is a high watch-tower, in the place of one blown down by a whirlwind in 1552, on which is an inscription, that the watchman, or trumpeter, who, according to custom, sounds the hour of the night, fell down from the top with the tower, without receiving the least hurt, while his wife and son, who were below, were killed. The Lutherans and Catholics are on the same footing with each other, both with respect to spiritual and temporal affairs, and the magistracy is shared between them. The church situated near the Carmelite convent is common to both sects; but the Trinity church is in the possession of the Lutherans alone, and the Roman catholics have two parish-churches.

It has also a seat in the general diet, among the imperial cities on the bench of Swabia, and on the bench of the circle.

Kempten, an antient imperial city, is seated on the Iller, which flows between the town and the suburbs. Both the burghers and magistrates are of the Lutheran religion, and have a handsome parish-church, and a grammar-school.

In this city is a very antient Benedictine abbey, which Hildegard, consort to Charlemagne, repaired in the year 775, and if she was not the original foundress, she settled on it her share of her mother's inheritance, in acknowledgment of which the abbey took her image for its coat of arms. The prince and abbot of Kempten is grand-marshal to the empress, and at her coronation takes from her the sceptre, which he afterwards delivers back. He has a seat in the imperial college of princes, and in the diet of the circle of Swabia; as the city of Kempten has among the cities on the bench of Swabia, and in that of the circle. In the year 1633 this city was taken sword in hand by the Imperialists, with the slaughter of at least two-thirds of the burghers.

The imperial city of Kautbeuren is situated in a valley on the banks of the Wertach. The burghers are partly Lutherans and partly Roman catholics; but its magistracy consists of eight Lutherans, and only four of the Romish religion. In the town court and great council all the members are Lutherans, except two Roman catholics. Here are a college of Jesuits, and a Franciscan nunnery. This town has likewise a seat among the imperial towns on the bench of Swabia in the general diet, and in the diet of the circle.

Weil, also called Weilerstadt, in Latin Wila, is an imperial town seated on the river Wurm, and surrounded by the dutchy of Wirtemberg. The Popish religion prevails here. The parish-church of St. Peter was formerly collegiate. Here is also a convent of Augustine and Capuchin monks, together with a rich hospital. This city enjoys the same privileges as the rest with respect to the diets. In the year 1388 count Ulric of Wirtemberg lost his life in a battle near this city, and in 1648 it was taken by storm by the French.

Wangen, together with its district, is seated on the river Argen, and is but a small place, notwithstanding its having the same privileges with respect to the diets. The inhabitants are Papists, and have here a parish-church, an hospital, and a convent of Capuchins.

Isny, another imperial town, is seated on the river of the same name in the Algau. Its magistrates, and the greatest part of the burghers, are of the Lutheran religion; but among the latter are some Roman catholics. Here is an abbey of Benedictine monks. It has a place in the diet of the empire, and in the circle of Swabia among the other imperial towns. In 1721 it suffered extremely by fire.

The antient imperial town of Leutkirch is seated on the river Eschach, which a little below this place runs into the Aitrach. It has a Lutheran and Roman catholic church, together with a nunnery of Franciscans; but the greatest part of the magistracy are Lutherans.

The antient and imperial town of Wimpfen, in Latin Wimpina, was in the time of the Romans called Cornelia. It is seated on the river Neckar, and properly consists of two towns, the most considerable of which is called Wimpfen on the hill, and the other Wimpfen on the vale. In the former is a Lutheran parish-church, a grammar-school, and a popish hospital, or foundation of the order of the Holy Ghost: in the latter is a popish abbey dedicated to St. Peter, and a convent of Dominican monks. The magistracy are, however, composed entirely of Lutherans. In 1726 a sharp action happened here between count Tilly and the margrave of Baden-Durlach. In 1645 and 1688 Wimpfen was taken by the French.

Giengen is seated on the river Brenz, and is entirely surrounded by the dutchy of Wirtemberg. The inhabitants are of the Lutheran religion, and enjoy the same privilege of sending a deputy to the general diet of the imperial towns of Swabia, and in that of the circle, as all the other imperial towns. In 1634 this place was entirely destroyed by the Imperialists.

The little free imperial towns of Pfullendorf, Buchorn, Alen, Bopfingen, Buchau, Offenburg, Gengenbach, Zell, and Hammersbach, are scarce worthy of any description, since they are inconsiderable places, and are only distinguished by their having a seat in the diet of the empire, among the imperial towns on the bench of Swabia, and in that of the circle.

S E C T. VII.

Of the small Principalities of Hohenzollern and Furstenberg, the Counties of Oettingen, and Eberstein, with the Lordship of Mindelheim.

THE principality of Hohenzollern is a fruitful country advantageously situated in a narrow tract near the Danube, between Furstenberg and the dutchy of Wirtemberg. It took its name from the castle of Zollern, which stands by a river of the same name, and is a long and narrow tract extending about thirty-four miles in length, and about ten where broadest; but in other places scarce five. It is tolerably fertile, and is governed by its own princes.

The family is divided into the two branches of Hechingen and Sigmaringen: each reigning prince has a council and treasury; but the former alone has a vote in the college of princes, though both have a voice in the diet of the circle.

The titles of the reigning princes are, Prince of Hohenzollern, burgrave of Nuremberg, count of Sigmaringen and Voringen, lord of Haigerloch and Wohrstein, and hereditary chamberlain of the Holy Roman empire; yet the annual revenue of the prince of Hohenzollern-Hechingen is computed to amount to no more than thirty thousand florins, and that of Hohenzollern-Sigmaringen does not exceed this sum.

The former of these princes resides at Hechingen, which is seated on the river Starzel, and has an abbey dedicated to St. James. The residence of the latter is at Sigmaringen, a town seated on the Danube.

The principality of Furstenberg is a narrow tract, which, according to some authors, extends about seventy miles in length on both sides the Danube, which has its source within its limits; but no where exceeds eighteen miles in breadth; but this account does not seem to be very accurate, and Dr. Busching, who is extremely explicit in some particulars, takes no notice of its form and extent. The county of Heiligenberg, which composes a considerable part of this principality, is bounded on the east by Konigssee and Ravensburg, on the east it terminates on the territory of Constance, to the west it borders on the jurisdiction of Uberling and Petershausen, and to the north on the imperial town of Pfullendorf and Hohenzollern.

The prince of Furstenberg is entitled to six votes in the diet of the circle, two among the princes for Heiligenberg and Stuhlingen, and four among the counts and barons, as lord of Moskirch, Baar, Hansen, and Gundelfingen. In the imperial diet he possesses only one vote in the college of princes, and another vote in the college of the counts of Swabia, for Heiligenberg and Werdnberg.

There are no places in this principality worthy of a particular description, there being only a few small towns and villages.

The county of Oettingen lies to the east of the dutchy of Wirtemberg, extending about eighteen miles between the marquisate of Anspach on the north, and the dutchy of Neuburg and the Danube on the south: its greatest breadth is about twelve miles. The lords of this country are divided into three branches; but all the three lines have one custom-house and steward in common, which are both accountable to the chamber of regency. The inhabitants are partly Roman catholic and partly Lutheran. The country is divided into four prefectures, the principal place of which is

Oettingen, the capital of the county, and the residence of the princely line of Oettingen-Spielberg, is seated on the Wernitz, and is the seat of the regency and treasury, and also of the Lutheran consistory of the princes and counts in common. There are here a society for the improvement

provement of arts and sciences; a grammar-school, a college of Jesuits, a commandery of the Teutonic order, and an orphan-house.

The county of Eberstein lies in the Black Forest, between the dutchy of Wirtemberg and the margravate of Baden, and is watered by the Murg, by means of which a great number of floats of timber are carried into the Rhine. It belongs to the margrave of Baden-Baden, to whom it gives an additional seat and vote in the college of Swabian counts at the diet of the empire, and also in that of the circle. This county contains

Eberstein, a market-town, near which is a castle.

Gerspach, a small town seated on the river Murg, the inhabitants of which are a mixture of Protestants and Papists.

In this county is also a Benedictine abbey for ladies, called Frauenalb, from its being seated on the river Alb; and likewise several villages.

There are some other little territories too minute for description in so extensive a work as this; we shall therefore only add the following lordship:

Mindelheim is situated between the bishopric of Augsburg on the north-east, and the territories of the abbey of Kempten on the south-west. It is a pleasant fruitful territory, about ten miles square. In the beginning of the last century duke Maximilian of Bavaria made himself master of it, and transmitted it to his descendants; but the elector of Bavaria being put under the ban in the year 1706, the emperor raised this lordship to a principality, and conferred it as a fief on the most illustrious duke of Marlborough, who was created a prince of the empire, and also invested with a seat and vote, not only on the bench of princes of the circle of Swabia, but likewise in the imperial diet. However, by the peace of Rastadt and Baden, in 1714, Mindelheim reverted again under its antient title of a lordship to the elector of Bavaria, who on that account enjoys both a seat and vote on the bench of counts and barons of the Swabian circle.

Mindelheim, the capital, is situated in a plain on the river Mindel, about twenty-seven miles to the south-west of Augsburg, and is an open town, with a castle on a hill, built more for ornament than defence: it has a parish-church, a college of Jesuits, a gymnasium, and a Franciscan convent.

S E C T. VIII.

Of the Austrian Countries in Swabia not included within the Circle, and the principal Places they contain.

THE extent of the imperial dominions in Swabia cannot be determined, with respect to their length and breadth, with any degree of certainty, they being in many places intersected by other territories.

This country is of moderate goodness; it produces all sorts of corn, and towards the lake of Constance, like-

wise wine. The countrymen, who are Roman catholics, subsist here in summer by labouring in the fields and vineyards, and in winter chiefly by spinning.

This part of Swabia is divided into Upper and Lower jurisdictions; in the former are thirteen prefectures, and in the latter ten divisions, the principal places in which are,

Rotenburg, a small town seated on the Neckar, and in the lower county of Hohenberg. It was destroyed by an earthquake, in the eleventh or twelfth century; but was afterwards rebuilt, and at present contains a citadel, with a fine college of Jesuits, and a Carmelite cloister. Before the gate stands a celebrated church named Weckanthal, and in its neighbourhood is a medicinal spring.

In this part of Swabia is Austrian Brisgaw, which lies on the east side of the Rhine, that river dividing it from Alsace; it is seated between the Ortenau on the west, and the principality of Furstenberg on the east. The principal places in this district are the following:

Freyburg, the capital of the province, is seated in the river Treisam, and was formerly an important fortress. It has been three times taken by the Swedes, and as often by the French, who in 1745 demolished its fortifications. It has a regency appointed over a part of the Austrian territories in Swabia, an university, a college of Jesuits, and several cloisters.

Old Brisach, thus called to distinguish it from New Brisach, which belongs to the French, and is seated on the other side of the Rhine. Old Brisach is seated on an eminence, and was formerly an excellent fortress, which in 1688 was taken by the French; but in 1697 was again restored, and in 1703 was taken a second time; but in 1715 was again given up to the house of Austria; but at length, in 1741, the present empress caused the fortifications to be razed.

Rheinfelden, one of the forest towns, is seated on the south side of the Rhine, and is defended by good fortifications. On the opposite bank of that river is a covered way built in the manner of a horn-work, and having a communication with the town by means of a bridge. The Rhine at this place runs with great violence into a rocky tract a mile in length called the Gewild, through which ships are let down by ropes.

Villingen, a town situated in a fertile tract on the Briege. The streets are regularly laid out and well paved. This place, by means of the circumjacent mountains, and narrow passes leading to it, is extremely well secured. It has also some fortifications: hence in 1633 and 1634 it was besieged in vain, and in 1704 bombarded without effect by the French, though it had been taken by them in 1688. It has always served the Austrians as a magazine for provisions and military stores. It has an abbey of Benedictines, and in its neighbourhood is a good bath.

C H A P. XX.

Of the Circle of B U R G U N D Y.

S E C T. I.

Of the Circle of Burgundy in general ; with a particular Account of the Austrian Share of the Dutchy of Brabant. Its Situation, Rivers, Government, and Arms ; with a Description of its principal Cities, particularly Louvain, Brussels, Antwerp, and Mechlin.

THE tenth and last circle of the German empire is that of Burgundy ; but the greatest part of its territories have been torn from it. France has gradually brought under her dominion the dutchy of Lorrain, which was formerly reckoned in this circle, and also a part of the dutchy of Luxemburg, together with a part of the county of Flanders, and the counties of Artois and Burgundy, or French Compté, and a part likewise of the counties of Hainault and Namur. The provinces of Gueldres, Holland, Zealand, Utrecht, Friesland, Overysse, and Groningen, have raised themselves to liberty and independency ; nay, after their union, by the force of arms, they reduced to subjection a part of the dutchies of Brabant and Limburg, and likewise of the county of Flanders, with the city of Maestricht, and its territory. Lastly, the king of Prussia has also the possession of a part of Upper Gueldres.

Thus the circle of Burgundy at present consists only of the principal part of the dutchies of Brabant, Limburg, and Luxemburg ; and also of a part of the counties of Flanders, Hainault, Namur, and a part of the upper quarter of Gueldres. These territories, which, together with the Netherlands, devolved, on the death of Charles V. to the Burgundian Spanish line of the house of Austria, fell, after the death of Charles II. king of Spain, to the German line of the house of Austria, the emperor Charles VI. having, by the peace of Baden in 1714, and by that of Vienna in 1725, secured them to his house, and after his death they came to his daughter and heiress Maria Theresa.

This circle is wholly Catholic.

The Burgundian envoy sits at the imperial diets in the council of the princes of the empire ; and the Austrian governor-general resides at Brussels.

We shall begin this circle with the Austrian share of the dutchy of Brabant, which terminates to the north, on that part of the dutchy possessed by the republic of the United Provinces, to the east on the bishopric of Liege, to the south on Hainault and Namur, and to the west on Flanders and Zealand. The whole dutchy, which is a hundred and four miles in length, and ninety-five in breadth, was formerly the first in rank of all the seventeen provinces of the Netherlands. The southern part of this dutchy is very mountainous.

The air of Brabant is good, and its soil very fertile. Its greatest riches consist in its flax.

A part of the country is watered by the river Demer, which receives into it the lesser rivers of Gheete, Dyle, Senne, and Nethe ; after which it takes the name of Rupel, and loses itself in the Scheld, which, to the west, borders on Brabant.

Near Brussels a canal has been carried on from the river Senne to the village of Willebroec, where it discharges itself into the river Rupel, which soon after unites in such a manner with the Scheld, that a person may sail from Brussels to the North sea. This canal was begun in 1550, and finished in 1561, at the expence of eight hundred thousand florins. In 1753 a canal was begun to be carried on from Louvain to the Rupel, which divides the Dam between the Louvain and Mechlin into two equal parts, and is now brought to bear. Among other public works a stone causeway between Louvain and Brussels was built in 1710, and another in 1726 reaching from Louvain to Thienen and Liege.

The whole country professes the Romish church ; and in 1559 an archbishopric was erected at Mechlin by Pope Paul IV. under whom are fourteen collegiate churches and two hundred and three cloisters. To the same archbishopric are subject the prelates of Antwerp, Ghent, Boisleduc, Bruges, Ypres, and Ruremond.

For the promotion of learning in this country here are several schools and seminaries, as also the university of Louvain.

The states of Brabant consist of three classes, the abbots of a number of towns, and all the princes, dukes, counts, and barons of this province, with the burgomaster and pensioners of the towns of Louvain, Brussels, and Antwerp. This college usually meets four times a year, when it chooses four deputies, namely, two out of the clergy, and two out of the nobility, who have their meeting daily. There is also a council pensioner, who is perpetual secretary of the college.

The arms of this dutchy are a lion or, in a field sable.

Both the above states and the chancery of Brabant meet at Brussels, and at the same place are also the state council, the privy council, the domain and finance council, the rent chamber, and the chief court of Brabant.

In the Austrian part of Brabant are reckoned nineteen walled cities, and a considerable number of immunities or boroughs, the inhabitants of which enjoy the rights of burghers. The principal places in this dutchy are Louvain, Brussels, Antwerp, and Mechlin. We shall begin with the first.

Louvain, called by the natives Loeven, and in Latin Lovanium, is seated on the river Dyle, and is of very considerable extent ; but while some represent the circle within the walls as twelve English miles, others affirm that the walls are only six or seven miles round. It was formerly the capital of the country, and had a flourishing trade from the manufactures of linen and woollen established there, which in the beginning of the fourteenth century, maintained upwards of one hundred and fifty thousand manufacturers ; but the cloth weavers making an insurrection in 1382, and being punished on that account, a great number of them withdrew to England, and together with its manufactures, the city also decayed ; but its trade has been attempted to be revived by making the new canal.

Within the walls are large meadows, beautiful vineyards, with pleasant gardens and orchards. It stands in the fifty-first degree twelve minutes north latitude, and in the fourth degree forty minutes east longitude, in a very fruitful soil, and in so pleasant and fine an air, that wine is made both within the walls and without.

The town-house is a fine building in the old taste, adorned with statues on the outside, and much embellished within. The magistrates meet here twice a week, and are more numerous than in most other towns in the Low Countries ; for they have two burgomasters, seven aldermen, two recorders, six secretaries, and four treasurers, besides a council of twenty-one, eleven of which are country gentlemen, and the other ten are deacons of the trades.

The city contains five parish churches, which are very noble structures, and among them the collegiate church of St. Peter is one of the most magnificent in the whole country. Its steeple has been esteemed a master-piece ; it was five hundred and thirty feet high, and on each side of it was another four hundred and thirty feet in height ; but the larger steeple was blown down in a storm in the year 1606. The chapter of this church consists of a provost, a dean, a chanter, eighteen honorary prebends, and ten canons, who must all be professors of different sciences in the university. The chapels belonging

ing to this church are finely adorned with sculpture and painting.

Without the town is a college of Jesuits, fifteen monasteries, and as many nunneries. The church belonging to the Jesuits convent was built in 1666, and would pass for a beauty even at Rome. Their pulpit of oak is the finest piece of that kind in the world: on the bottom is represented the fall of man, and above, the redemption of man by the virgin's treading on the serpent's head. Among the nunneries, the convent for the English is the finest in the Low Countries, and very richly endowed.

The university was founded in 1425, by duke John IV. and contains forty-one colleges. It enjoys very great privileges, granted by the popes and the dukes of Brabant. The principal person in the university is the rector magnificus, who enjoys his office for three months; but is generally continued for three more. He is chosen from among the professors of the five faculties, divinity, the canon law, the civil law, physic, and the liberal arts. Here are two other honourable posts, that of conservator of the privileges of the university, and the chancellor: the former is elective, and the latter annexed to the provostship of St. Peter's church. The hall where the public exercises are performed, is a large building of freestone, and a great ornament to the city, and in it are three spacious rooms, where lectures are read in divinity, law, and physic, to which the scholars in every college may resort.

In the year 1542, Martin Rossem, the general of the Guelderlanders, attacked this city without success. In 1572, William prince of Orange besieged it; but the burghers, assisted by the students, made so brave a resistance, as to oblige him to raise the siege. In 1635 it was besieged in vain by the French and Dutch, and on the fifth of August 1710, the French entered the city by surprize; but were bravely repulsed by the inhabitants, who obliged them to retire in confusion; for this Charles V. king of Spain, and afterwards emperor, sent them a golden key, which is still kept as a curiosity in the town-house. However, in 1746, the French made themselves masters of this place, and kept it till the year 1749.

The territory belonging to the jurisdiction of Louvain is very large, and contains eighteen large manors, or districts.

Brussels, called by the French Bruxelles, and in Latin Bruxellæ, is the capital of Brabant, and the usual residence of the governor-general of the Netherlands; it is seated on the little river Senne, which runs through it, in the fiftieth degree fifty minutes north latitude, and in the fourth degree six minutes east longitude. This city makes a noble appearance, it being on the brow of a hill, and from below, the whole of it is seen. Indeed, no city in Europe makes a more beautiful figure at a distance, except Naples and Genoa; and like them, when you are in the town, it is all up and down hill. It has seven gates, out of each of which are large suburbs, in which the citizens have their gardens. The city is surrounded with a double brick wall and a pretty large interval between, and small ditches; but the place is too big to hold out a long siege, it being about seven miles in circuit.

The streets are very spacious, though steep, and the houses are generally pretty high. Here are seven fine squares, among which that of the great market-place is one of the most beautiful in Europe. The town-house where the magistrates meet, takes up one side, and is a noble pile, which has a tower about three hundred and sixty-four feet high, with a statue on the top, of St. Michael in copper gilt, the patron of this city, killing the dragon, and though seventeen feet high, it serves for a weather-cock. In this structure is the apartment wherein the states of Brabant meet, which is the best adorned of any in Europe. Here are particularly three large rooms, one of which contains the resignation of Charles V. in tapestry, so finely executed, that it is said to exceed every thing of the kind in Europe. It is set up in gilt frames; and the other rooms belonging to this assembly are finely adorned with original paintings.

Opposite to it is the imperial palace, the entrance into which is by a spacious court. The palace stands on an eminence, and on the left hand is a large hall that leads to the imperial chapel, which is adorned on the outside like that of Henry VII. in Westminster-abbey. Fronting the gate of the court is the entrance into the royal apartments, which are very noble, but irregular, having been built at different times, and under them is a terras fronting a beautiful parterre, on which are brass statues of the emperors and dukes of Brabant: indeed, the whole square is surrounded with pillars of the same metal. Upon one of the towers is a bird pierced with an arrow, in memory of the Infanta Isabella shooting a bird. Behind the palace you descend by a pair of hanging stairs into the above parterre, which is adorned with fountains and ever-greens; and behind it is the park, where every body has the liberty to walk, and is adorned with vistas, grottos, fountains, and other water-works; it is also well stocked with deer. What is most surprising in this park is the eccho, which makes ten or twelve distinct reverberations. At the further end of the park is a fine pleasure-house built by the emperor Charles V. after his abdication; whence it is called the emperor's house.

Round the other parts of the great market are the halls of the different trading companies, who have each a large room for themselves, and the rest of the building serves for a tavern. These halls are all of an equal height, and the fronts are adorned with sculpture, gilding, and Latin inscriptions.

The armoury was formerly well furnished; but has now only some few remains, as the armour of Charles V. the duke of Alva, the cardinal Infante, and some others; as also the figures of several emperors and dukes in armour on horseback, and on foot, with curious antique arms, according to the different manner of the several courts of Germany.

Near the arsenal are the palaces of the prince of Orange, the prince of Ligne, the duke of Aremberg and Arscot, the princes of Epinoy, Rubenpre, and Egmont, and in the gardens of the latter is a fine labyrinth. But the most agreeable gardens on account of their situation, are those belonging to the dukes of Bournonville, from which you not only see every house in Brussels, but have an extensive view into the country. In all these palaces are collections of original paintings by the most celebrated masters, both Italian and Flemish.

The opera-house in Brussels was built by the duke of Bavaria in the year 1700. This is one of the noblest and largest in the world, it being erected in the Italian taste, with rows of lodges, or closets, which the nobility generally take for the winter season to accommodate their families and friends, and of which they keep the keys. That of the prince de Ligne is lined with looking-glass; so that he can sit in a corner of his lodge with half a dozen friends, drink a bottle, or eat a supper, which they often do, by a good fire, and at the same time see the representation in the looking-glass, without being seen either by the actors or the company.

There are in this city twenty public fountains, adorned with statues at the corners of the most public streets. In that of the herb-market are represented four beautiful young women that squeeze the water out of their breasts, which spout night and day to a great distance. The fountain in the middle of the town-house is much admired; it represents Neptune and his Tritons spouting out water, as a horse also does from his mouth and nostrils.

The churches of this city are very magnificent, seven of these are parochial, and among them the church of St. Gedula, which is also collegiate, is the largest and finest. It stands on the top of a hill near the Louvain-gate, and is surrounded with iron balustrades. It is an old Gothic building, with two large steeples at the east end; but is finely embellished within. On the pillars in the body of the church are, on one side, the statues of our Saviour and six apostles, and on the other the Virgin Mary, with the six other apostles, all as big as the life. The little chapels on each side are finely adorned with

with paintings and marble balustrades. In the choir are several fine monuments of illustrious princes, as the archduke Albert and his wife; Isabella, Infanta of Spain; John duke of Brabant, with his wife; Mary daughter to Edward IV. king of England: but the finest is that of Ernest archduke of Austria, and governor of the Netherlands. In one of the little chapels they worship three hosts, which they pretend were stabbed by a Jew, about the year 1369, and bled. These are exposed every festival in a chalice richly set with diamonds. In order to perpetuate the memory of this event, there is a yearly procession on the Saturday after the thirteenth of July, when these hosts are carried round the city, and attended by all the regular and secular clergy, the magistrates, courts of justice, and even the governor of the province. The chapel where they are kept is built entirely of marble, and the altar is of solid silver.

Here is a college of Jesuits, which has a very fine church, eleven monasteries, and twenty-one nunneries; among which are two English, one of Dominican ladies, founded by cardinal Howard in the reign of Charles II. king of England, of which one of the house of Norfolk is always abbess, the other is of Benedictine nuns.

The Beguinage, or the foundation of pious maids, resembles a little town, and is surrounded by a well and ditch, and divided into pretty little streets, where every Beguine has her own apartment. Their number generally amounts to seven or eight hundred, and sometimes more. They are governed by four elderly women, whom they choose out of their own body, and have a confessor, or chaplain, appointed by the bishop of Antwerp. Their church is a fine piece of architecture lately built.

The Mount of Piety in this city is a public office for lending money upon pledges at a moderate interest, and was established by the archduke Albert, and Isabella his wife, in the year 1617. It is a vast building, like a monastery; and there are private passages for going in, without being seen from the public streets. The archduke put it for ever under the protection of the archbishop of Mechlin and the chancellors of Brabant, as governors; and they put in a superintendent and other proper officers, by which it is governed. This has succeeded so well, that the magistrates in all the great cities of the Netherlands have erected others in imitation of it.

The antient inhabitants of Brussels have shewn a singular fondness for the number seven; for here are seven principal streets that enter into the great market-place, in which are seven stately houses; seven parish-churches; seven noble families, eminent for their antiquity and great privileges; seven midwives, sworn and licenced by the senate to visit the poor as well as the rich, whenever called; seven public gates of the Doric order, remarkable for leading to so many places of pleasure or different exercises, namely, one for hunting, a second for fishing, a third for fowling, a fourth leads to pleasant fields, a fifth to pasture grounds, a sixth to springs and vineyards, and a seventh to pleasant gardens.

This city is said to have entertained at one time seven crowned heads, besides the dukes of Savoy and Lorrain, with nine thousand horse belonging to their retinues. The inns, or eating-houses, at Brussels, are equal to any in the world; and a stranger has the advantage of dining any time between twelve and three, on seven or eight dishes of meat, for less than an English shilling. The wines here are also very good and cheap, and for an English six-pence every hour you may have a coach that will carry you wherever you please.

In the beginning of this section we have mentioned the canal which passes by this city. By the way of this canal treckschuyts go twice a day from Brussels to Antwerp and back again. These treckschuyts, or draught-boats, are so called from their being drawn by a horse, and are long covered boats, with windows on the sides, and two benches within placed lengthways, on each of which fourteen or fifteen passengers may conveniently sit. Each boat is drawn by a single horse, at the rate of about three miles an hour, and the fare of each passenger amounts to no more than about two-pence farthing for every hour. The canal is made like those in Holland, with broad straight quays planted with trees, where the ladies take the air in their coaches, going out

at the gate of Villevort, or Vilvorden, where there is a fine road, with four rows of trees on each side along the canal for several miles, and from the canal is a stately flight of steps which leads to the walls, on which one may walk, under the shade of trees, quite round the city.

It must be confessed, says Mr. Milson, that few cities in Europe can compare with Brussels for good company; as abundance of people of quality either live in, or resort to this city, who are easy of access, especially to strangers. Every night, both in winter and summer, they take a tour in their coaches, where the men, as is practised at Rome, never go in the same coaches with the women, but for a very different reason; for as in Italy it is done to avoid the conversation of both sexes, they separate here out of a mere piece of gallantry; for the gentlemen always keeping one circle, and the ladies another, they meet continually, and thus have the opportunity of talking to, or ogling one another at pleasure; but the worst of it is, that their continual salutations as often as they meet is no small interruption to this general society.

There is another pleasant custom, says the same author, observed among the citizens of Brussels on the nineteenth of January, when the women undress their husbands and carry them to bed, and the husbands are obliged to treat their friends the next day. They give two reasons for the original of this custom. The first is, that the city being reduced to such extremity, as to be obliged to surrender to the enemy, the women only were allowed to escape, and to carry with them what they esteemed most valuable; when, instead of their ornaments, they all marched out with their husbands on their backs. Others alledge, that a good number of the citizens of Brussels, following St. Lewis in his first crusade, most of them had the good fortune to escape the general destruction; and afterwards coming home in a body, their wives rejoicing at their return, met and caught them in their arms, and carried them home.

Among the peculiarities of this country it is observable, that people, both at Brussels and other towns in the Netherlands, have dogs to draw the little carts in which they sell fruit and other commodities about the streets.

Brussels is particularly famous for its tapestry, camblets, and bone-lace, which are exported from thence.

With respect to its history, we shall only observe, that in 1695 it was furiously bombarded by the French during forty-six hours, by which means fourteen churches and above four thousand houses were reduced to ashes; but within four years they were rebuilt with greater beauty than before. In the year 1708 it was besieged by the elector of Bavaria; but the duke of Marlborough made him decamp with precipitation. In 1746 it was taken by the French; but was restored to the emperor by the treaty of Aix la Chapelle.

The territory and jurisdiction belonging to this city is of very large extent, and contains several manors and lordships, in which are many considerable villages.

The city of Antwerp, called by the natives Antwerpen, by the French Anvers, and in Latin Antverpia, or Andoverpum, is the capital of a marquisate of the same name, and is seated in a low and fenny ground on the east side of the Scheld, in the fifty-first degree fifteen minutes north latitude, and in the fourth degree fifteen minutes east longitude. It is built in the form of a crescent, and is said to be three thousand six hundred and thirty-five geometrical paces in compass. The streets are generally large, straight, and well paved; but the houses are built in a manner peculiar to itself, half of brick, and half of wood, with a kind of battlements on the top, and very high roofs, which give them an antique appearance. The fortifications are not so much celebrated for their strength as their beauty; the ramparts being almost every where adorned with double rows of trees, which in summer afford delightful and shady walks. The citadel, however, is a strong and regular fortress. The Scheld, both at Antwerp and two leagues above and below it, is deep and broad, which greatly contributed to the flourishing state of this city in former times, when it had the reputation of being the richest and most frequented port in Europe. The records of this city mention

tion a merchant, named John Daens, who having lent a million of gold to Charles V. afterwards invited that emperor to dinner, where, after a noble entertainment, he threw the emperor's bond into the fire, which was of cinnamon, a spice which at that time bore a higher price than at present.

In the city are twenty-two public squares, and two hundred and twelve streets. Most of the houses have court-yards before, and gardens behind. The principal street is called Mere, which is so broad that six coaches may go a-breast, and the houses here are generally of free-stone. At the upper end of this street is a fine brass crucifix thirty-three feet high, placed on a marble pedestal. The city has seven gates, from each of which runs a long street terminating at the cathedral, which is placed about the middle of the city. On the top of the gate which leads to the quay stands the statue of a giant. This gate, as well as several others in the city, was designed by the famous painter and architect Sir Peter Paul Rubens, who was a native of Antwerp.

The citadel, which is esteemed one of the strongest in Europe, is very regular. It is an exact pentagon, and stands on the south side of Antwerp, on the banks of the Scheld, and commands the town, the river, and the neighbouring country. The erecting of this fortress, by order of Philip II. king of Spain, was the first check given to the trade of this city, which was before a free port. It has five bastions, which, from the regularity of the figure of the citadel, defend one another: it has large and deep double ditches, with only one gate, and is said to be about two thousand five hundred paces in circuit.

The exchange of Antwerp has four spacious gates opposite to each other, and always open. The walks round it are supported by forty-three pillars of blue marble, all carved with different figures, not two of them being alike. This structure is said to be a hundred and eighty feet long, and a hundred and forty broad. Underneath are vaults, or magazines, well stored with merchants goods; and above is an academy for painting, sculpture, architecture, and the mathematics. The building of this exchange cost the city of Antwerp three hundred thousand crowns. From this structure, which was the first of the kind in Europe, Sir Thomas Gresham took the model of the Royal exchange he erected in London, as did also the burghers of Amsterdam that of theirs.

The town-house is a very grand piece of architecture built with free-stone, with a fine frontispiece adorned with a variety of statues, a cupola, and an eagle at the top. It stands in the great market-place, which is a very spacious square, in which are all the public executions. The house of the Hanse-towns, for the convenience of the Eastern merchants from the Baltic, called Easterlings, was built in the year 1568, when the trade of Antwerp flourished, and is a square building of stone two hundred and thirty feet each way, with magazines in the upper parts for dry goods, and cellars below for wet. In the middle story, which has a gallery quite round an inner square, are three hundred lodging-rooms for merchants. But this structure is now turned into horse barracks, the cellars of which serve for stables, and the rooms above for hay-lofts.

The markets of Antwerp are at a proper distance from each other, each having a particular square. The fish-market by the river is very spacious; but the most curious of them all is the Friday-market, as it is called, where, on every Friday, all sorts of household-goods, pictures, and jewels, are sold by auction, and often at a very cheap rate; for when a person dies who leaves a family of children, his pictures are all sent to the Friday-market, and the money arising from their sale is equally divided among them.

No city in the Netherlands has so many churches and such fine structures as those of Antwerp, which is the see of a bishop suffragan to the archbishop of Mechlin. There are here four collegiate churches, three other parish churches, four abbeys, and about sixty cloisters of the first rank. The cathedral of Our Lady, which is also a parochial church, is a very grand pile, upwards of five hundred feet long, two hundred and thirty broad, and three hundred and sixty high. Its spire is four hun-

dred and sixty-six feet in height, the cross at the top one hundred and fifty-one, the diameter of the clock thirty feet, and its circumference ninety. In its belfry are thirty-three great bells, and two sets of chimes. The three principal gates of this cathedral are adorned with marble and gilding, and the altars are embellished with fine paintings, some of them by Rubens. The picture which represents the taking down of our Saviour from the cross, in which the figures are as big as the life, is reckoned a master-piece. Here are also some curious pieces by Quintin Massieys, a blacksmith, who falling in love with a painter's daughter, asked her in marriage; but her father answered, that he would never bestow her on any except a painter. Upon this the blacksmith going to Italy, entered the Lombard school, and in a few years returning a greater master than the father of her he admired, he married her. At the entrance into this cathedral he is interred, where his effigy is put up with this inscription:

Connubialis amor de Mulcibre fecit Apellem.

That is,

“Connubial love transformed Vulcan into Apelles”

In this cathedral Philip II. king of Spain, after the voluntary resignation of his father, the emperor Charles V. held on the twenty-first of January, 1555, a chapter of the order of the Golden Fleece, in which he created nineteen new knights, among whom were the seven following kings: Henry VIII. of England, Francis I. of France, his uncle Ferdinand king of the Romans, Christian king of Denmark, John of Portugal, Sigismund of Poland, and Maximilian of Bohemia, whose banners are still hanging in the choir.

The church belonging to the Jesuits college is esteemed one of the finest in Europe. The front is a noble piece of architecture, on the top of which is a statue of Ignatius Loyola. All the inside is paved with white marble, and the galleries were supported by fifty-six marble columns. The great altar is also of marble, intermixed with jasper, porphyry, and gold; and on the ceiling are thirty-eight pictures from the history of the New Testament, done by Rubens and Vandyke. The carving is most excellent, and the flower-work by Segers, a Jesuit. The chapel of the Virgin adjacent to it is still more magnificent. The picture of the Assumption of the Virgin on the great altar was done by Rubens, and called by him his favourite piece; round it are six statues of alabaster representing the founders of this chapel. The church was much damaged some years ago, and the marble galleries beaten down by thunder; but it has been pretty well repaired, though the galleries have not been rebuilt. In the Jesuits college is also a library, which takes up four chambers.

The Carmelite church is famous for its having a large silver statue of the virgin Mary.

On the banks of the river near the ramparts stands the noble and rich abbey of St. Michael, where all sovereign princes lodge on their coming to this city. The apartments are truly grand, and the refectory or hall, where the monks dine, is said to be as large and as well painted as that of St. George at Windsor. The monks are of the order of St. Norbertus, archbishop of Magdeburg, who came to Antwerp in 1124, and established this order here; and his pretended miracles are painted round the church belonging to the abbey.

There are nineteen nunneries in this city, among which is an English one of the order of St. Theresa; but the nuns wear no linen, eat no flesh, and lie upon straw: even the grates have such a dismal appearance, that they give the place the resemblance of a prison.

Among the many privileges granted this city by its princes, one is, that any person born in Antwerp is a citizen, though both the father and mother are foreigners.

Towards the middle of the sixteenth century there were computed to be no less than two hundred thousand inhabitants and strangers who lived in the city; but during the civil wars it suffered much, particularly in 1576, when it was plundered for three whole days together by the Spaniards. But what has most contributed to reduce this city, was the peace concluded at Munster in

1648, between Spain and the United Provinces, when it was agreed, that no large ship should go directly to Antwerp, but unlade its wares in Holland. In 1659 many of the inhabitants, on account of an insurrection, being obliged to quit the town, and an infectious disease some years after carrying off great numbers, the place fell of course into great decay. However, the tapestries and lace made here are very fine; and for the promotion of trade an important insurance company has been erected.

With respect to the history of this city, it is proper farther to add, that Francis of Valois, duke of Alençon, and brother of king Henry III. of France, being installed duke of Brabant at Antwerp in 1582, and appointed governor of the Netherlands by the states-general, thought his authority circumscribed within too narrow bounds; and to render himself more absolute, resolved to surprise the city. Accordingly on the 17th of June 1583, causing seventeen companies of infantry to enter the gates, he himself drew near the walls with his army, who were all Frenchmen, as if only to review them. But the citizens, discovering his design, made so brave a defence, that they drove the French out of Antwerp, killed about fifteen hundred of them, among whom were about three hundred noblemen, and took upwards of two thousand prisoners. After which the duke retiring into France, died with grief.

In 1585 the duke of Parma, governor of the Netherlands for the king of Spain, took Antwerp, after a siege of twelve months, which was one of the most remarkable in history. He re-established the Roman catholics, who had been but lately banished the city, and restored it to the crown of Spain. It was seized by the French on the death of Charles II. in the year 1700; but tho' it was provided with a strong garrison, it surrendered to the duke of Marlborough in 1706, about a month after the memorable victory that great general obtained over the French at Ramillies. In short, the barrier treaty between the emperor and the republic of the United Provinces was concluded here in 1715; and the French made themselves masters of this city in 1746, but restored it to the emperor, at the peace of Aix-la-Chapelle.

The territories belonging to this city are very extensive.

The city of Mechlin is large, well built, and seated on the Dyle and Demer, sixteen miles to the south-east of Antwerp, in the fifty-first degree twenty minutes north latitude, and in the fourth degree thirty-one minutes east longitude. It has many artificial canals, and broad and clean streets. It is a fortified place, but of no considerable strength, and is the see of an archbishop, who bears the title of primate of all Belgium, as also the residence of a governor, who has a provincial court here. It is divided into six parishes, each of which has a fine church. The cathedral is a large and noble structure, that is said to have the highest steeple in the country. The parish church of Our Lady is collegiate, and the parochial church of Our Lady of Hanswyck is a priory of regulars of the order of St. Augustine, and of the congregation of St. Genevieve. There are here nine monasteries, a commandery of the Teutonic order, a college of Jesuits, and an archiepiscopal seminary; there is also said to be a Beguinage, which generally contains about seven hundred young women, who maintain themselves by working, and make no vows. St. Rombant, an Irishman, and bishop of Dublin, is the patron of this city, and his remains are kept in a silver shrine.

In the arsenal are cast great guns, mortars, &c. Here Philip II. king of Spain built an hospital for wounded and superannuated soldiers.

The magistracy consists of a high bailiff, two burgo-masters, and twelve echevins. The concurrence of this little lordship is necessary to the enacting of laws, and raising of money. The inhabitants carry on a considerable trade in corn, thread, and blankets; but the principal manufacture of this city is that of the fine laces so famous throughout Europe.

The most remarkable circumstance relating to the history of this city is, that in the year 1547, a tower being set on fire by lightning, communicated to two hun-

dred quintals of powder, which instantly blowing up, destroyed almost the whole city.

SECT. II.

Of the Austrian Part of the Dutchies of Limburg and Luxemburg, with a particular Description of the Cities of Limburg and Luxemburg.

THE Austrian part of the dutchy of Limburg consists of good arable land, and particularly abounds in a fine breed of cattle. In the neighbourhood of Limburg are found iron, lead, and calamy. Great part of this dutchy being at present subject to the states-general, it will be described under the republic of the United Provinces: we have only to add here a very few particulars. The arms of the dutchy are a lion azure in a field or.

The states of the country consist of prelates, nobles, and high jurisdictions. The Austrian part of the dutchy is under a governor, and consists of nine small districts, the principal place in which is,

Limburg, the capital of the province, seated on a fine and fruitful hill, at the foot of which runs the little river Wese, in the fiftieth degree forty-six minutes north latitude, and in the sixth degree fourteen minutes east longitude. In its neighbourhood are several quarries of different sorts of marble, and all around are surprising mountains, rocks, and precipices. It was regularly fortified and defended by a castle on a very steep rock, flanked with towers and bastions of free-stone; but in 1675, the French under the prince of Condé laid siege to it, while the French king himself, with another army, hindered the prince of Orange from relieving it; so that after eleven days open trenches, the governor was obliged to surrender; and in 1677, the French, foreseeing that they should be obliged to restore the city at the peace, blew up the castle, destroyed the fortifications, and burnt the whole town, except the church and parsonage-house. The next year it was restored with the province, by the treaty of Nimeguen; but in 1703, the allied army under the duke of Marlborough made themselves masters of the city, which the French had seized in 1700, and took the whole French garrison, with the governor, prisoners of war, and it was soon after restored to the emperor. The city is again pretty well fortified; but has only two gates. The parish church of St. George is a fine and large structure, with a steeple of free-stone; but has suffered very much in the several sieges it has undergone. Here is also a convent of Capuchins, and another of penitent nuns.

The dutchy of Luxemburg is bounded on the east by the electorate of Treves, on the south by the dutchy of Lorrain, on the west by Champagne, on the north by the bishopric of Liege and the dutchies of Limburg and Juliers. In its utmost extent from north to south it is about ninety-five miles, and about as many from east to west.

It lies in the center of the forest of Ardennes, but its soil is not very fertile, though it produces some corn, and has a good breed of cattle, with wine and all sorts of game; but its principal riches consist in its many iron-works and founderies for cannon.

It is watered by many small rivers, the principal of which are the Semois, the Ourt, the Lasse, and the Chiers, which discharge themselves into the Maese, together with the river Sure, which receives into it some smaller streams, and also the Kyll, both which flow into the Moselle. The Maese washes this dutchy on the west, and the Moselle waters a part of the country to the south-east.

The inhabitants are of the Romish religion, and in the whole dutchy, besides the principal city, are twenty smaller towns.

The arms of the dutchy are a lion gules, in a shield divided into ten parts, azure and argent.

The states consist of the clergy, the nobles, and the deputies of several towns. The abbot of St. Maximin, who possesses large revenues in this dutchy, is primate of the

the states, though his abbey is seated near Treves. Over the dutchy is appointed an Austrian governor. At the city of Luxemburg is a judicatory of nobles filled up entirely by persons of antient nobility, who have at their head a president, styled a judge. The provincial-council was erected by the emperor Charles V. and consists of a president, three noble and three learned counsel, a general procurator, and a secretary.

In the whole dutchy are twenty-three small towns, besides the capital, which we shall next describe.

Luxemburg, the capital of the dutchy, is seated on the river Elz, at its confluence with the rivulet of Petreuse, and is one of the strongest fortifications in the Netherlands. It is divided into the Upper and Lower town: the former resembles an heptagon, and lies partly in the plain and partly on a rock; the latter is seated amidst deep valleys, and consists of two suburbs. The principal church is that of St. Nicholas, which is parochial, but not very remarkable; and therefore when any public act of devotion is to be performed, it is done either in the church of the Jesuits or Recollets, which are both large and beautiful. Here are three other parishes, one of which belongs to the Benedictine abbey of Munster; there are also three convents of men, and the like number of women.

This city suffered greatly by the wars between France and the Netherlands. In 1542 it was sacked by the French under Charles duke of Orleans; but retaken the following year by Gonzague, general of the emperor Charles V. In 1683 it was bombarded by the French, and afterwards taken: they kept it by virtue of the treaty of Ratisbon, but were obliged to restore it to the Spaniards by that of Ryswic. The French retook it in 1701, and by the treaty of Utrecht it was given to the United Provinces as a barrier; but was surrendered to the late emperor in 1715.

As the Austrian part of the dutchy of Gueldres is very small, we shall defer an account of it till we come to the United Provinces, to whom the greatest part of this country belongs.

S E C T. III.

Of FLANDERS in general.

Its Situation, Extent, Fertility, Produce, and Rivers. The Religion and Manufactures of the Inhabitants, and the Divisions of the Country.

FLANDERS terminates to the north-west on the Northern sea; to the north on the Scheld, which parts it from Zealand; to the east on Brabant and Hainault; and to the south and south-west on Hainault and Artois. Its extent, taken by a right line drawn from the borders of Artois along the sea-coast to Antwerp, amounts to about ninety-five miles, and from the northernmost end of Cadzand to Marchiennes to above seventy-six; and if we draw it to the end of the narrow tract of the prefecture of Douay, to ninety-five miles.

This country enjoys a temperate and wholesome air, particularly to the south, it being partly level and partly mountainous. Its soil is in general fertile, and fit for agriculture; and towards the sea, and the borders of France, its degree of fertility is uncommonly great. The land bears almost all sorts of corn and garden-stuff; and some tracts, particularly those of Bruges and Ghent, may export corn, though that produced in other parts is sometimes not sufficient to supply the great number of its inhabitants. The riches of the country consist in its flax. The pasture grounds here are in many parts extremely fine, on which account the breeding of cattle is an important article, and here is made a great deal of fine butter and cheese. The breed of horses and sheep is likewise very considerable. Flanders produces fruits of various sorts; it has plenty of fowl, and, as it has forests and woods, it has a great number of deer, wild boars, and hares. It has likewise plenty of sea and river-fish.

Its principal rivers are the Scheld, which receives the Scarpe, the Lys, the Lieve, and the Dender. Some useful canals have been dug here, among which that

which extends between Ghent and Bruges is the principal.

The Flemings are of the Romish church, and king Philip II. erected three new bishoprics here, those of Ghent, Bruges, and Ypres. The inhabitants boast of their being the inventors of some important arts. They were the first in Europe who began to support themselves by weaving, and by dying of cloths and stuffs; and at Courtray was discovered the manner of weaving all sorts of figures in linen. In the fourteenth century William von Beukelszon, a native of Viervilet, taught the method of curing herrings; and in the fifteenth century John Van Eyck invented painting in oil. Indeed at present the manufactures of Flanders are far from being in their former flourishing state. There are here, however, still made silk and woollen stuffs, brocade, cotton, camblets, linen, lace, tapestries, wrought curtains, bed coverlets, and other worked stuffs.

This country became subject to the earls of Flanders in the ninth century; and in 959 Baldwin III. the fourth count, introduced weaving, and also appointed fairs and trade. In 1369 Philip the Bold, duke of Burgundy, marrying Margaret III. daughter and heiress to count Lewis I. at length obtained the county or earldom of Flanders; and his daughter Mary marrying Maximilian, archduke of Austria, Flanders became possessed by the house of Austria. The northern part of this country was ceded to the States-general partly by the peace of Munster, and partly by the barrier-treaty in 1715; and France in 1667 seized on the southern part.

Flanders consists of three parts: the largest of these, which is properly called the County of Flanders, and was formerly under the dominion of the French, has been divided, according to the languages spoken in it, into the German and Walloon. German Flanders terminates to the north on the North sea, to the east on Imperial Flanders, to the south on the Lys, and to the west on Artois and the New Foss; but Walloon Flanders borders to the north on German Flanders, to the east on the Scheld, to the south on the territory of Cambray, and to the west on the Lys and the county of Artois. All this part the emperor Charles V. by virtue of the stipulation made with Francis I. in 1526, set free from its dependency on France. The second part, which was called the Signiory of Flanders, or Imperial Flanders, from its being under the supreme jurisdiction of the holy Roman empire, comprehends the county of Alost, the land of Waes, and the four prefectures, as they are called, together with the land on the other side of the Scheld. The third part has obtained the name of Proper Flanders; this being neither dependent on France nor the Roman empire, but is under the jurisdiction of the counts of Flanders. To this part belong Dendermond, Bornheim, and Geersberg, with their districts.

The parts possessed by France and the United Provinces will be treated of in those countries, and we shall here only consider the territories in Flanders belonging to the house of Austria. In treating of this country we shall describe what is called its four members, which are the districts of Ghent, Bruges, Ypres, and the Frankeland; the principal places in which are Ostend and Newport.

S E C T. IV.

Of the Territories in Flanders belonging to the House of Austria; with a particular Description of Ghent, Bruges, Ypres, Ostend, and Newport.

THE city of Ghent, the capital of Flanders, called by the natives Gent, or Ghendt, by the French Gand, and in Latin Gandavum, lies thirty-five miles to the north-west of Brussels, in the fifty-first degree twelve minutes north latitude, and in the third degree thirty-six minutes east longitude. On account of its many running waters which unite near this city it has great advantages, both with respect to trade and strength; for not only the Scheld receives the Lys in this town, but from hence to Damme runs the Lieve, which is properly a canal, the digging of which was begun in the

year 1228, and, besides several rivulets, receives into it the Caele. The canal which extends from hence to Bruges, and from thence to Ostend, was begun in 1613, and is very remarkable. From another canal, which runs to the north, a branch extends from Rodenhuyfen to Sas van Ghent. Besides these, there are here several other canals and rivers. The city of Ghent is of considerable extent, its compass within the walls being computed at forty-five thousand six hundred and forty Roman feet. The rivers and canals within the city divide it into twenty-six islands, which are joined by as many great bridges, and seventy-two smaller ones; and, by shutting up the sluices, the country for a mile round may be laid under water. It is defended by a citadel built by the emperor Charles V. consisting of four regular bastions; but is not so conveniently situated for the defence of the town, as to command it, and keep the inhabitants in awe.

This city, at the request of king Philip II. was erected into an episcopal see, and made suffragan to Mechlin: the celebrated Cornelius Jansenius, from whom the Jansenists, that have raised such disputes in France, have their name, was the first bishop. This diocese contains seven deaneries, and a hundred and eighty-three parishes, seven of which are within the city. The cathedral, dedicated to St. John the Baptist, is a fine, large, and antient structure. There is also a collegiate and six parish churches. The abbot of the Benedictine abbey of St. Peter styles himself primate of Flanders, and president of the assembly of the Netherland cloisters. Here are also two abbeys for monks, two colleges of Jesuits, seven other monasteries, and what is called the Templehof, which belongs to the order of St. John, with twenty-two nunneries, two Beguine-houses, a seminary belonging to the bishopric of Ghent, with several hospitals and chapels.

There are in this city thirteen market-places, seven of which are large, particularly that called the Friday's-market is the most extensive, and remarkable for a noble statue of the emperor Charles V. dressed in his imperial robes, and standing on a pedestal in the middle of the square.

Upon a bridge built over the Lys stand two brass statues, representing a man ready to cut off the head of another. The same figures are also painted in the town-house; the story of which is thus related: A father and son being both condemned to death, a pardon was afterwards offered to either of them that would be the other's executioner. After a long contest, the father prevailed upon the son to save his own life, by taking away his: but just as the son was ready to give the fatal blow, the blade either broke in the air, or flew out of the handle, which being considered as a most singular instance of the interposition of Providence, they were both pardoned.

The town-house is a double building, with two fronts, one of antient architecture, and the other in the modern taste, and very beautiful. It was begun in the year 1600, and was twenty years in finishing. Near this building stands a high tower called the Belfrey, to which is an ascent of above three hundred steps. Here is a fine clock, with a chime of bells, the largest of which, called Rowland, weighs eleven thousand pounds. On the top of this tower is a dragon of gilt copper, said to have been sent from Constantinople by Baldwin IX. earl of Flanders.

The trade of Ghent principally consists in cloths, stuffs, and silks, of which such quantities are made here, that among the fifty companies of tradesmen, those concerned in these commodities are said to form a third part.

The magistracy consists of burgomasters, echevins, or aldermen, and counsellors, annually chosen from among the principal inhabitants; and these have at their head an high-bailiff. This city is the seat of the council of Flanders, from which lies an appeal to the grand council of Mechlin.

In the year 1539 the inhabitants, being over-loaded with taxes, revolted against the emperor Charles V. and implored the assistance of Francis I. king of France; but he refused to comply with their request. Charles,

who was then in Spain, set out immediately, passed thro' France, and having arrived at Ghent, punished the inhabitants with singular severity: he caused twenty-six of the principal citizens to be executed, banished a still greater number, confiscating all their effects; took from the city its artillery, arms, and privileges; condemned the inhabitants to pay a fine of above twelve hundred thousand crowns; sentenced the magistrates to walk in public procession with a rope about their necks; and that the citizens might never be able to recover their former privileges, he built the above-mentioned citadel. By these means he made almost a desert of one of the largest and most populous cities in Europe. But it has since in a great measure recovered its antient splendor, though it is said that not half of its extent within the walls is built upon.

In 1576 the States-general of the Netherlands, except those of Luxemburg and Limburg, concluded the famous treaty called the Pacification of Ghent, the principal articles of which were, that the Spanish, and all other foreign troops, should evacuate the Netherlands; that Holland and Zealand should continue united with the other provinces; and that the Roman catholic religion, and the antient privileges of the country, should be maintained. This treaty was approved and ratified by king Philip II. but with no design to keep it; for the duke of Arschot being appointed governor of the province of Flanders, made a magnificent entry into the city of Ghent, and three days after the citizens assembled, and demanded the restoration of all the privileges they had been deprived of by Charles V. which being refused them, they seized the duke, the bishops of Bruges and Ypres, with some other lords, whom they kept prisoners; after which they took an oath to the prince of Orange, subscribed to the Union of Utrecht, and d'Imbise, who had assisted in this great event, was made first echevin of the city; but in 1584 they again submitted to the king of Spain; upon which d'Imbise was deposed, and soon after publicly beheaded. In 1678 the city was besieged by the French, and the king himself came before it, when, though the citizens cut their dykes, and laid part of the country under water, both the town and citadel were soon taken; but, about four months after, the French restored it to the Spaniards by the treaty of Nimeguen. On the death of Charles II. king of Spain, in the year 1700, the French again seized this city; but in 1706 it surrendered to the allies, after the battle of Ramillies. In 1708 the French surprised it, together with Bruges, and threw an army into it for its defence; but the city of Lisle having been taken by the allies at the close of the same year, the French were obliged to surrender Ghent, after a few days siege. It continued in the possession of the house of Austria till the year 1745, when the French again made themselves masters of it, but restored it to the emperor at the peace of Aix la Chapelle.

The district of Ghent is very considerable, and contains the county of Alost, with its capital; Oudenard, celebrated for the glorious victory obtained near it in 1708, by the duke of Marlborough; the town and castellany of Courtray; the county of Waes; the town and lordship of Dendermonde, and other places.

The city of Bruges, in Latin Bruga, by the Flemings called Brugge, or Bruggen, from a bridge named Bruggstock, near which stood a chapel that gave occasion to the building of the city, is seated in the thirty-first degree sixteen minutes north latitude, and in the third degree fifteen minutes east longitude. Here are several canals, one of which leads to Ostend, Newport, Furnes, and Dunkirk; and can carry vessels of four hundred tons, which come up to the basin of Bruges. The salt-water is kept from mixing with the canal by means of sluices and other machines. Besides this a canal leads to Ghent, another to Damme, and a third to Sluys. These contain stagnant water, though the ground is eighteen feet lower towards the sea than in the town at the Ghent gate: but the water in the city may be soon renewed by letting it run gently into the sea, by means of three sluices. As Bruges has neither rivers nor springs, fresh water is conveyed thither from the rivers Lys and the Scheld, by means of pipes.

The streets of Bruges are large and straight; it has also several fine squares, particularly the Friday's market-place, from whence six great streets lead to the six principal gates. At one end of this square stands a fine steeple five hundred and thirty-three steps high, with a curious chime of bells. This square is planted with several rows of trees.

The square called the Burg, from the castle of that name, is surrounded with many fine buildings, as the town-house, which is a handsome Gothic structure, adorned with the pictures of many earls and countesses of Flanders, the cathedral, the bishop's palace, and the chapel of the Holy blood of our Saviour.

The cathedral is a very antient building, and has thirty-two canons. Here are also two other collegiate churches, one of which is dedicated to Our Lady, and has a chapter composed of a provost and twelve canons; the other is the church of St. Saviour, and has a chapter, consisting of a dean and sixteen canons; the former of these two last structures is very beautiful, and has a fine steeple, so high that it may be seen at sea in sailing to Ostend.

There are here five other parochial churches, fourteen chapels, a college of Jesuits, twelve monasteries, and nineteen nunneries. The pulpit in the Dominican church is esteemed an admirable piece of workmanship; the wood which supports the top is cut out like ropes, and seems to bend like them. Among the pictures there is here shewn a remarkable one of the marriage of our Saviour with St. Catharine of Sienna; the Virgin Mary joins their hands, St. Dominic performs the office of priest, and old king David plays upon the harp at the wedding.

The Carthusians have a large monastery, and the circuit of their kitchen-garden, cells, and little gardens, is about an English mile. All the fathers divert themselves in taking to one trade or other, and convert their cells into workshops.

The Carmelite church is one of the finest in the city, and has a beautiful monument of Henry Jermyn, lord Dover, a peer of England; but the most noble monument in the city is that of the Bernardines. The abbot's apartment is very magnificent, and those of the monks very neat. They keep a sumptuous table, on which is placed every thing in season, and have country-seats depending on the abbey, to which they go a hunting, and even keep their own churches.

Among the many nunneries in this city are two English, one of Augustine nuns, who are all ladies of high rank: these nuns generally entertain strangers at the grate with wine and sweet-meats. The other English nunnery, called the Pelicans, is a stricter order, and the nuns wear a coarser dress.

There are few cities where the poor and orphans are so well taken care of as at Bruges; for here are several alms-houses and hospitals for their maintenance, among which is one called the School of the Orphans, founded in 1411, where a hundred and thirty orphan boys are educated and brought up to learning, or some trade, according to their genius or inclination. They are dressed in cloth coats, half of which is brown and the other half red, and wear flat caps. This school has produced several bishops and abbots, who, to shew their gratitude, have sent their pictures to adorn the school.

Bruges carries on a considerable trade in worked cottons, fine woollen stuffs, linen and lace made here; and here are many persons employed in manufacturing fustians and tapestries. The tradesmen are divided into sixty-eight companies.

About two hundred years ago this city was very flourishing, as merchants from all parts of Europe resorted hither, where the several nations had their distinct houses magnificently built, with ware-houses for the merchandise they either imported or exported. Each nation had also its respective consul, and here are still shewn seventeen antient palaces in which those consuls resided; also the cloth-hall, sayes-hall, and baize-hall, which are spacious rooms that belonged to the English; under the first of these runs a canal of such depth, that it is said bilanders of burthen can enter the very hall.

But the trade of this city at first suffered greatly by the revolt of the inhabitants against the archduke Maximilian, who had married Mary the heiress of the house of Burgundy. The citizens had even the presumption to keep that prince in custody, to affront his servants, and use his officers ill; but when their rebellion had continued about twelve months, dreading the consequences, they implored their sovereign's mercy. This happened in 1490. Fifty or sixty of the inhabitants were, however, sentenced to suffer death, a still greater number was banished, and the city was obliged to pay a large fine.

Ever since the cities of Antwerp and Amsterdam have enlarged their commerce, that of Bruges has been declining; so that it is far from being so populous as formerly. There are still, however, in Bruges several very rich merchants, who meet daily in the great market-place, which has been their exchange ever since the year 1715.

Here are several courts for the administration of justice, both in civil and criminal affairs; the principal is that of the magistrates of Bruges, composed of two burgomasters, twelve echevins, or aldermen, twelve counsellors, six pensioners, and two treasurers. These have the government of the city, and administer justice among the inhabitants.

There is another court for the government of the liberty, which has a magistracy of its own, consisting of four burgomasters, twenty-seven echevins, six pensionaries, and two treasurers. The two last hold their employments for life. This court is held at Bruges in an old castle called the Burg, or Fortrefs. In the hall where they meet are several good pictures, particularly the last judgment, by Backer, a disciple of Rubens.

We are now come to Ypres, or Ipres, in Latin Ipra, which is seated on the little river Ipre, or Iperlee, in the fiftieth degree fifty-seven minutes north latitude, and in the second degree fifty-one minutes east longitude.

The buildings make a pretty handsome appearance, though the fronts are of timber. Its public structures are the cathedral of St. Martin, five parish-churches, one college of Jesuits, six monasteries, one episcopal seminary, eight nunneries, and some hospitals and alms-houses. Here is also a school for poor boys, and another for poor girls, where they are taught what trade they like best; and, when able to get their living, are sent out with a certain sum of money to set them up. One-third part of this town consists of churches, convents, and other religious houses. It is the see of a bishop under the archbishop of Mechlin, and one of the barrier places which was ceded to the States-general in 1715. It has undergone several calamities by fire, and has been frequently taken by the French, particularly in the year 1744, when it was given up by the Dutch garrison almost as soon as the French came before it, together with the territory belonging to the town, which consists of a very fruitful country, containing two or three small towns, and as many villeges.

Ostend, in Latin Ostenda, is called by the Flemings Oostende, and is seated in the fifty-first degree fourteen minutes north latitude, and in the second degree fifty-nine minutes east longitude, in a marshy soil, among a variety of canals; it being almost surrounded by two of the largest of them, into which ships of great burthen may enter with the tide. It is well fortified, and has a strong rampart, a deep ditch, and eight regular bastions; and the sea may be let in round the town for a considerable extent of ground, by which means it is rendered almost impregnable. The city is also defended by several forts which encompass it.

The buildings in Ostend are but low, yet are pretty uniform, and the streets are straight and regular. Its principal church is that of St. Peter, which was burnt down in 1712, and handsomely rebuilt. Here are several convents of friars and nuns, and an hospital founded by the citizens in 1403. The inhabitants labour under want of fresh water, which they are obliged to get from Bruges, whence the brewers fetch it in boats, and lodge it in a large reservoir, near the harbour.

The body of the magistracy is composed of a bailiff, a burgomaster, seven echevins, and a treasurer. They are all changed every year, except the bailiff, whose place is for life.

This city is particularly famous for the long siege it sustained against the Spaniards, from the fifth of July, 1601, to the twenty-second of September, 1604, when it surrendered upon good terms. Its brave defence against the archduke Albert of Austria, and the marquis Ambrose Spinola, may be justly ascribed to the supplies sent from England, and the good conduct of Sir Francis Vere, a native of that country. The Spaniards are said to have lost near eighty thousand men before the place; though, when they first invested it, they did not expect it to hold out a fortnight, which induced the archduchess to make a vow, that she would never shift herself till it was taken. The number who were killed or died during the siege is reckoned at about fifty thousand, not that so many men were in the place at once, but supplies were continually sending from England and Holland. History informs us, that during the first six months the besiegers fired a hundred and sixty-five thousand five hundred cannon-balls of about thirty pounds weight; and that in the whole course of the siege the city had received above three hundred thousand cannon-shot frequently under covert of the dead bodies, with which the besieged filled the breaches. When at last they surrendered, it was neither for want of men nor provisions, the harbour having been open all the time, and supplies constantly coming in, but merely for want of ground, which the enemy had gained foot by foot, till the besieged had not so much left as would contain men enough to defend it. Prince Maurice had several times attempted to relieve it, but to no purpose, the Spaniards being too strongly entrenched, and his army too small to force them. History also mentions this remarkable circumstance, that the Spaniards shot such a number of bullets against the sand-hill bulwark, where they stuck, that it became a wall of iron, and dashed the fresh bullets that hit it to pieces. In short, when the garrison, by virtue of the capitulation, retired to Sluys, prince Maurice received them with as much honour for their brave defence, as if they had come from a conquest. In 1658 cardinal Mazarine attempted to take this city by stratagem, and sent marshal d'Aumont with some men of war to surprise it; but the marshal himself, with the ships, was taken. Upon the death of Charles II. king of Spain, the French seized Ostend; but in 1706, after the battle of Ramillies, the allies besieged and took it from them. During this last siege the town-house, which was a pretty building, was entirely beaten down, with its chime of bells, reckoned the finest in Flanders; but this structure has been rebuilt in a more stately manner.

The late emperor Charles VI. formed a scheme for drawing to this city the trade of the East Indies; for which purpose he established here the famous Ostend company. This scheme was privately encouraged by some English and Dutch merchants; but it made a great noise, and met with a strenuous opposition from the maritime powers, who took some of the ships of that company, while on their return from the Indies; and, after many negotiations, at last, in 1731, caused that company to be abolished. Ostend was also taken by the French in 1745, but restored to the house of Austria by the treaty of Aix la Chapelle in 1748.

We shall conclude this section with a concise description of Nieuport, or Newport, which stands about nine miles from Ostend, and is a strong sea-port town on the little river Iperlee. Its harbour is secure; but only ships of middling burthen can enter it even at high-tide, when it has about thirteen feet water. Though this city be pretty well fortified, yet its principal strength consists in its sluices, by means of which all the adjacent country may in a minute be laid under water. The streets are wide and straight, but the houses are low and built with timber. It has but one parish-church, which is reckoned the finest in all Flanders, besides several convents, a noble hospital for the support of forty orphans, and a convent of English Carthusian friars. The inhabitants chiefly support themselves by fishing and making nets and cordage for ships.

In the year 1600 a battle was fought near this town between the forces of the United Provinces, commanded by prince Maurice of Nassau, and the Spaniards, to the disadvantage of the latter; and in 1745 it was taken by the French.

S E C T. V.

Of the Austrian Part of the County of HAINAULT.

Its Situation, Extent, Produce, Rivers, and Divisions of the Country; with a Description of the City of Mons.

THE Austrian part of the county of Hainault, called by the Germans Hennegau, is bounded on the north by Flanders; on the east by the dutchy of Brabant, the county of Namur, and the bishopric of Liege; on the south by Champagne and Picardy; and on the west by Artois and Flanders; extending fifty-seven miles from north to south, and about sixty-four from east to west.

The air is good and moderate, and the soil produces a great deal of corn and rich pastures, on which are bred a great number of cattle. Its woods and forests afford timber for building and fuel: it has also pit-coal, iron, beautiful marble, and slates.

Its principal rivers are the Scheld, which issues out of Picardy; the Selle, which receives into it the Hayne and the Haunia; the Sambre, which issues out of Picardy; and the Dender, which rises here, and runs into Flanders.

In the whole country are reckoned twenty-four towns; the number of villages is by some computed at nine hundred and fifty, but by others only at six hundred and fourteen. The clergy are uncommonly rich, and in this county are sixteen abbies for monks, and ten for nuns, together with twelve chapters, and many monasteries and convents.

The states of this country consist of three chambers: to the first belong the clergy, to the second the antient genuine nobility, and to the third the deputies of the towns: each chamber has only one voice; and the plenipotentiaries of each have their seat at Mons. Both the clergy and the nobility have two plenipotentiaries, whose office lasts three years; but the towns have six. The sovereign also sends two deputies. All these meet weekly; but the states only at the command of the sovereign.

By the peace of the Pyrenees France obtained the towns of Landrecy, Quesnoy, Avesnes, Marienburg, and Philipeville; as also by the peace of Nimeguen, Valenciennes, Bouchain, Condé, Cambray, Bavay, and Maubeuge, with their respective districts; and by the peace of Ryswick, several villages. The house of Austria still enjoys in this county thirteen small towns, with several principalities and some villages. The principal place in this county is,

Mons, a very large, fine, strong, and rich city, the capital of Hainault, is called by the Flemings Bergen, and in Latin Montes; it is seated on a hill near the junction of the rivers Haine and Trouille, and is also partly built in the plain, in the fiftieth degree thirty minutes north latitude, and in the third degree thirty-six minutes east longitude. The little river Trouille divides it into two parts, and fills its three ditches; after which it runs into the Haine. Here are sluices by which the neighbouring country may be overflowed, except the south-east side, where the ground being somewhat higher, they have raised good bastions, which render the approaches of an enemy very difficult. The city contains above four thousand six hundred houses. The buildings are beautiful, the streets large, the market-place spacious, and the public edifices are very magnificent. Among the last is the governor's palace, in which the provincial council meets, and the town-house, which has a lofty tower.

This city contains six parish-churches, two of which are collegiate, one college of Jesuits, and several cloisters. Here is a famous abbey, or chapter, of canoneses, founded by St. Waltrude. The chapter consists of thirteen canoneses, who it is said must prove their nobility by sixteen descents. They are obliged to assist at morning-service in their canonical habits; but the rest of the day may

may wear sumptuous apparel, and even spend their time in dancing, singing, and free conversation; they are even permitted to leave the abbey and marry. This chapter is governed by four of the oldest canonessees. Their church is a very fine structure, most of its chapels and altars being built with marble and jasper, and adorned with beautiful statues. This is also a parish-church, to which the nobility, magistracy, counsellors, and officers of state belong.

Here is also a college where polite literature is taught under the direction of secular priests, and likewise a Jesuits college.

The body of the magistracy consists of a mayor and ten echevins, &c. and as this is a place of strength, it has a particular governor, with other proper officers both civil and military. It has a good trade for various commodities, especially woollen stuffs, great quantities of which are made here.

This city has frequently suffered the dreadful calamities of war. In May 1572 count Lewis of Nassau, brother to the prince of Orange, took it by stratagem without opposition; but Frederic of Toledo, the duke of Alva's son, besieged it in June following, and took it in September, notwithstanding all the endeavours of the prince of Orange to relieve the place. In 1677 marshal d'Humieres, who commanded the French, invested Mons, and had greatly distressed that city; when the next year the prince of Orange, afterwards king William III. advanced to its relief with thirty thousand men, and attacked by surprize the French army under the duke of Luxemburg, who was encamped at Castiaux and St. Denys, in order to cover the blockade; the battle became exceeding bloody, and the prince obtained the advantage. The next day the blockade was raised, and hostilities ceased, upon the prince's acquainting the duke, that the peace had been signed at Nimuegen.

The French again invested this place in 1691, when Lewis XIV. was there in person, with all the princes of the blood, and marshal Luxemburg commanded the army of observation. The trenches were opened on the twenty-fourth of March, and the city obliged to surrender on the ninth of April following, most of the houses having been beaten down by the besiegers bombs: but the city was restored to the Spaniards by the treaty of Ryswick in 1697.

Upon the death of Charles II. king of Spain, the French again seized this city, and kept possession of it till the year 1709, when it was invested by the duke of Marlborough. The grand army under the marshals Villars and Boufflers, threatening to relieve the place, the duke advanced to give them battle, and came up with them in the woods near the village of Malplaquet, about seven or eight miles to the south of Mons: though the French lay under triple intrenchments, he boldly attacked them, and gave them an entire defeat; but with considerable loss on the side of the allies: after which immediately followed the reduction of this city and the province of Hainault, which was confirmed to the house of Austria by the treaty of Utrecht in 1713, and made a part of the barrier. The French under marshal count Saxe again took this city in 1746, but restored it by the peace of Aix la Chapelle in 1748, after first demolishing its fortifications.

In the county of Hainault are also thirteen small towns, and several villages; and among the latter is Malplaquet, rendered famous by the above victory obtained by the duke of Marlborough over the French, and also Steenkirk, near which the allies, commanded by king William III. attacked the fortified camp of the French in 1692: the French lost more men than the confederates; and were it not for the conduct and bravery of the prince of Conti, would have been entirely defeated.

S E C T. VI.

Of the County of NAMUR.

Its Situation, Extent, and Produce: the Arms and States of the Country; with a particular Description of Namur, its Capital, and also an Account of the Barrier Towns.

THE county of Namur is almost surrounded by the bishopric of Liege and the dutchy of Brabant; but

terminates also to the west on the county of Hainault. Its greatest extent from east to west amounts to about thirty-one miles, and from north to south to about twenty-eight. This county is very woody and mountainous; but the level parts bear all sorts of corn. Its principal riches, however, consist in its iron, great quantities of which are worked here, and converted into steel. It has also lead and pit-coal, with a great deal of marble and other stone. The Maese traverses a great part of the county, and at Namur receives into it the Sambre.

The arms of the county are, a lion sable in a field or, with a dexter fesse drawn over the whole shield.

The states of Namur consist of the clergy, the nobility, and the principal town of Namur, with its territory. The sovereign appoints the governor of that city and county.

Namur, or Namen, in Latin Namurum, the capital of the county, is seated between two hills at the confluence of the Sambre, the rivulet of Vederin, and the river Maese; and is defended by a very strong castle, situated on a rock between the Maese and the Sambre, near their junction. This castle is likewise defended by Fort William, built by order of king William III. by the famous Coehorn. This fort is equivalent to another citadel; and besides these there are said to be above twelve other forts round the city, the most considerable of which is that of the Maese, opposite to the castle, and the fort of Cocquelet, which is so large that it includes two villages within its fortifications. Namur, from the above works, is esteemed the strongest fortress in Europe. It has two stone bridges, one over the rivulet of Vederin, and the other over the Sambre.

This city is the see of a bishop, who is suffragan to Cambray; and, besides the cathedral church of St. Albin, the chapter of which is composed of twenty canons, here are two collegiate churches, four under parish-churches, a seminary, thirteen convents of both sexes, and a college of Jesuits, who teach philosophy, and whose church is a noble building, all of red and black marble, supported by ten large columns of black marble, and adorned with a beautiful frontispiece. The prince's palace is a fine square building, in which the governor usually resides. Here are likewise several hospitals.

The magistracy consists of a grand mayor, who enjoys his place for life, of a burgomaster, and six echevins, who are all changed every year by the governor-general. Here is another tribunal called the sovereign bailliage, composed of six advocates, with the governor at their head. These judge in all feudal cases; but an appeal lies to the grand council at Mechlin.

In the year 1692 Lewis XIV. besieged this city in person, when, after opening the trenches, it held out only six days; but in 1695 was retaken by king William III. after a most bloody siege: marshal Boufflers commanded in the town with a garrison of no less than sixteen thousand men, and Villeroy without at the head of a hundred thousand; but did not dare to attempt its relief. Besides the marshal, there were several general officers, and twenty engineers in the city; and the garrison fought so desperately, that when the city was taken no more than four thousand men were left. Upon the death of Charles II. king of Spain, the French seized this city, and held it during queen Anne's wars; but at the peace of Utrecht it was restored to the house of Austria. In 1712 it was ceded by king Philip to the elector of Bavaria, and in 1715 was given to the States-general as a barrier town to be garrisoned by them; but in 1746 the French again made themselves masters of it, and kept it till the peace of Aix la Chapelle.

Within the county of Namur are Charleroi, Walcourt, and Bouvigne, with a great number of abbeys and priories of both sexes, and a number of little districts under the name of signories.

Before we conclude this account of the Austrian Netherlands, it will be proper to take some notice of the barrier towns so often mentioned. It must be observed, that by the barrier treaty concluded in 1715, between the emperor and the States General, the former consented that the latter should alone garrison Namur, Tournay, Ypres, and several other places, either with their own troops, or with such as the emperor had no reason to suspect.

suspect. The emperor was to nominate the governors, but both they and the garrison also take an oath of fidelity to the States. The emperor and States General are at their own expence to keep on foot between thirty and thirty-five thousand men for the security of the Austrian Netherlands; the former paying three-fifths, and the latter two-fifths. In case the former diminished his quota, the latter might do so in the like proportion; but on the appearance of a war, this body is to be augmented to forty thousand men; and in case of an actual war, the augmentation to be increased at pleasure. The States have the distribution of the troops in the several places committed to them; but in the others such distribution is to be made according to the joint consent of both parties. In those places garrisoned only by Dutch troops the States General appoint the governors, commandants, and staff-officers, on condition that their lodgings, and the advantages arising from the works, shall not be productive of any charge either to the emperor, or to the provinces, nor unacceptable to the emperor from particular causes. These officers are to defend the places entrusted to them, and in their military capacity are only subject to the States, though they take an oath to the emperor to

hold and maintain them for the house of Austria. The troops of the States-general, when in garrison, are permitted the free exercise of their religion. The States General may change the garrisons at pleasure, and in time of war strengthen the fortifications, but not raise any additional works, without the approbation of the Austrian governor-general of the Netherlands. For the support of these garrisons, and defraying the expences of the fortifications, military stores, and provisions in the barrier-towns, the States are to pay the annual sum of five hundred thousand rixdollars; for which purpose an office has been established at Ypres, under the title of The Barrier-office, and this, exclusive of the revehues issuing from their share in the upper quarter of Guelderland, the quartering-money, &c. During the war which was terminated in 1748 by the peace of Aix la Chapelle, these barrier towns were greatly damaged; and since that time many difficulties have arisen relating to them, between the court of Vienna and the States General; and it is said that the Dutch troops at present in them do not exceed nine battalions and two squadrons, and possibly the right of garrisoning them may in time become obsolete, and be superseded.

CHAP. XXI.

Of the UNITED NETHERLANDS.

SECT. I.

Their Situation, Extent, and Climate: the Diseases of the Inhabitants; the Dykes, Dams, and Canals necessary to exclude the Sea, drain the Lands, and promote Commerce. The Produce of the Country, its Rivers, and Fisheries.

THE name of Netherlands, or Low Countries, by which all the seventeen provinces are called, is doubtless derived from the low situation of those countries; the inhabitants themselves call the country Belgium; but the French, like most other nations, stile it Les Pais Bas, or the Low Countries. This tract lies between Germany and France, and its greatest length, as taken north-east along the side of the ocean, is about three hundred miles, and about a hundred and forty on the south side.

The seven United Provinces, of which we are here to treat, form only the northern part of this tract, which borders to the south on Austrian Flanders and Brabant, just described; to the east on the upper quarters of the dutchies of Guelders and Cleve, the bishopric of Munster, the county of Bentheim, and the principality of East Friesland; and to the north and west on the Northern sea. The seven United Provinces, notwithstanding the figure the Dutch made, and still make in Europe, is no more than a hundred and fifty miles in length, and a hundred in breadth.

The whole country is full of marshes, which are not without their advantages, as they yield good turf for fuel, and in some parts of the provinces of Groningen, Overijssel, and Drenthe, they are esteemed so secure a fence against Germany, that draining them in order for cultivation is prohibited by law, though this prohibition is not universally regarded.

But these morasses, joined to the low situation of the country near the sea, occasion a damp air, and frequent rains, which, as well as the thick fogs, are more particularly brought on by the westerly winds, that prevail in these parts with great violence. The general distempers of the inhabitants are the gout and scurvy. Coughs and rheums are also very common here; and in the fenny parts near the sea, where the mud, during the ebb, emits putrid effluvias, and wholesome water is scarce, continual reachings are likewise very frequent.

As the land is for the most part level, and in many places lies even lower than the sea, it is not only fenced

against any inundations from the ocean and the rivers at a prodigious expence, by dykes and dams, but for the draining of the waters innumerable ditches are cut; whence the waters so drained are carried off by windmills, and conveyed into canals, from whence it is forwarded by means of sluices into the rivers. These dykes, ditches, and canals, give the country a singular appearance, and by being planted with beautiful rows of trees, interspersed with villas and gardens, are of infinite convenience to merchants and travellers. The treckshuyts, or barks, which are drawn here by horses, go off every day during summer, and at certain stated times pass from one place to another.

As a great part of the soil consists of heath and sandy downs, it is far from affording a sufficient support to the inhabitants, nor can all their industry used in agriculture, draw from it as much grain as is necessary for home consumption. But this is so amply compensated by its trade and navigation, that of the imported grain they not only brew good beer, and distil brandy with other spirits, but export great quantities of both. On the other hand, its rich meadows and pastures render grazing very profitable, and the inhabitants are not only supplied in abundance with milk, butter, and cheese; but the exports of the two last are very considerable, the cheese of Edam and Texel being famous all over the world. In Holland the breeding of sheep is carried on with great success, and admits of still farther improvement, it appearing on an estimate, that under proper regulations, a million of sheep might be fed in that province. The wool of these sheep is reckoned extremely good. Several places yield tobacco, and Zealand is noted for its madder. These provinces have likewise a sufficiency of culinary plants, and some parts abound also in fruit. The principal fuel here is turf and pit-coal, the latter of which is imported from England and Scotland; for wood being very scarce, and bearing a great price, is little used: every piece of timber wrought in these countries, whether for building or exportation, is brought from abroad. Many places make salt from seawater. The county of Zutphen yields iron: but in general the inhabitants owe both the necessities and comforts of life to their extensive commerce with foreign countries.

The provinces of Zealand, Holland, Friesland, and Groningen, lie contiguous to the North Sea, while those of Utrecht, Guelderland, and Overijssel, have a communication

munication with it by the Zuyder-Zee or South-Sea; which is a large lake or bay environed by the provinces of Holland, Utrecht, Guelderland, Overysfel, and Friesland. The principal rivers are the Rhine, the Maefe, and the Scheld.

The fishery in the several streams, rivers, and lakes of this country, though very considerable, serves only for home consumption; but that of the North Sea is of vast produce, and divided into the Lesser and Greater. The former is that carried on along the coast, especially on the Doggersbank, between England and Jutland, on which are caught cod, haddock, turbot, whittings, soles, and other sea-fish. The cod caught here is either carried fresh and alive to market to the nearest towns of the Netherlands, or is salted at sea, and thus forms a branch both of domestic and foreign commerce. The great fishery is that of herrings, from which the Dutch reap immense profits: for if it may not, as formerly, be termed the golden mine of Holland, yet it still affords a comfortable subsistence to at least thirty thousand six hundred families. The season for catching the herrings along the coasts of Scotland and England, is from the twenty-fourth of June to the twenty-fifth of November. The vessels employed in this fishery are termed *busses*, and carry from twenty-five to thirty lasts, which one with another sell for about one hundred and twenty guilders. Formerly in some years no less than fifteen hundred such vessels have sailed from the ports of the seven provinces; but at present it is said that the number of them seldom exceeds two hundred. Though the estimates of the profits arising from the herring-fishery differ, as the profits themselves really do, very widely, yet it is computed that in a good year the neat gain to the proprietors of the *busses*, after all deductions, amounts to two millions of Holland guilders; a very considerable sum, which might perhaps have been gained by the inhabitants of Great-Britain, had the Dutch been steadily and constantly refused the privilege of fishing on our coast, and seizing those advantages which properly and naturally belong to ourselves.

S E C T. II.

Of the Manners of the Dutch, the Populousness of the Country, with a general Account of their Towns and Villages, their Language, and the Religions tolerated there. The Skill of the Dutch in the polite Arts, their Learning, Manufactures, Trade, Commerce, and Coins.

THE Dutch are robust, laborious, patient, free, open, affable, and pleasant in conversation. They are great politicians, not excepting the women and servants, and the very children are well acquainted with the history of their country. However, the boors, and especially the sailors, are rude and clownish. Mr. Hanway observes, that he has seen a boatman in a great city, strut up and down a room with his hat on, his hands on his hips, and with a careless air of insolence, spit at the feet of a gentleman who was treating him with civility, and giving him an opportunity of getting a guinea for an inconsiderable service. This they mistake for liberty, while their knowledge is confined to the common means of gain, and the gratifications of the calls of nature. Cheese, beer, geneva, brandy, and tobacco, are the joys that seem to crown the labours of the common people. The principal virtue of this nation is frugality; they are at all times contented with moderate meals, and the common people never make extravagant feasts. Very often a biscuit, with a bit of butter, cheese, or a herring, with a glass of beer or brandy, suffices them for a repast; but in their cups they are apt to mix cruelty with their rusticity. Indeed a Dutchman is naturally phlegmatic and slow to anger; but when he is heated, he is not easily appeased. Constant employment, coldness of complexion, and perhaps the nature of their food, may contribute to their being but little addicted to love.

The women who are not of high rank adorn their heads with gold lace, and other of the like ornaments, but with more frugality than is generally practised in

Germany. Except a few court ladies, they have not much taste or delicacy in their manners. They are generally handy, neat in their houses to excess, well made, and some have good complexions; but there are few beautiful: their teeth are in general bad, and most of their children are sickly till the age of eight or ten. The women in this country seldom breed after they are thirty; and as the men are remarkable for wearing many breeches, the women in cold weather use pots with live coals of wood or turf set into boxes bored full of holes, and put under the petticoats: this is not only apt to make them old from the waist downward, before the time ordained by nature; but the smell of the coals is offensive. Thus there is a proverbial saying, that "The dirtiest piece of furniture in the house of a Dutchman is his wife." But we would not be understood to charge the disagreeable part of this character on every individual of that nation; there are no doubt ladies distinguished by their charms, and their delicacy. Beauty is not confined to particular nations; and the polite and well-bred are to be found in every country in Europe.

The very situation and nature of the country render industry more necessary there than among the people of other nations. The neighbourhood of a dreadful volcano, says an ingenious author, cannot render the situation of the inhabitants of any other place more precarious than that of the Dutch, from the lowness of the land; for here the ocean has often passed its bounds, and exhibited a lively picture of the general deluge. In 1530, a great part of the country, with seventy-two villages on the coast of Holland and Friesland, were swallowed up, and near twenty thousand people perished; and in 1665, an inundation broke down the dyke of Muydenburg, and laid many places in the province of Utrecht under water. The dyke between Amsterdam and Harlem, and many others were also broke: but the calamity was no sooner over, than the industrious inhabitants, as soon as possible, repaired the damage. With respect to their dykes, they have lately made great improvements: they now line many of their shores with large stones. The dyke to the Zuyder Sea is raised about sixteen feet perpendicular, and goes off upon an easy slope. The stones are here regularly laid, and form an excellent defence against the water; but the dykes toward the North Sea are said to be more lofty, and not to be supported but with piles at a great expence.

The United Provinces, though formerly a bog, are well cultivated, and extremely populous; for these, with the country of Drenthe, contain no less than one hundred and thirteen cities and towns, together with fourteen hundred villages, some of which are very considerable; and there are here about two millions of inhabitants, exclusive of those of twenty-five towns in the conquered lands. But the most populous and best improved of all the seven provinces is that of Holland. The towns here, in the form of the houses, in the canals cut through the streets, and planted with trees, as also in the cleanliness of the streets themselves, make a more agreeable appearance than is usually seen in other countries; and for the villages, no part of the globe can be compared with North Holland.

The language spoken here is Dutch, which is a dialect of the Low German; but so different from the German tongue, that those who only understand that, find the Dutch unintelligible. The French is also much used, and is generally understood; so that most of the news-papers and books are printed in that language.

At the time of the Reformation the inhabitants declared for Lutheranism, adhering only to the Augsburg confession; but in 1562, a different system of articles, corresponding with those of Geneva, was drawn up for the Netherland churches; at the union of Utrecht in 1579, the States agreed to maintain and defend it; and in 1651, the Calvinist doctrines, as set forth by the synod of Dort, received the sanction of the states of each particular province. Hence the Calvinists alone are admitted to any share of the government, and deemed capable of holding the principal employments. The number of Calvinist ministers in the seven United Provinces, and the countries belonging to them, amount to one thousand

thousand five hundred and seventy. However, respect is paid to the rights of conscience, an universal toleration being allowed.

The popish churches in the United Provinces amount to about three hundred and fifty, and the priests to near four hundred; of these fifty-one churches and seventy-four priests are Jansenists, and the rest are of Jesuitical principles, or adhere to the constitution Unigenitus. The papists are admitted only to military employments; but no person of that sect is ever created field-marshal. They are computed to make one-third of the inhabitants; the Jesuits, however, are not tolerated, though in some places connived at.

The Lutherans are allowed the free exercise of their religion in the towns, and their places of worship, in the outward architecture, have all the appearance of churches. The Lutherans are, however, incapable of all posts and employments. In the United Provinces and Brabant are forty Lutheran congregations, who have fifty-two fixed ministers. The Saltzburghers have also a congregation in the district of Cadfand.

The Remonstrants, so called from a remonstrance which they presented to the assembly of the states in 1610, are also called Arminians, from the learned Jacob Arminius, who taught the doctrine of universal redemption. These are at present tolerated; but instead of increasing, are rather under a decline. Of this society there are thirty-four congregations, under forty-three ministers, in Holland, Guelderland, Utrecht, and Friesland. These every year hold a general assembly at Amsterdam and Rotterdam.

The Mennonites or Baptists are divided into various sects, the principal of which are the Flemischers and Wasserlanders. In many places these several congregations are incorporated with each other. The Baptist congregations throughout all the Netherlands do not exceed one hundred and eighty-six, and their ministers amount to about three hundred and twelve.

The Rheinburgers, or Collegiants, obtained the first of these appellations from Rheinburg, a village near Leyden, where they meet twice a year to celebrate the eucharist; the second title had its rise from the colleges, or particular assemblies, they have established in several places, to the number of about eighteen or twenty.

The Quakers are at present dwindled to a very small number; but the Moravians form a considerable body. The Armenian Christians, who in many respects resemble those of the Greek church, chiefly reside at Amsterdam, and also enjoy the free exercise of their religion. There are many other sects that have no settled congregations. The Jews have been allowed the public exercise of their religion ever since the year 1619, and with respect to many rights and privileges, are on a footing with the other inhabitants, except their being excluded from most trades at Amsterdam and some other places. They are divided into Portuguese and Germans, the former of whom came from Portugal in great numbers, in the years 1530 and 1550, and were very kindly received.

With respect to the fine arts, the Dutch have chiefly distinguished themselves in painting and engraving, though they are not without skilful statuaries. For some centuries past, the sciences have been cultivated among them with great application and encouragement, and the number of persons eminent for knowledge and literature, who were either natives of the Netherlands, or invited hither, is very considerable. There are no less than five universities in this country, namely, Leyden, Utrecht, Harderwyck, Franeker, and Groningen, with two gymnasiums, one at Amsterdam, and another at Deventer. There are likewise several famous grammar schools, and in Harlem is an academy of sciences.

The United Provinces being so populous and well improved is chiefly owing to the variety of manufactures carried on there, and to the amazing extent of their commerce. Among the former are the beautiful tiles, of which immense quantities are made in South Holland and Utrecht; their small bricks, called klinkers, great numbers of which are exported; their potters-ware, and tobacco-pipes, particularly those of Tergow; with the Delft porcelain, great quantities of which are also carried

to foreign countries. Good borax is also made in Holland, and common salt well refined. Here are likewise a multitude of oil mills, and starch both blue and white furnishes employment for a number of hands. Great quantities of thread spun in Germany are imported both bleached and unbleached into the Netherlands, where it undergoes farther improvements, and is used either for laces or linen; but the finest linen is made in the province of Friesland, and the Holland damask is not to be exceeded. A great deal of German linen is also bleached and whitened by the Dutch. Hemp is likewise manufactured here several ways: and with respect to paper, immense quantities of it are made, and the best sort is acknowledged to be as fine and beautiful as any in Europe. The timber brought from Norway and the Baltic, is sawed by mills for the building of ships and houses; and besides being a very profitable article in their exports to Spain, Portugal, and other countries, is made use of by the Dutch for the construction of large ships for many European nations; and for making a vast variety of toys, which are exported to foreign countries. Sugar-baking is also the source of a great trade. The woollen, cotton, and silk manufactures do not want beauty; but are at present on the decline; good leather is also made in the United Provinces, and some places are particularly remarkable for the bleaching of wax.

The great trade of these provinces is facilitated and supported by means both natural and political, as by their situation along the German ocean, though without any convenient or safe harbour; the Zuyder Sea, the navigable rivers, and multitude of canals; their civil and religious freedom, with the number, skill, and industry of the inhabitants in handicrafts, manufactures, and fisheries; the great multitude of their merchant ships, the plenty of specie, their national parsimony, and eagerness of gain; their credit among foreigners, the bank at Amsterdam, and their East India trade. By their commerce and shipping this little republic has been able to support many wars, and still maintains its freedom; but both the commerce and power of the Dutch have constantly gone hand in hand, rising and falling together: that their trade and power have for some time past been under a decline is very evident, and this by some is imputed to a decline of parsimony and industry among the inhabitants; but the principal cause is probably the improvement of manufactures, traffic, and navigation, in some of the neighbouring nations. It is still, however, very considerable, though its principal dependence is on the East India company, whose power and riches are too great to be conceived, and of which the reader may see an account in vol. I. page 116, &c.

The Dutch trade almost to every country and port, either as carriers, or in exporting goods, and bringing home returns on their own account: their most considerable exports are goods brought to Holland in their East and West India ships, and among those chiefly spices. Their trade to the Mediterranean and the Levant is conducted by a company; they also carry on a great trade to Spain; their trade to Portugal is very advantageous, but in that to France the imports exceed their exports. The commerce of the States with Great Britain and Ireland is very much curtailed by the strict prohibitions made by the English against the importation of certain commodities, and by the heavy duties laid on others. Another very considerable branch of their trade is that to Norway, Denmark, Russia, and the other countries lying on the Baltic. Their trade to Germany and the neighbouring countries is carried on along the Elbe, the Weser, the Rhine, the Maese, and the Ems; but Hamburg is the port most frequented by them. Their traffic with the divided Netherlands daily decreases.

The coinage of the United Provinces is under the direction of a general mint-college. Indeed every province being a sovereignty of itself, each of course has the privilege of coining; but all pieces, in order to obtain a general currency through the whole republic, are obliged to be of the same intrinsic value; without which regulation one province would not fail to cry down such pieces of the others as happened to come short of the due weight. The smallest piece here is named a deut, or dite,

dite, is worth about half a farthing ; a grot Flemish is four dites, and a stiver two grots ; two stivers make a small silver piece called dubbelchen, and a schilling is equivalent to six stivers. There are also lowered schillings of five stivers and a half ; and festehalves, which are of the same value ; the eight and fourteen stiver pieces, are not very common. A Holland guilder is equivalent to twenty stivers, or one shilling and eight-pence. There are likewise half guilder and three guilder pieces ; but these are seldom seen. A gold gulden makes two twenty-eight stivers, and a thaler, or dollar, thirty ; a rixdollar, or Albert dollar, is two guilders ten stivers. There are also half and quarter rixdollars ; a lion dollar is worth forty-two stivers, or three shillings and seven-pence ; and a ducatoon is worth sixty-three, or five shillings and two-pence. Their gold coins are the well known ducats, which are worth five Holland guilders, and four or five-pence ; and whole ruydders are worth fourteen guilders.

S E C T. III.

A concise History of the United Provinces ; their political Constitution, with a particular Account of the States General. The Titles and Arms of the States ; the Taxes and Revenues of the Republic ; with their Military and Naval Force.

THE Netherlands, with that part of Germany which lies west of the Rhine, was possessed by the Romans, who called it Gallia Belgica : but upon the decline of the Roman empire, the Goths, and other northern people, took possession of these provinces, as they passed through them in their way to France and Spain : and here erected several small governments that were a kind of limited monarchies, whose sovereigns were stiled dukes, counts, and lords. The people enjoyed great privileges under these princes, who were contented with preserving them, because the smallness of their respective dominions made their greatest strength consist in the affection of their subjects. But afterwards when all these provinces became subject to one prince, who had large dominions elsewhere, the people were treated with less indulgence. Charles V. was the first of these, and, as he was king of Spain, emperor of Germany, and duke of Burgundy, he had different interests from those of his predecessors ; and being engaged in a war with France, he brought foreign forces from his other dominions into the Netherlands, notwithstanding the laws to the contrary.

At length the reformation breaking out, that prince exhibited very rigorous edicts against those who separated from the Romish church ; and Grotius affirms, that, during his reign, above a hundred thousand persons suffered death for their religion ; but the number and courage of those who embraced the doctrines of the reformation, instead of being diminished by the horrors of persecution, daily increased, and sometimes the people rescued out of the hands of the officers those who were led to execution. Thus the Netherlands became extremely alienated from the house of Austria, and their discontents increased on Charles's nominating his son Philip II. to be their governor. This prince would admit only of the Popish religion ; and a sanguinary persecution against the heretics, as they were called, was carried on with fresh vigour, a court of inquisition was erected, and these cruelties aggravated by insupportable taxes.

These oppressions being carried to the most tyrannical height by Ferdinand of Toledo, duke of Alba, whom Philip had created governor, the Netherlands made a push for their freedom, and William prince of Orange, in conjunction with his brother, count Lewis of Nassau, undertook the defence of the inhabitants, in their noble struggles for religious and civil liberty. Accordingly the states of Holland, in their own names, conferred the stadtholdership on the former, and several other towns and provinces declaring for him, he at first united them, in 1576, in one general association, under the title of The Pacification of Ghent. But this union being soon dissolved, the prince laboured to the utmost of his power

to form a more durable alliance, which he happily accomplished in 1579. In that year the celebrated league of Utrecht was concluded, which gave name to the United Provinces, and became the basis and plan of their constitution. The prince of Orange was afterwards on the point of being nominated sovereign of these countries, but was treacherously shot in 1584, by an assassin hired by the Spanish ministry. The United Netherlands, however, continuing to maintain, sword in hand, that liberty to which they had raised themselves, queen Elizabeth of England took them under her protection, and sent them assistance. Thus the war went on prosperously, and their commerce arrived at such a pitch, that in 1602 their celebrated East India company was established, and Spain being both weakened and discouraged by the ill success of a tedious war, in 1606, agreed to an armistice for twelve years, and in the very first article acknowledged the United Netherlands to be a free and independent state ; and, during this truce, the republic attained to a degree of power which it has never since exceeded.

In 1621 the war was again renewed, during which the stadtholder, prince Frederic Henry, greatly distinguished himself. This war was brought to a period in 1648, by the peace of Munster, at which Philip IV. king of Spain, renounced all claim to the United Netherlands.

In 1652 a war broke out between the United Provinces and England ; but was terminated two years after by a treaty, in which the states of Holland engaged for ever to exclude the house of Orange from the stadtholdership of their province.

In 1665 another war was kindled with England, which lasted till the treaty of Breda. The states of Holland and West Friesland then passed an edict, by which they abolished the stadtholdership in their province. When France formed a design to seize on the Spanish Netherlands, the United Provinces entered into an alliance with the crowns of England and Sweden, for the defence of those countries : thus France was, in 1668, compelled to agree to the peace of Aix la Chapelle ; but soon took a severe revenge by subverting that alliance, and inducing England, with some other powers, to enter into a league against the United Provinces, on which a war ensued. In this critical juncture the republic, in 1672, nominated the young prince of Orange, named William III. captain and admiral-general ; and the populace compelled the states of Holland to invest him with the stadtholdership, which two years after was declared hereditary.

In 1678 a peace was concluded with France at Nimeguen ; but it was of no long continuance, for in 1688, the states supporting their stadtholder in his expedition to England, with a fleet and a large body of troops, France declared war against them, which lasted till the peace of Ryswic in 1697. At length, on the death of Charles II. king of Spain, in the year 1700, the Spanish provinces fell to the share of the house of Austria, and the republic became involved in a war relating to that succession, which continued till the peace of Utrecht, in 1713. On the decease of the emperor Charles VI. they assisted the queen of Hungary against France, which drew on them the resentment of that power ; and, in 1747, the French making an irruption into Dutch Flanders, the republic unanimously declared the late prince of Orange hereditary stadtholder, captain-general, and admiral in chief.

The Seven United Provinces form seven republics, or independent sovereign states, united together for their common defence in a close alliance ; but on condition, that all shall enjoy their own respective laws, liberties, and privileges. As they are confederated and allied together, it is requisite that they should meet, in order to consult on the most proper method of promoting their common interest ; but as it is impossible for all the members of these several states to meet together, each particular state appoints some person to represent it ; and the assembly of these representatives is called the assembly of the States-general.

Not only each province, but the principal cities, send deputies to the States-general, as do also the nobles. Thus the number of the representatives is very considerable, and all are maintained at the expence of their respective provinces ;

provinces; the deputies of Holland being allowed four florins a day, and those of the other states six. But whatever be the number of the deputies from each province, be they nobles or commoners, they have all together but one voice; and therefore in the assembly of the States-general there are but seven voices. Besides this, being properly the assembly of the representatives of the seven sovereignties which compose the states of the United Provinces, their power is limited either expressly or tacitly by this instruction: "Not to suffer the least wound to be given to the sovereignty of that province which deputes them."

The States-general, however, not only make peace or war in their own name, but send and receive ambassadors and other public ministers. The commander in chief, and all other military officers, take an oath of fidelity to them; and, during a war, some of their members, or of the council of state, follow the army, sit in the council of war, and without their consent nothing of importance can be undertaken. In time of war the States likewise grant licences and protections.

Thus the States-general appear at first view to be the sovereigns of the country; but most of these deputies are appointed only for a few years, and though they have the power of debating on the most important affairs that may tend to secure or promote the preservation and happiness of the state, yet they have not power to conclude any point of great consequence, without previously communicating it to their respective provinces, and receiving their express consent. This renders the resolutions of the republic so tedious and dilatory, as to tire the patience of those powers who have affairs to negotiate with the states; but tho' this slow method of proceeding be attended with many inconveniences, it has some advantages: it affords leisure for mature deliberation and caution, and is sometimes an unexceptionable pretence for protracting time and waiting events.

In the assembly of the States-general, the provinces preside weekly in their turn, beginning with Guelderland, who had the precedence before the union; then Holland, Zealand, Utrecht, Friesland, Overijssel, and Groningen. He who is first named in the deputation of his province presides, and is from hence called the President of the Week. He proposes the subject to be debated, and collects the votes of the assembly, upon which he forms his conclusion, dictates to the register, and afterwards signs the resolution. They sit throughout the whole year without adjournment, and their meetings are always held at the Hague.

The highest office in this country is that of stadtholder; for he is at the same time governor-general of the seven United Provinces, captain-general, and grand-admiral; but his power is extremely limited. He swears to obey the States-general, and can neither make peace nor war without their consent. He may come to their assembly to lay before them any business in which the public is concerned; but has not ordinarily a seat in it. He may pardon criminals condemned to suffer death, and has the right of choosing the magistrates of cities upon a double nomination of their respective senates, excepting only Amsterdam, with several other important privileges.

The title assumed by the States is that of High and Mighty Lords, or the Lords the States-general of the United Netherlands, and in public addresses they are stiled their High Mightinesses.

Their arms are, gules, a lion rampant, holding in one paw a sword, and in the other a bundle of seven arrows; beneath the shield, which is surmounted with a ducal coronet, is the motto *CONCORDIA RES PARVÆ CRESCUNT*.

The council of state consists of twelve deputies of the several provinces, and their office is either triennial, or during the pleasure of their principals. In this council the deputies of Holland have the greatest weight, that province being possessed of three votes, while none of the others have more than two, and some of them only one. The presidentship indeed is held alternately by the twelve members, each in their week. The council of state assembles every day in the same court with the States-general. The principal affairs which come under the deliberation of this council are, those of the army and

revenue; and in conjunction with the deputies of the States-general, they also provide every thing necessary for the defence of the country, both in time of peace and war. The revenues under the direction of this council are those paid by the Seven Provinces, and the country of Drenthe, into the military chest, and by the Generalité-lands into the public treasury; as likewise all contributions, confiscations, and the like. Sometimes the council of state is summoned before the States-general; but whenever the latter require a particular conference with them, they only send two or three deputies. The title of this council is Noble and Mighty Lords. The treasurer-general is also honoured with this title, as being an assessor in the council of state, and may deliver his opinion; but has no definitive voice. The receiver-general has a seat in the same council.

The general chamber of accounts is composed of fourteen deputies, each province sending two. Their chief employment is to receive, state, and balance the accounts of the several provinces. The members of this chamber are also stiled Noble and Mighty Lords.

The general chamber of finances is subordinate to the former, and consists of four commissioners and a secretary.

The mint-office consists of three counsellors, assisted by a mint-master-general, a general assay-master, and an under secretary. All these several colleges meet at the Hague.

With respect to the administration of justice, the proceedings of the several courts are regulated by the particular laws of the respective towns and provinces where they are tried, the edicts of the states, and the civil law. Each province has its tribunal, to which, except in criminal cases, appeals lie from the petty and county courts, and if the party cast is disposed to stand a third trial, he may apply to the states of the province, who appoint certain persons learned in the laws and customs of that province to examine the decree, and pass a final decision. Justice is said to be no where so well administered as in these provinces.

The taxes payable by the inhabitants of the United provinces, and by those of the conquered lands, have been rendered necessary by the long and severe wars which the republic has sustained, and the number of them, especially in Holland, where they are always the heaviest, is so great, that a certain writer asserts, that the only thing which has escaped taxation is the air we breathe. The principal ordinary taxes are the duties on exports and imports, levied by the admiralty offices, and appropriated to defray the expences of the navy. The taxes on houses, lands, horned cattle, &c. and on the purchase money of all immoveables, under which are comprehended vessels of above eight tons burthen, for which the fortieth penny is paid; and this alone in Holland annually brings in above seven hundred thousand golden florins. The twentieth penny levied on inheritances in the collateral and ascending line. A poll tax, which obtains only in some provinces. The excise on all kinds of provisions, necessaries, and liquors; and here the money levied on bread and beer is estimated at above one third, that on wine at somewhat less, and that on turf for firing also at one third. There is likewise a duty on horses, coaches, and servants. The stamp paper used in all their several instruments, contracts, and bonds, is said to exceed four hundred thousand golden florins.

In particular emergencies, when the ordinary revenues are insufficient, the tax on lands and houses is doubled, and some other duties raised. Thus, in 1747, an edict passed for a voluntary aid, consisting of the fiftieth penny of every man's whole wealth and substance. The ordinary revenues of the republic are estimated at twenty-one millions of guilders; but as the contributions have fallen short of the expences incurred by their long wars, the state has borrowed immense sums from the inhabitants, and every one of the provinces labours under very heavy debts.

The United Provinces stand in need of a considerable military force for their defence, notwithstanding which, this has never been put on a proper establishment. Each province keeps on foot such a number of troops as it can conveniently maintain; but the Swiss regi-

regiments are paid by the States-general. In time of peace the forces of the republic seldom exceed forty thousand men, and very often their number is still less. In time of war the republic hires troops of the German princes, and keeps them in pay till peace be restored. The chief command of the army is vested in the stadtholder as captain-general; but the executive part, especially in time of war, is filled by the field marshal general. The fortresses are always kept in good repair. In 1755, the expences of the military establishment amounted to nine million eight hundred forty-four thousand four hundred and thirty-seven guilders sixteen stivers; but in 1756, only to nine million seven hundred sixty-five thousand and four. The naval force of the republic formerly made a great figure, and in some wars the Dutch have had at sea a hundred men of war; but the usual number in time of peace is only thirty, and those not always fit for service. It however passes for a certain truth, that the admiralties, by the assistance of the several provinces, can in a short time equip forty or fifty ships of the line. Their men of war are chiefly employed in cruising in the Mediterranean, to protect their trade against the Corsairs, or as convoys to the homeward bound Indiamen.

S E C T. IV.

Of GUELDERLAND.

Its Situation, Climate, Produce, and Rivers. The Government of the Province, its Divisions, and a Description of Nimeguen, Zutphen, and Arnheim.

GUELDERLAND, or Gelderland, is bounded on the north by the Zuyder-sea and Overijssel; on the east by the bishopric of Munster, and the dutchy of Cleve; on the south is divided by the Maese from Brabant; and on the west borders on Utrecht and Holland.

The air is the best in all the Seven Provinces, and the soil for the most part good. The country of Zutphen has such plenty of apple, pear, and cherry-trees, that it supplies all the other provinces with those fruits. There are here also large tracts of arable land, with a sufficient quantity of meadow grounds fit for pastures.

Guelderland is watered by the Rhine, and its three branches the Waal, the Yssel, and the Lek, and on its southern borders runs the Maese. The smaller rivers are the Linge, formerly called the Longwater, which takes its course between the Rhine and the Waal, till it falls into the Merwe; the Old Yssel which joins the Yssel near Doesberg, and the Berkel, which falls into the same river.

In the whole province are twenty-two towns, and two boroughs. It is divided into three districts, Nimeguen, Zutphen, and Arnheim, each of which has its own particular states composed of the nobility and towns. The number of the nobility admitted in the legislative power is not fixed, every one legally qualified being advanced to a share in the government at twenty-one years of age. The towns may depute as many as they please to assist at the diet of the district, though each town has but one vote. The assemblies of the states of each district are always held in the capital, from which it derives its name, and the burgomaster for the time being sits as president at the diet, at which all affairs relating to that district are determined. Two general assemblies of the states of the whole province, consisting of the deputies of the states of the three provinces, are annually held in the three capitals, one in spring, and the other in autumn. The burgrave of Nimeguen always sits as president, and in these assemblies all affairs relating to the whole province are regulated. Guelderland also sends nineteen deputies to the assembly of the States-general of the United Provinces.

The district of Nimeguen contains the south part of Guelderland, and lies between the Rhine, the Waal, and the Maese. Though this quarter is the smallest, it is the most considerable, and pays the largest contingent to the public expences. It contains only three towns that have a seat and vote in the assembly, the principal of these is the following:

Nimeguen, the capital of this district, stands on several little eminences along the river Waal, over which it has a bridge of boats, in the fifty-first degree fifty-two minutes north latitude, and in the fifth degree forty-six minutes east longitude. Towards the land it is very strongly fortified, it being the utmost boundary of the Netherlands to the east; but the great extent of its outworks requires a very numerous garrison. The churches here are two of Dutch Calvinists, the principal of which is that of St. Stephen, a French church, a Lutheran church, and five belonging to the Roman catholics. On the east side of the city, within the walls, stands an old burg, or castle, called the Falkenhof, which is said to have been built by Charlemagne; and the burgrave, who resides in it, is one of the most considerable nobles in all Guelderland. Within the walls of this castle are delightful walks, planted with rows of lime-trees. The stadthouse, which stands in Burg-street, is the place where the states of the quarter meet, and where the provincial diets are held.

In 1678 the celebrated treaty of Nimeguen was concluded here, and in 1702 marshal Boufflers formed a design of seizing this place, it being then without a garrison; but the earl of Athlone, the Dutch general, marched to its relief with such expedition, that the marshal's scheme was frustrated. Nimeguen carries on a good trade with the dutchy of Cleve, and sends great quantities of its white beer into all the United Provinces.

The Zutphen quarter, or county of Zutphen, is separated from Arnheim by the river Yssel. The soil is on the west and south sides not inferior to any in Guelderland; but to the eastward near the frontiers of Munster is full of heaths and morasses. It contains five towns that enjoy a seat and vote in the diets, the principal place in which is the following:

Zutphen, in Latin Zutphania, the capital of the county to which it gives name, stands on the banks of the Yssel, over which it has a bridge of boats, fifty-five miles east-by-south of Hanover. The Yssel here receives the Borkel, or Berkel, which divides the town into two parts, the Old and the New. The former of these is much larger than the latter; but both have extensive suburbs, which chiefly consist of pleasure-houses, yet by degrees have been included within the circuit of the walls. The town is well fortified, except towards the works in the suburbs, where there is less occasion for strength, as the country may be easily laid under water by means of the Borkel. There are here several pleasant walks, particularly on the ramparts, which are planted with trees. Zutphen was formerly a Hanse-town, and more opulent than at present. The Dutch Calvinists have two churches here, and there is also one belonging to the Walloons, another to the Lutherans, another to the Catholics, and another to the Mennonites. A gymnasium, founded here in 1687, has six masters. This town has several times been besieged and taken.

The Arnheim quarter, or the Veluwe, is separated from that of Zutphen by the Yssel. Its soil is for the most part very indifferent, especially towards the middle, which abounding in sand, heath, and brakes has the appearance of a wilderness; but the country near the river is as fertile as any other part of the Netherlands. It has five towns that enjoy a seat and vote in the diets, the principal of which is

Arnheim, the capital of the quarter, seated on the Rhine at the foot of the Veluwe hills, at no great distance from the place where the Yssel and the Rhine divide their streams. Over the latter of these rivers it has a bridge of boats, and before the Rhine-gate is a commodious harbour of a quadrangular form. The fortifications to the land-side were considerably enlarged in 1702 by that skilful engineer general Coehorn, who also enclosed within a strong line an eminence to the west of the town, which in case of a siege might be a great annoyance to it; but is now capable of containing a small camp for its defence. To the north of the town runs the molebeek, which fills the moats with water. The walls are delightfully planted with lime-trees, and may be walked round with ease in an hour and a half. The town itself is well built: here all the states of this quarter have their meetings, and it is likewise the seat of the provincial

vincial chief court of justice, and the chamber of accounts. Antiently the dukes of Guelderland, and after them the stadtholders of this province, kept their court in the old palace; which, whenever the hereditary stadtholder comes to assist at the assembly of the states of the province, is fitted up for his reception. In the great church, dedicated to St. Eusebius, are the monuments of several counts and dukes of Guelderland. The Dutch Calvinists have also another church, and there is likewise a French church and a congregation of Lutherans. Arnheim was taken from the Spaniards in 1585; the French made themselves masters of it in 1672, and kept it till the year 1674.

The above-mentioned district, called Veluwe, is surrounded by a narrow strip of land so extremely fertile, as to give occasion to a saying, that the Veluwe is a thread-bare coat with a very rich border.

It is proper to observe, that part of the upper quarter of Guelderland includes the quarter of Ruremond, which, with its capital of the same name, is subject to the house of Austria; and the small town and prefecture of Guedres, which belong to the king of Prussia.

S E C T. V.

Of the Province of HOLLAND.

Its Situation, Extent, Produce, and Rivers. The Populousness of the Country, and the Neatness of the Towns and Villages. The Government of the Province; with a Description of the Cities of Dort, Harlem, Leyden, Amsterdam, Rotterdam, the Hague, and the Village of Broek.

THE province of Holland is bounded on the south by Brabant; on the east by the provinces of Guelderland, Utrecht, the Zuyder sea, and the North sea; on the latter of which its whole western frontiers lie. This is the largest of all the seven provinces, and, according to the computation of the celebrated John de Witt, contains four hundred thousand acres; but later authors suppose that it contains four hundred and forty thousand.

Its situation is in general very low, and some part even lower than the sea, from which it is secured by dykes and dams, and intersected by innumerable ditches and canals, through which the water is carried off at the time of ebb. The air is foggy and unwholesome; however, the greatest part of the province consists of fine pasture lands, and therefore the principal employment of the country people is making butter and cheese; for which purpose they keep a number of milch-cows. The more southern parts of the province, which lie near Zealand, and also the west lands, as they are called, are excellent corn countries. The middle part of the province consists almost entirely of turf grounds.

Besides the large rivers common to the Netherlands in general, there are several smaller streams; as the Vecht, which coming from Utrecht falls into the Zuyder sea: the Amstel, which receives the Crooked Amstel, and runs through Amsterdam into the Y: the Zaan, which waters North Holland, and also discharges itself into the Y; as does also the Spaaren, which issues out of the lake of Harlem. On this river pass the larger vessels bound to Zealand, and other ports, crossing Harlem lake: the Shie, which runs through Delft to Shiedam, where it joins the Maese; as does also the Rotte at Rotterdam: the Gouwe, which proceeds out of the Old Rhine, and at Gouda falls into the Yssel: the Holland Yssel, which, after receiving its waters from the Rhine-canal, as it is called, discharges itself into the Maese; this river is also joined by the Vlist: and lastly, the Linge, which issuing out of Guelderland, traverses Holland, and loses itself in the Merve.

In several parts of the country these rivers are joined by navigable canals, which afford a cheap communication between the several towns and villages of this populous province, as, by means of the treckschuyts, passengers go from place to place at fixed hours on these canals, and at very cheap rates. Goods are likewise sent the same way, which is of unspeakable advantage to the inland trade.

The broad water, which passes by Amsterdam from the Zuyder sea, and divides the province into South and North Holland, or into Holland and West Friesland, is called the Y, or, as it is pronounced, the Ey, and at Beverwick forms the Wykermeer.

This province abounds in the most extraordinary improvements, and is amazingly populous, the number of its inhabitants being computed at one million two hundred thousand. The buildings in the towns are mostly of brick, and for handsome villages and cleanliness in their houses, it exceeds every other country; but in North Holland neatness is carried to an astonishing pitch. In that province are villages in which the houses, together with the rooms and furniture, are clean and bright beyond imagination; the buildings themselves, the floors, and every wooden utensil, both within and without, even to the very gates in the roads, and the posts in the pastures against which the cows rub, as also the very trunks of the trees, being painted: the chimnies likewise, with the cow stalls, both on the floor and on the sides, are kept extremely neat; but in these cow stalls the families themselves reside, to avoid soiling their shining rooms. Their streets too are paved with brick, and very carefully washed and strewed with a fine white sand.

The two parts of which this province consists are under one joint-regency, called the States of Holland and West Friesland, composed of the nobility and voting towns. The number of nobility admitted into the assembly of the States is not limited, and therefore not always the same. The nobility elect their several members by a majority of votes, but they seldom exceed ten. The voting towns, at the first foundation of the republic, were only the six following: Dort, Harlem, Delft, Leyden, Amsterdam, and Gouda; but William I. prince of Orange, added twelve more; so that at present they are eighteen, that is, eleven in South Holland, and seven in North Holland. The smallest of these cities has an equal voice in the provincial states with Amsterdam, which pays almost half the charge of the whole province.

Each member at his first appearance in this assembly, is obliged to swear to maintain the rights, privileges, immunities, laws, and customs of the country, and to give his vote according to his conscience, for the common happiness and prosperity of the province, without hatred, or regard to the interest of any particular town or person; to execute all the resolutions taken in the assembly with fidelity, and to keep inviolable the secrets with which he shall be entrusted.

The States of Holland enjoy entire liberty of speech, and are only answerable for their actions to the town which deposes them, without being liable to be called in question by any other authority. They meet four times a year, in February, June, September, and November. In the three former sessions they fill up the vacant employments in their disposal, consult about the common affairs of the province, and determine particular differences that may happen between the towns. In November they meet for raising such supplies as may have been granted by their deputies to the States General, for the service of the subsequent year.

The resolutions of the States are generally determined by a majority of voices; but in very important affairs they must be unanimous: so that the opposition of one of the smallest cities can prevent a resolution being taken; in which case the assembly is adjourned for a day or two, that the deputies may have time to return to their respective cities for farther instructions.

The grand pensionary of Holland is a person of great dignity; he has no decisive vote; he proposes the subjects of debate to the assembly of the states of that province, collects the suffrages of the nineteen representatives, pronounces the resolutions, and dictates the terms in which they are to be registered: he is also the constant deputy to the States General, and keeps the public registers and great seal of the province. He is elected by a majority of suffrages in the assembly of the states; and his office is properly only for five years, at the expiration of which a new election, or rather a confirmation of the former, must be obtained.

After

After the states of Holland, the court of the greatest authority is the provincial council of state, which, from the two parts of this province, is divided into two assemblies; that of South Holland consists of ten representatives, of which one always represents the nobility, and has the precedence of all the rest. These take cognizance both of the revenue and military affairs; and, when necessary, convene a general assembly of the states of the province. The assembly of North Holland is composed of seven deputies of the towns of that part of the province. These hold a joint assembly every year in the month of November, to settle, in conjunction with the deputies of the States General, the necessary funds to be levied in the subsequent year for the service of the army.

For the administration of justice there are two courts held at the Hague, namely, the court of Holland, and the high council. The provinces of Holland and Zeeland have always been so strictly united, as to have but one common high court of justice; and accordingly the court of Holland is composed of a president, with eight counsellors of that province, and three for Zeeland; a solicitor, two attorneys, a register, and six secretaries: Holland chooses the president two years, and Zeeland the third. The members of this court are excluded from being magistrates of cities, directors of trading companies, or enjoying any post, or any other salary than what is annexed to their office. The nobles of Holland, and the magistrates of the cities, are subject to the jurisdiction of this court, and appeals from the judgments of the magistrates are decided by it.

The high council of Holland and Zeeland is composed of a president and six counsellors for Holland, and three for Zeeland, a register, and a substitute. This court judges definitively in all cases brought before them by an appeal from the court of Holland, and gives judgment from which there is no farther appeal, except by way of revision.

The senate of Amsterdam consists of thirty-six members, part of whom have the direction of political affairs, and others the administration of justice. The dignity of a senator is for life, unless forfeited by mal-administration. The senate has the power of filling up vacancies, and directing all other affairs with a supreme and absolute authority, independent of the people. They choose the burgomasters and schepens, or aldermen, of every city. The first are always part of their own body, and in order to become a burgomaster it is necessary that a person has borne the office of a schepen. There are twelve burgomasters in Amsterdam, four of whom have the administration of affairs, and are from thence called regent-burgomasters. Three of these are annually changed, and the fourth continues in office a second year, to instruct the new-comers: he likewise presides for the first quarter, and then gives place to his colleagues, who in the same manner preside three months alternately, till the year is finished.

The schepen, or aldermen, form the chief court of justice in every city. In Amsterdam there are nine, seven of whom are annually elected, and two remain a second year. These have the administration of justice both in civil and criminal affairs; but, before they condemn a person to suffer death, they always consult the burgomasters on the merits of the cause; but are not obliged to conform to their opinion, and sometimes they give judgment contrary to it. There lies no appeal from their sentence in criminal causes. Where the punishment is capital, not only the proof of the crime is required to be extremely evident, but the prisoner himself must confess it; for which purpose they employ the rack and other tortures; but this is never done except when the evidence is so strong against the criminal as to leave no room to question his guilt, whence it is said, that an innocent person is never put to the rack.

There is another court inferior to the former, but worthy of being imitated by all Christian nations, since it seems founded on the very spirit of Christianity. This court consists of eight or ten members, stiled peace-makers, who are generally young gentlemen of fortune, who must be house-keepers and married. Their business is to make up all quarrels, and to prevent or dissuade peo-

ple from going to law. They, with one experienced magistrate at their head, also take cognizance of civil causes amounting to a sum not exceeding six hundred guilders, or about fifty-five pounds sterling. Their method of proceeding is by way of citation: the creditor summons his debtor to appear, and, after the fact has been stated, and both sides heard, the peace-makers determine what ought to be done, and order the parties to comply with it: but there lies an appeal from their decision to the schepens.

There is no where such large credit given to all sorts of persons as in Holland, and there never was any country where so few languish in prison. Whenever any person acquaints the magistrates of his inability to pay his creditors, and lays before them an exact account of his circumstances, they immediately order the commissioners of bankrupts to take possession of his effects, and exempt his person from all arrests for six weeks, which time is allowed him to compound with his creditors. In the mean time his books are laid before the commissioners to be examined, and all letters directed to him are delivered to them before he peruses them. If his endeavours to compound with his creditors prove ineffectual, and his failure appears to be owing to losses and misfortunes, the commissioners, when the six weeks are expired, sell his effects, and make a dividend, after which the magistrates acquit and exempt him from all claim, whether foreign or domestic; nor is it in the power of any or of all his creditors to hinder this, when the failure is not fraudulent.

There is also another method of obtaining absolute freedom in Holland still more expeditious, which is for the debtor to apply to the provincial high court of justice, representing his condition, and giving up all he has upon oath, after which he is exempted, as before, from all future claims, and may again engage in trade; but if the debtor here takes a false oath, the magistrates are authorized to punish him as they please, and even to sentence him to suffer death.

Holland, with respect to its ecclesiastical establishment, is divided into two parts, each of which has its particular synod. The synod of South Holland is composed of eleven classes, under which are three hundred and thirty-one ministers: the synod of North Holland has only six classes, in which are two hundred and twenty ministers. Besides these ministers of the established church, there are assemblies of English Presbyterians at Amsterdam, Rotterdam, Dort, Leyden, and Harlem; and at Amsterdam is an English episcopal church. The Remonstrants amount to thirty congregations, and thirty-eight ministers. The Lutherans compose nineteen congregations, and have twenty-seven preachers. The Roman catholics have about two hundred and fifty churches, and two hundred and thirty-five priests, among which are about forty churches and sixty priests of Jansenist principles. At Amsterdam is also the metropolitan church of the Moravians; and also a Quakers meeting.

The principal cities in Holland are the following:

Dort, or Dordrecht, in Latin Dordracum, is seated on an island in the Merwe, that was formed in 1421 by a terrible inundation, which destroyed no less than seventy-two villages, and about a hundred thousand persons. This city stands fifteen miles to the east of Rotterdam, and its situation is naturally so strong, that, though destitute of fortifications, it has never yet been taken. The number of houses in 1732 amounted to three thousand nine hundred and fifty-four. It is the seat of the mintage for South Holland, and has a seminary. The harbour is very commodious, and its trade considerable, especially in grain, Rhenish, and other wines; as also in timber, which, in summer time, is brought from Germany down the Rhine and the Waal, and here sawed in mills, of which there are great numbers about the city.

Harlem, Haarlem, or Haerlem, is situated on the river Sparin, which runs through it, and is the only passage for the many ships and other vessels coming from Friesland and other parts, in their way to the towns of Holland and Zeeland. Harlem stands fourteen miles to the west of Amsterdam, and enjoys a communication with that city and Leyden, by means of two spacious canals. The houses, which are neat brick buildings, in 1732

amounted to seven thousand nine hundred and sixty-three; but very few of them are built in the modern taste, or make an elegant appearance. There are in this city four Dutch Calvinist churches, one of French, one of Lutheran, and several mass-houses, the Papists being here much more numerous than the Protestants. Its manufactures of silk and linen, though still considerable, are greatly declined. The bleaching of thread and linen, for which this city is famous, employs a great number of hands. Once a most extravagant trade in flowers, particularly in tulips, was carried on here; but at present this passion, which was carried to a strange excess, is much abated.

The inhabitants attribute the invention of printing to Lawrence Coster of this city; on whose house, which stood in about the middle of the town, was a Latin inscription that he invented it about the year 1440: a statue was also erected to him on the same account; and in the town-house is kept in a silver case, wrapped up in silk, the first book that Coster printed. There is here an academy of sciences, founded in 1751.

In the year 1573 this city held out a famous siege against the Spaniards for ten months; during which the brave citizens were reduced to eat leather, and the vilest animals. They for a considerable time kept up a correspondence with the prince of Orange by carrier-pigeons, till the Spaniards discovering it, shot all the pigeons about the town. The citizens at last surrendered, on condition of being saved from plunder; but the Spaniards had the cruelty to punish the inhabitants for their bravery by a most inhuman massacre in cold blood. The garrison, which had consisted of four thousand men, was reduced to sixteen hundred, and of these they barbarously murdered nine hundred.

To the south of the town lie several beautiful seats, and a wood cut out into delightful walks and vistas.

Leyden, in Latin Lugdunum Batavorum, is seated on the Rhine, in the fifty-second degree fifteen minutes north latitude, and in the fourth degree ten minutes east longitude, and, next to Amsterdam, is the largest and finest city in all Holland. In 1732 the houses amounted to ten thousand eight hundred and ninety-one. The streets are long, broad, neat, and adorned with beautiful canals. Here are some fine churches belonging to the Dutch Calvinists, with a Lutheran, an English, a French, and a Mennonite meeting; as also several mass-houses, the Papists constituting the majority of the inhabitants. The university, founded in 1575 by William I. prince of Orange, is the largest and most antient in all the United Netherlands. Its library, besides a multitude of printed books, has two thousand Oriental manuscripts, many of which are in Arabic, and a large sphere adapted to the Copernican system, and moving by clock-work: it has also an anatomical theatre, an observatory, and a physic-garden. The celebrated cloth manufactures of this city are much decayed, the demand for them being greatly lessened. This city is famous for the long and severe siege it sustained in 1573 against the Spaniards, who encompassed it with seventy-two forts. This siege lasted above five months with such vigour, that the inhabitants were reduced to the greatest extremities, and above ten thousand of them perished: yet, considering the barbarous treatment Harlem met with, they resolved to hold out, and upon receiving a summons, answered, "They would never surrender, while they had one arm to eat, and another to fight." At length they cut the main bank of the Maese and the Yssel. At first the water rose but slowly; but the wind soon changing to the north-west, turned the country round Leyden into a sea, by which means fifteen hundred Spaniards were drowned. The anniversary of this deliverance is observed on the third of October as a solemn day of thanksgiving, and after sermon the same siege is represented in a tragedy, the money arising from which is applied to charitable uses.

Amsterdam, or Armsteldam, is situated in the 52d degree 20 minutes north latitude, and in the 4th degree 30 minutes east longitude, at the influx of the Y and the Amstel, where is a sluice, by means of which that river continues its course through the town. This is one of the greatest trading towns in Europe, and though from the shallowness of the Pampus, the only passage leading to it out of

the Zuyder sea, it might be thought but indifferently situated for commerce, as ships of burthen must be lightened in order to pass through it, and afterwards wait for an easterly or north-east wind, to go through the Marsdiep into the North Sea; yet the harbour is one of the largest and safest in Europe: and it has this advantage, that the other towns of the province can easily send their goods thither, and receive returns; and with a fair wind it is but a few hours passage to or from all the ports of North Holland, Friesland, Overijssel, and Guelderland. The ground is naturally marshy, and the buildings founded on oaken piles, which occasioned the facetious Erasmus to say, that in his country vast multitudes of people lived on the tops of trees. The middle of the town is intersected by a great number of navigable canals, which, while they conduce to the pleasantness and cleanliness of the place, are at the same time a great convenience to trade; but in hot and calm weather they emit fetid effluvia, which would be still worse, were not the water kept in continual motion by the working of two large water-mills, and one turned by horses. All the canals issue into the Y and the Amstel, and such as go far up into the town, being intersected by cross canals, have a communication with each other. These canals divide the town into a multitude of islands joined together by bridges, some of which are of stone and others of wood.

The city forms a semicircle on the Y, and is fortified on the land-side with ramparts and twenty-six regular bastions, and on that side the neighbouring country may be laid under water. On the side next the Y it is secured by a double row of piles driven into the river, projecting some feet above the surface; but in some places openings are left for ships to pass in and out, and in the night these openings are fenced with a boom. The piles extend in length no less than fifty thousand feet, and without them, in a place called the Laag, lie the large ships in such numbers, that their masts resemble a wood. In the intermediate spaces, between the town and the inner row of piles, are ranged innumerable small ships and barks.

The Amstel divides the town into two parts, and in 1732, when the houses were numbered, they were found to amount to twenty-six thousand eight hundred and thirty-five; but the inhabitants do not exceed two hundred thousand.

The gates of the city are very fine, particularly that of Harlem, which is adorned on each side with large columns, and a lion's head on the top of each; in the middle is the city's present arms, and on the frieze of the inside of the gate towards the town is the antient coat, which was a ship without a rudder. On each side of this gate is a guard-house, one for the burghers, and the other for the soldiers of the garrison, who are paid by the magistrates, and are under their command. There are four other principal gates; before which is a bridge of several arches, with draw-bridges, and another stone gate, that is shut every night. The bridge over the Amstel, which joins one side of the rampart to the other, consists of thirty-five arches, eleven of which are very high, and eight of them shut up; the rest of them being open for boats to go up and down the Amstel. This bridge is six hundred and sixty feet long, and seventy broad, with iron rails on each side.

Most of the streets are extremely clean; but, except those that have canals, they are much too narrow. They are, however, rendered less inconvenient by the hired coaches being set on sledges drawn by one horse. Merchandise is also drawn on sledges, which are not only the most useful vehicles for the inhabitants and their trade, but are calculated to preserve the houses, which, from their being built on piles, might in time be damaged in their foundations, by having a great number of wheel-carriages. Gentlemen's coaches are, however, for the most part set on wheels; but for this liberty they pay a considerable tax. The principal streets, or rather quays of the canals, are agreeably planted on each side with trees. The houses are rather neat than elegant or commodious: the nature of the climate renders it necessary to wash them often; but the greatest part of the people carry this kind of cleanliness so far as hardly to afford themselves

themselves time for the necessary care of their persons. The entrance of their houses is generally by steps, which rise four or five feet from the ground, and the passage into the rooms, which runs very deep, is floored and panelled with marble, which has an air of grandeur in miniature. They have much neat, and some rich furniture, which seems rather occasioned by an antient custom of neatness and elegance, than the effect of a luxurious and expensive taste.

Of all the buildings in Amsterdam the town-house is the most distinguished. It is two hundred and eighty-two feet in front, two hundred and thirty-two deep, and a hundred and sixteen high, exclusive of the cupola. It cost three millions of guilders, or three hundred thousand pounds sterling, when money was more valuable than it is now, which will be less surprising, if we consider that it is founded upon thirteen thousand large piles. This is a very grand and useful building, and yet it is neither elegant nor agreeable. It contains the offices and tribunals for the execution of the laws in the several branches of the military, as well as civil government. It is very observable, that the entrance of this building is very mean; but had the doors been proportioned to the rest of the edifice, they would have been more subject to be forced, upon occasion of those tumultuous assemblies of the people, that are not unfrequent in this country. The want of a large door suitable to the grandeur of the building is, according to Dr. Busching, a designed omission, the seven doors in number and uniformity representing the seven provinces. The inside is said to be very beautifully ornamented with marble, jasper, sculpture, and paintings. In some of their vaults, or cellars, are kept the treasures of the celebrated bank of Amsterdam; in others are confined criminals under sentence of death, and others again serve as apartments for officers of several classes. In the upper part is an arsenal, as it is called, though it is rather a collection of old-fashioned armour and weapons. The chimes of the tower are incomparable, and it commands a fine prospect of the city and its environs as far as the Zuyder sea. Among the other public buildings are the admiralty and East India-house, which are large and beautiful. On the harbour stands the arsenal and magazine for military stores both for sea and land-service. Among several things remarkable in this magazine is a reservoir on the top of the house capable of containing sixteen hundred tons of water, which, by means of leaden pipes, may be conveyed in case of fire to sixteen different parts of the city. Near the arsenal is the dock, which is above five hundred feet long.

In Amsterdam are eleven churches of Dutch Calvinists, two of which are parochial, with two of French, two of English, one of Arminians or Remonstrants, two of Lutherans, and three of Mennonites. The Armenian Christians have likewise a church here, but the Papists have a greater number of places of worship than all the above-mentioned sects put together, and in particular have twenty-four mass houses that are very large. The synagogue of the Portuguese Jews is a spacious and stately building of a quadrangular form, and the inside is extremely neat. The other Jews have also their distinct synagogues. The number of poor-houses is considerable; their incomes, and their conveniencies and cleanliness are worthy of admiration. Here is an hospital for aged men and women, consisting of several buildings; a new edifice for aged people of both sexes; the diaconie for old women, which is the most stately structure of them all, and in which old men also receive a comfortable support; with a receptacle for lunatics, and several orphan-houses, as the eleemosynary-house, in which are frequently two thousand children, the diaconie orphan-house, the burgher orphan-house, &c. There are also some houses of correction, as the rasp-house, where felons rasp Brazil wood for three, four, seven, ten years, or for life, according to the nature of their crime. When they are incorrigible, and too lazy to work, they are often put for an hour or two into a dungeon where water comes in; so that they must be continually labouring at the pump, in order to avoid being drowned. Here are also spin-houses, where prostitutes, and other women of bad character, are kept to spinning. All these foundations, and the good police of the city, have such an effect, that

there are no beggars in the streets: Here are officers who take up all vagabonds, and convey them directly to houses provided for that purpose, where they are forced to work every man in his own business, in proportion to his strength and ability. Here the poor who want work, and offer themselves, are received. In Amsterdam and most of the considerable cities in Holland, is also a public office, where all poor travellers that can give any account of themselves may go and take a loaf, a penny, and a passport, by virtue of which they are received gratis into the boats which carry passengers and goods from town to town.

They have also a charitable foundation, which is extremely remarkable. As persons of all nations resort to Amsterdam, many of whom have not much to spend, and the taverns are generally very dear, they have spacious edifices, where all poor strangers of both sexes who are obliged to make any stay in this city are received, neatly lodged, and have bed, board, and washing, for three days and nights, during which time, if any of them fall sick, they are removed into a neighbouring hospital; but after the expiration of three days, they must remove from thence, and are not allowed to return for six weeks, on pain of being severely punished.

Amsterdam abounds in artificers and manufacturers. Besides which, this city is alone in possession of half the immense trade which the Dutch carry on to the East-Indies, and governs the whole. Its commerce with Spain and the Spanish West-Indies is very great, nor is it less considerable to the Levant, Italy, and Portugal. Amsterdam also engrosses almost the whole northern trade carried on by the Dutch to Norway, and the countries situated in the Baltic.

Rotterdam, a large and populous city, fourteen miles to the south-east of the Hague, in the fifty-second degree ten minutes north latitude, and the fourth degree twenty-six minutes east longitude. It is seated on the Merwe, which at this place receives the Rotter, after it has taken its course through the city. This river is very broad, and of a depth sufficient to admit ships of tolerable burthen; but if they draw above fifteen feet water, they are obliged to take the way of Helvoetsluys to Rotterdam. The mouth of the Merwe lies five German miles to the west of Rotterdam, where it gradually becomes shallow by the gathering of the sands. The canals within the town are so deep, that the largest ships come up and take in, or deliver their cargoes at the very doors of the warehouses. Accordingly this city, next to Amsterdam, is the place of greatest trade, especially to England and Scotland.

In 1732, its houses were computed at six thousand six hundred and twenty-one. The finest street in Rotterdam is called the Haaring-sliet; most of the houses are noble stone buildings. The Boomties, or Boomquays street extends delightfully along the Maese, here called the Merwe, which is here near a mile and a half in breadth. It is upwards of half a mile long. It has a row of lofty trees, and the houses resemble palaces; on the other side runs the river, which has ships continually sailing in or out, or lying at anchor. This is the place of general resort for people of condition, to whom it serves as a mall.

The principal public buildings here are the bank, the East and West-India-houses, the arsenal, and the exchange. The first admiralty college of the United Provinces has its seat here, under the direction of twelve commissioners.

There are here four churches belonging to the Dutch, one of French, and one of English presbyterians, with an English episcopal church, whose minister has a hundred pounds sterling per annum from the king of Great-Britain, besides surplice fees, said to amount to two hundred pounds more; there are also a Scots and a Lutheran church, the last of which is new and handsome. The synagogue of the Portuguese Jews is a very fine structure, though not so magnificent as that in Amsterdam. Among other public buildings is the great bridge across the Merwe, in the middle of which is a fine brass statue of the celebrated Erasmus, who was a native of this city.

The Hague is a most beautiful place, situated in a very delightful country, ten miles north-west of Rotterdam; but, from its having neither gates nor walls, is called a village. It is, however, surrounded by a moat, bordered with a walk of lofty and shady trees, and at the avenues of the town is passed by means of draw-bridges. The streets are broad, several of them are without canals, and the houses are, for the most part, extremely well built. The number of coaches belonging to the noblemen and gentlemen, and the gay appearance in point of dress, give a very different idea of life from that of the trading cities. People here are more polite and easy in their behaviour, than in other parts of Holland; the most considerable persons in Europe meeting there, as well as the assembly of the States General, which also draws thither the greatest part of the people of the first distinction in the United Provinces. Indeed, the Hague may be considered either as a great city, or as a rural scene, while, as it is customary in great cities, they have plays and other amusements.

In 1732, the number of houses were found to amount to six thousand one hundred and sixty-four, besides the public edifices, and among the former are very large and regular buildings. There are also here several squares, which being planted with trees, and forming pleasant walks, occasion a great resort of people. Besides the States General, and those of the provinces, which render it the residence of foreign ambassadors, envoys, and other foreign ministers, here is the council of state for the United Netherlands, the council of war, the general chamber of accounts, the general mint-chamber, the council of Brabant, and several others.

The old palace of the counts of Holland at present belongs to the stadtholders, and has been repaired with some very magnificent additions. In the center of the area between the buildings of this palace, is the great hall where the trophies of the republic in their many victories over various enemies are hung up. Within this building are not only the above colleges; but a number of booksellers shops, and the church of the French Calvinists. At the Hague are also three churches of Dutch Calvinists, an English church, one belonging to the Lutherans, several mass-houses, and two Jewish synagogues, two alms-houses, an house of correction, and an orphan-house. The canals are not kept with such care as at Amsterdam and other places, on which account the air is thought to be less pure and healthy than in many other parts of Holland.

The environs of the Hague are extremely delightful; and in its neighbourhood is a fine pleasure-garden, in imitation of that of Vaux-hall: on the east side the town is bounded by beautiful meadows, to the south by splendid seats, to the west by sand-hills along the North Sea, on which side is a straight avenue paved with brick, and a walk for passengers, planted with several rows of trees leading to the village of Scheveling, which is at two miles distance; and to the north is a delightful wood, in which the stadtholder has a seat known by the name of The House in the Wood.

It will not be improper to mention here Broek, a large and handsome village of North Holland. The houses are all built of boards; they seldom exceed one story, and the roofs are tiled. The boards which form the outside are painted according to every one's fancy, and this is so often done, that the houses seem always new. The windows are generally shad- and decorated with beautiful curtains. The inside of the dwellings is not only neat, but embellished beyond what can be easily imagined, and all who have the smallest piece of ground before their houses, never fail to convert it into an agreeable garden, diversified with gravel walks, shell-work, images, and little hedges, or painted rails. The village is watered by canals, which are kept with the greatest care, and all the streets paved with bricks, which in some places are disposed in the form of flowers, and are frequently washed. That these ornaments may not be defaced, or their cleanliness interrupted, the streets are designedly made too narrow for carriages to pass through. The cattle, instead of being permitted into the village, are kept by the meaner sort of peasants, who

dwelt among the pastures, and all passengers must put up at the inns without the village. Not only the wooden furniture in the houses, but the very broomsticks are painted, as are also the gates and rails in the meadows. The inhabitants either trade or subsist on their fortunes, and among the latter are frequently many merchants, and tradesmen of Amsterdam, who having acquired a plentiful fortune, retire here to enjoy it in tranquility.

There are likewise within the province of Holland several small islands, that lie in the Zuyder sea, and formerly joined to the continent. The inhabitants of these islands being from their childhood innured to that element, make excellent mariners.

The principal of these islands is the Texel, which has a fruitful soil, and many of the inhabitants breed sheep, and besides trading in wool, make with the milk a kind of green cheese, which is much admired. In the whole district are six villages, and on the eastern coast is a commodious road, stiled the Mosco-road, which is the rendezvous of the outward-bound India ships.

SECT. VI.

Of the Province of ZEALAND.

Its Situation, and the Manner in which the Islands of which this Province is composed are secured by Dykes. Of the Air, Climate, and Produce of the Country; with a concise Account of the States, and a Description of the Cities of Middleburg, Flushing, &c.

ZEALAND or Zeeland entirely consists of islands formed by the many outlets of the Scheld. On the east it is bounded by Brabant, to the southward by Flanders, to the westward by the North Sea, and on the north by Holland. The name of this province, which signifies Sea-land, sufficiently points out its situation.

The islands of Walcheren and Schouwen, on the western coast, are defended against the violence of the sea by downs or sand-hills; and on the other sides, like the rest of the islands of Zeeland, by vast dykes, or banks, which at the bottom are twenty-five German ells broad, and at the top so wide that two carriages may pass abreast. The height is also proportioned to their thickness; yet in high tides and stormy weather, the waves, in many places, sometimes force a passage, or even flow over them. The first formation of these dykes must have been attended with immense labour and expence, since the very repair and maintenance of them require large sums. The dykes of this province alone would form a length of forty miles, each mile reckoned at fourteen hundred rods, and supposing the expence of one rod with another was six Dutch guilders, the expence of the several outward dykes taken together amount to three hundred and forty thousand pounds sterling.

Though the inhabitants of the other provinces, as well as foreigners in general, complain that the air is here heavy, disagreeable, and unhealthy; yet no people look better, or enjoy a more confirmed state of health than the natives, who are bred up in the country.

The soil is fertile, and famed for its excellent wheat, and also for madder, the cultivation of which employs many of the inhabitants. It likewise abounds in fruit, and its rich pastures are covered with flocks of fine sheep. The water around the islands supply the people with plenty of fish, particularly with oysters, lobsters, and muscles of an uncommon size and goodness. But though Zeeland enjoys plenty of all kinds of provisions, fuel is very scarce, especially turf, which being brought from the other provinces, bears a great price. They also use great quantities of English coals.

In the whole province are eleven cities, and a hundred and ten villages, some of which are very large. The inhabitants are said to be the most wealthy in all the Netherlands, which is in a great measure owing to their trade by sea, for which they have every convenience that can be desired. Their numerous privateers also, in time of war, are supposed to have brought great riches into the country.

The states of Zealand consist of seven members, the president of which is the first nobleman of the province, and the other members or states are the deputies of six voting towns, which are Middleburg, Zirkzee, Goes, Tholen, Flushing, and Veer. Zealand has two high courts of justice in common with Holland, of which we have already given an account. This province always sends four deputies to the assembly of the States General, who hold their office during life, and are alternately chosen from among the magistrates of the several voting towns, only Middleburg always sends one.

Middleburg, the capital of Walcheren, and of the whole province, is a large, handsome, rich, and strong town, which stands nearly in the center of the island, to which situation it owes its name, and is seated in the fifty-first degree forty-seven minutes north latitude, and in the third degree forty-one minutes east longitude. A canal a mile and a half in length affords this city a communication with the West Scheld, and is capable of receiving the largest ships. Middleburg is fortified with a wall, strengthened with thirteen bastions. Here the states of the province hold their meetings, as also the deputies who assemble in St. Nicholas's abbey. It is likewise the seat of the admiralty-college, the chamber of accounts, and the mint.

Here are several fine squares and stately public buildings, particularly the town-house, which is a noble pile, with a very high tower and clock, which last cost a hundred and fifty thousand guilders. It contains seven Calvinist churches, with an academy, an English, French, Lutheran, Mennonite, and Popish church, and a Jewish synagogue. It is a place of great trade, particularly in wines. In 1574, after a siege of two years, it fell into the hands of William I. prince of Orange, and has ever since been in the possession of the States. The high road from hence to Flushing is all the way beautifully planted with trees.

Flushing, in Dutch Vlissingen, is a well fortified town at the mouth of the Hondt, or Western Scheld, and defends not only the passage into that river, but also that to the other isles of Zealand, and even into Flanders by sea. It lies eight miles to the south of Middleburg. Its harbour, which is large and secure, lies between two moles, or dykes, on the south-east of the isle of Walcheren, and two canals. Its new harbour was formed at the general expence of the province in 1688, and is seventeen hundred Rheinland rods in length, with two hundred in breadth, and will admit, even up to the town, a fleet of eighty large men of war. To the right of the new haven, leading to the provincial basin, is a large dock, to the westward of which lies the entrance into the old harbour, which is divided into two departments, and serves for merchant-ships. The sea runs quite up to the other end of the town; so that loaded vessels come up to the very doors of the merchants. The houses are in general well built, and, besides other fine structures, the town-house is a magnificent and regular pile. In the town are three churches of Dutch Calvinists, one of French, one of English, and one of Mennonites. In the year 1749 one of the churches, the prince's palace, and the naval store-house, were destroyed by fire; but the first was soon rebuilt. This was one of the cautionary towns delivered up to queen Elizabeth by the States as a pledge of their fidelity, and as a security for the money that princess had expended in assisting them against the Spaniards, and of which the celebrated Sir Philip Sidney was governor in 1585; but it was redeemed again in 1616, under the reign of king James I. for an inconsiderable sum, much less than the money they stood indebted to England.

With respect to the other islands, South Beveland is both the largest and most pleasant, containing the town of Goes, and a considerable number of villages. North Beveland was once indeed the most pleasant and fertile country of all Zealand; but in 1530 and 1532 it suffered such a terrible inundation, that great numbers of people and cattle perished, and nothing was to be seen on the whole island but one steeple, which rose above the surface of the water. But about a century after, the ground being raised by the continual increase of the mud, the island was dyked in and cultivated, and at present con-

tains a small town and several villages. The island of Shouwen has the town of Zirksee, which has a seat and vote in the states of the province; with a small town and some villages. There are also the islands of Duiveland and Ter Tholen, in which there are several villages, and in the latter also a town of the same name with the island.

S E C T. VII.

Of the Province of UTRECHT.

Its Situation and Produce: the Number of its Cities, Towns, and Villages: the States of the Country, and its ecclesiastical Government; with a Description of the Cities of Utrecht and Amersfort.

THE province of Utrecht, excepting in one small slip of land to the northward, which borders on the Zuyder-sea, is wholly environed by Holland and Guelderland. It extends about thirty-two miles from the south-east to the north-west, and twenty-two from the south-west to the north-east. This country enjoys a good air, and in most parts the soil is very fruitful. Indeed to the eastward, near the borders of the Veluwe, it consists either of sandy hills or small eminences, which are in general covered with trees; but in some places contains spots of indifferent pasture-ground. On the south side, between the hilly part and the river Lek, it has good arable land, and to the westward the country perfectly resembles Holland; it chiefly consisting of rich meadows, though there are many spots of turf grounds.

In the province of Utrecht are five cities, and sixty-five towns and villages. Its states are composed of the clergy, the nobility, and the towns: indeed the former are merely nominal, and consist of nobles and citizens of the Calvinist religion, and not of ecclesiastics. They are, however, elected from the chapters of the five churches at Utrecht, and still in the assembly of the states represent the antient clergy of the country. The college of the deputies of this province consists of twelve members, each class of the states sending four. The chamber of accounts is under the direction of four commissioners, and the provincial court of justice is composed of a president, six ordinary and three extraordinary assessors.

The Calvinist congregations of this province have seventy-nine ministers, who hold a synod once a year at Utrecht. The Papists have above thirty churches in this province, under forty-five priests; the Lutherans two congregations and three ministers; the Remonstrants the same number; and the Baptists two.

The province of Utrecht is divided into four quarters, and has five cities, which have a vote in the states of the province; the principal of which are the following:

Utrecht, in Latin *Ultrajectum*, the capital of the province, stands in a delightful corn country, in the fifty-second degree ten minutes north latitude, and in the fifth degree seven minutes east longitude. It is situated on the river Rhine, which here divides itself into two branches, called the Old and New Rhine, both of which traverse the city through its whole length, after which they unite again. This city is pretty large, it being about an hour and an half's walk in circuit, and is also very populous, though it has no other defence than a wall on the old canal. The inhabitants chiefly consist of traders and artificers; but along the new canal are large and handsome houses inhabited by gentlemen.

Among the seven churches belonging to the Dutch Calvinists, the principal is the cathedral, which is dedicated to St. Martin, and stands in the center of the city; but only consists of the choir, the greatest part of the old cathedral being destroyed by a terrible storm in 1674, since which the tower has always remained separate from the body of the church. The chapter belonging to this cathedral is composed of forty members, who purchase their places, for which they generally pay between six and seven thousand guilders. The other chapter churches in this city are the Old Minster, or that of St. Salvator, St. Mary's, St. Peter's, and St. John's. In the first of these a part has been partitioned off, as a place of worship for the English who reside here, though they are not

very

very numerous. Over the church is a museum, which contains a variety of curiosities and antiques. St. Peter's church has been assigned to the French Calvinists, who constitute a numerous congregation. The Lutherans, the Remonstrants, and the Mennonites, have each of them a church, while the Papists meet in houses of which they have several appropriated for that purpose. In this city also resides the chief of the Jansenists in the Netherlands, who styles himself archbishop of Utrecht, and is elected by the nominal chapter, which, including the dean, consists of eight canons. The states of the province meet in a building called the States chamber, which is also the seat of the other provincial colleges. In the German-house resides the commander of the Teutonic order; here is also a celebrated university, which is dependent only on the city magistracy, and not on the whole province. Its physic-garden is particularly curious, and for the recreation of the students, on the east side of the city, just without the gate, is a beautiful mall, consisting of seven straight walks, two thousand paces in length, regularly planted with limes; but that in the middle is properly the mall.

In this city the memorable union was formed between the Seven United Provinces, in the year 1579. In 1672 the French took this city without the least resistance, and in 1712 a congress of plenipotentiaries was opened here from all the states in Europe, which, within two years, terminated in a general peace.

Amersfort, or Amersfoort, is situated fourteen miles to the north-east of Utrecht, on the river Ems, which has its rise in these parts from the confluence of several rivulets, and first receives that name here, where it becomes navigable. It is a strong town situated at the foot of a hill, in a pleasant and fertile country. The buildings, particularly those of the Old Town, are very neat. It has three churches, one of which is a large and stately structure. The hospitals of Amersfort resemble those of the larger cities, and here is a public school, where several persons of eminence have had their education. At this port are shipped all the goods brought out of Germany by the Hessian waggons, and consigned to Amsterdam. Its new erected manufactures of dimity and bombazines are in a thriving way. It formerly suffered much from the inhabitants of Guelderland, who took it in 1543, and in 1629 this city was also taken by the Spaniards, who afterwards quitted it.

SECT. VIII.

The Province of FRIESLAND.

Its Situation, Extent, and Produce: the Manner in which the antient Inhabitants escaped from the Inundations occasioned by the breaking of the Dykes: their Language, Religions, and Government; with a Description of Lewarden, Franeker, and Harlingen.

FRIESLAND, in Latin Frisia, is thus called from the antient Frisians, a martial people, who are said to derive their name from Frissen, to dig, they having recovered this country from the sea and rivers by digging, or casting up dykes. This country is bounded on the east by the river Lawers, which parts it from Groningen; on the south by Overijssel; on the west by the Zuyder-sea; and on the north by the German or North sea. Its greatest extent from north to south is thirty-seven miles, and from east to west thirty-two.

The air and soil of this province very nearly resemble those of Holland, especially in the north-west parts, which lie lower than the sea, and are particularly remarkable for their fine pastures, among which are excellent oxen, cows, and sheep, with numerous breeds of large horses, many of which are exported to Germany and other countries. In the more elevated parts are good corn lands, and the wheat produced in them is particularly esteemed for the fineness of the ears and the whiteness of its flour. The Friesland peas have also an agreeableness in their taste superior to most others. Here is likewise a great deal of turf ground; but the turf is inferior to that of Holland.

The inhabitants along the sea-coast are under the necessity of securing themselves by means of dykes, at a vast expence. Formerly, when the care of these dykes was only the concern of the proprietors of particular estates, they were very low, and frequently suffered to fall to decay; whence they became unable to withstand the impetuosity of the waves, especially when driven by a strong north-westerly wind. By these breaches the country was laid under water, and great numbers of people, as well as cattle, perished. To preserve themselves from these calamities, the inhabitants raised several eminences from twenty to twenty-five feet high, and of considerable circumference, to which, if not prevented by the rapidity of the inundation, they betook themselves, with their cattle and household-furniture, and there remained till the flood had subsided.

Friesland may vie with Holland in the number of canals with which it is in all parts intercepted. In the whole province are eleven towns, and three hundred and thirty-six villages.

The inhabitants still retain that strong passion for liberty which distinguished their ancestors, together with their customs and manner of living, even to the antient Frisian dialect and accent, which renders the language of the country people unintelligible to the other Netherlanders. Friesland is famed for its woollen stuffs; but more especially for its linen, which is the finest in Europe, the price of the best sort being at prime cost no less than twelve Holland guilders an ell.

The majority of the inhabitants are Calvinists; there are also many Papists, and a still greater number of Mennonites; which is the less to be wondered at, as Menno Simon, from whom they derived their name, was born at Witmarsum, and first propagated his doctrines in this province. These Mennonites form fifty-eight congregations, under the direction of a hundred and fifty-two pastors: the Papists have twenty-four congregations, and thirty-one priests: the Lutherans have only two congregations, and three ministers; and the Remonstrants have no more than one; but the Collegiants have several colleges.

The whole province is divided into three quarters, namely, Oostergo, Westergo, and Zevenwolde, each of which is again subdivided in grietenyes, or prefectures. Each of these prefectures annually chooses two deputies, one of which is a nobleman, and the other a wealthy freeholder, distinguished by his abilities and his virtue. The number of these prefectures being thirty, Friesland has of course sixty deputies, who are distinguished according to the three quarters. Eleven towns also send two deputies each to the assembly of the states, which is thus composed of eighty-two persons, who are annually elected.

The college of the deputy states consists of nine persons, six from the prefectures, and three from the towns. This college puts in execution the resolutions of the states with respect to civil and military affairs, as also those relating to the provincial revenues, the disposal of employments, and the like. The provincial court of justice is composed of twelve assessors, assisted by an attorney-general and a secretary. This court alone takes cognizance of criminal causes; but in civil, the first hearing is in the courts of the prefectures and towns.

With respect to its ecclesiastical establishment, Friesland is divided into six classes, under which are two hundred and seven ministers. Each class annually sends two ministers and the like number of elders to the synod, which is held eight days after Easter.

The principal places in this province are the following:

Lewarden, or Leeuwarden, the capital of the province, stands about sixty miles to the north-east of Amsterdam, and is a rich, populous, and strong town, the seat of its chief colleges, as also of the mint, and the residence of the principal nobility of Friesland, whence its buildings, as well public as private, are very magnificent. It has several canals which run through the streets, and are of great advantage to the trade of the inhabitants, which is very considerable, especially as these canals are continued not only to the sea, but to the most considerable towns in the province. The fortifications of this city are however

ever neglected. While Friesland enjoyed its own stadtholders, they resided in the Prinzenhof, in this city, which gave it an air of splendor and dignity; but they lost this honour in the year 1747, when William IV. was declared hereditary stadtholder of all the United Netherlands. The town-house is a noble structure begun in 1715. The Dutch Calvinists have here three churches, and in that of St. James, which is also called the Great Church, is the vault of the stadtholder's family. The French Calvinists have one church here, the Lutherans one, the Mennonites three, the Papists several, and the Jews a synagogue. Formerly a bay extended from the North Sea to this city, and was so large, as to be called the Middle Sea; but it being gradually dried up, the ground has been cultivated and built upon.

Without the city lies Marienburg, a palace belonging to the house of Nassau Orange.

Twelve miles to the west of Lewarden lies Franeker, which is situated on a canal, but is neither large nor fortified, though endowed with an university founded by count Lewis of Nassau. The halls of this university are in a building which formerly served as a convent to the fraternity of the Cross, and has a physic-garden belonging to it. There was here an antient castle, which falling to ruin, was lately pulled down. Here is also a good grammar-school, and an orphan-house. St. Martin's church is a fine building, with a handsome steeple.

Harlingen is, next to Lewarden, the largest and most populous town in all Friesland. It is situated on the sea, or rather on the Flie-water, and has a commodious harbour, with a depth of water sufficient for ships of the greatest burthen; but the entrance being obstructed by the gathering of the sands, part of the lading must be taken out before they can come in. It is pretty well fortified on the land-side, and, in case of necessity, the inhabitants can lay the whole country under water. To the west it is guarded against the invasions of the sea by dykes of prodigious strength. The Calvinist Dutch have two churches; but the wealthiest part of the inhabitants are Mennonites. Here are also some Lutherans and Papists. In 1580, the States made themselves masters of the town, and raised a strong castle here, which at that time stood close to the sea-shore.

S E C T. IX.

Of the Province of OVERYSSEL.

Its Situation, Produce, Civil and Ecclesiastical Government; with a Description of its principal Towns, viz. Deventer, Campen, and Zwol.

THE province of Overysfel, or Overissel, is bounded on the north by Friesland and Drenthe; to the east by the county of Bentheim, and the bishopric of Munster; to the southward by Guelderland; and on the west by the Zuyder Sea. Its name shews that it is on the other side, or beyond the Yssel, or Issel, with respect to those provinces that lie to the west of that river, as Holland and Utrecht.

The soil is for the most part marshy, yielding only turf; but along the Yssel is very good corn-land, with several pastures, though these have not the richness of the pastures in other countries; but instead of being the property of particular persons, they belong in common to the inhabitants of the nearest villages; however, the meadows along the rivers have excellent grass. The ground is in most parts low and level, except a ridge of small hills, which run near the center of the province from south to north. It is also a fine sporting country.

The province of Overysfel is, from the nature of its soil, not so well cultivated and inhabited as some of the other provinces, and therefore has only sixteen towns, with eighty villages, all which are ranged under three divisions, named Salland, Twenthe, and Vollenhoven.

Its states consist of the nobility and the towns, both of which have an equal weight in the public deliberations. The nobility are more numerous than in any other province, and a nobleman, in order to be admitted to the assembly of this class, must not only prove his descent, and that he is of the Calvinist religion; but

that he is upwards of twenty years of age, and in his district has an estate qualifying him to be summoned to the assembly, that is, of twenty-five thousand guilders. Any nobleman likewise who is in the army, and is possessed of these qualifications, is capable of being a member of the regency, provided he be not below the rank of captain; but when military affairs come under consideration, he must quit the assembly. The towns which send representatives to the states are Deventer, Campen, and Zwol, where the states alternately hold their annual meetings.

In this province is a college that may be considered as a chamber of state, or rather of finances, and is composed of six members, three of whom are appointed by the nobility, and three by the towns. It has likewise a chamber of accounts, and a chancery. In juridical affairs the three principal towns determine in the dernier resort; where, as from the sentences of the country courts, appeals may be brought before a higher tribunal, called the claringe, only held at Deventer, and before it the nobility and gentry have their first hearing. It is composed of the nobles and other persons elected by the three towns, who have a president at their head. This province sends five representatives to the States General, that is, two from the nobility, and one from each of the three towns.

The national clergy, consisting of eighty-four ministers, are divided into four classes, and each class sends three ministers and one elder to the annual synods. The Papists of this province are possessed of twenty-seven churches, and have thirty priests; the Baptists have sixteen, and thirty-five ministers; and the Lutherans three, and the like number of ministers.

The three great towns of the province that send deputies to the assemblies of the States, are the following:

Deventer, in Latin Daventria, is situated in a fertile pleasant country on the banks of the Yssel, and is the capital of the Salland quarter. It stands in the fifty-second degree twenty-five minutes north latitude, and in the sixth degree five minutes east longitude. Deventer is encompassed by a good wall, strengthened by eight bastions, some ravelins and outworks. It is not very large in circuit; but is close built, populous, and enjoys a very good trade. Here are three churches of Dutch Calvinists, one of French Calvinists, one of Lutherans, a meeting of Mennonites, and a mass-house. A gymnasium illustre was founded by the states of the province about the beginning of the seventeenth century. It was antiently a free imperial Hanse town, and has still the right of coining both gold and silver. The inhabitants at present brew excellent beer, of which great quantities are exported, and the Deventer cakes are celebrated all over these provinces. In 1589, the Spaniards made themselves masters of the town by treachery; but it was recovered by prince Maurice in 1591. In 1672, the French having reduced it without much opposition, conferred it on the bishop of Munster, whose troops kept possession of it till 1674.

Campen, a large city and port, is seated on the river Yssel, which a little before it discharges itself into the Zuyder-sea, is divided into several branches, the two principal of which form an island called Campen. The wooden bridge over the Yssel is a curious structure, it being seven hundred and twenty-three feet in length, and twenty broad: it is founded on piles; but the piers are at such a distance from each other, that it seems suspended in the air. It was formerly defended by a small fort on the other side of the river; but in 1673, that fort was destroyed by the troops of Munster. Though, according to the modern taste in fortification, this town must not be classed among the fortresses, yet on any emergency, it is able to lay the adjacent country under water. It is much smaller than Deventer, and not so compactly built; but carries on a small trade, and was one of the Hanse towns; it has also the right of coining gold and silver.

There are here three churches belonging to the Dutch Calvinists, in one of which the French Protestants are also permitted to assemble. The Mennonites, Papists, and Lutherans, are indulged in the free exercise of their religion. In 1672, the troops of France and Munster, having

having made themselves masters of this town, committed great outrages.

The last town we shall describe in this province is Zwol, which is seated in a pleasant country on the Aa, which here takes the name of the Black-water. It is seated at about an hour's distance from the Yssel, and somewhat farther from the Vecht; but has a communication with the latter by means of a canal called the New-Vecht. The Black-water being deep enough for ships of burthen, affords the town a communication with the Zuyder-sea, whence it is the handsomest and most wealthy place in all Overijssel. The north part is not only watered by the Aa, but intersected by two canals, and on the outside of two of the gates are very handsome suburbs. It is a very strong place, it being environed both with a wall and a rampart, strengthened by large and good bastions, with several outworks, among which are three forts to the south-west, which have a communication with each other, and with the town, by means of strong lines. The Dutch Calvinists have here three churches, besides which there is a French congregation of the same persuasion. The Papists meet in four mass-houses; the Mennonites are likewise very numerous; but there are few Lutherans. Zwol was antiently a free imperial Hanse town, and still possesses the privilege of coining. In 1672, it was taken by the bishop of Munster, who kept possession of it till the year 1674.

SECT. X.

Of the Province of GRONINGEN.

Its Situation, Produce, and Rivers: its Civil and Ecclesiastical Government, with a Description of the City of Groningen.

GRONINGEN, or Groeningen, is bounded on the north by the German ocean, on the east by the bishopric of Munster, and the principality of East Friesland, on the south by the territory of Drenthe, and on the west by the little river Lawers, which separates it from Friesland.

In its air and soil it nearly resembles the contiguous province of Friesland. The land for the most part lies low, and abounds in fine pastures, whence grazing is one of the principal employments of its inhabitants, and it has also some corn-land. The turf here is neither so good, nor in such plenty as in Friesland. On the south side of the province towards Drenthe, the ground consists of heaths and sands, interspersed with forests. Between its north-east side and East Friesland, the German ocean forms a large bay called the Dollert, which has a communication with the North Sea by means of the mouth of the Ems.

The principal river in this province is the Hunse, which is formed out of several streams, all which unite in the town of Groningen: in that city also rises the Fivel, which winding to the north-west, falls into the Ems. This province, like Friesland, is every where intersected with canals and dykes for carrying off the superfluous water.

It contains only three towns; but its villages amount to one hundred and sixty-five. The states consists of the town of Groningen, and the Ommeland or circumjacent country; of the latter some are elected by the nobility, and others by the peasants; but by way of qualification, they must be possessed of land within the province to a certain value. The city of Groningen is the only place where the states hold their meetings, and the time of their assembling is generally in the month of February. Here is also the college of the states deputies, which is composed of eight persons, that is, four as representatives of Groningen, and the like number from the Ommelands. These execute the resolutions of the states. The chamber of accounts consists of six persons, and Groningen sends six deputies to the States General.

The ministers of the established church, who amount to one hundred and sixty-one, are divided into seven classes, and the synod meets annually at the beginning

of May, one year at Groningen, and the next at Appingedam, and so on to five other towns, each of which belongs to a particular class. To this synod every class sends three ministers, with a certain number of elders. The Roman catholics in this province are possessed of about ten churches, under the direction of thirteen priests; the Baptists have twenty-seven churches, and sixty-one ministers; the Lutherans have three churches, and sixty-one ministers; and the Collegiants, two colleges in the town of Groningen.

This province is divided into two parts, the city of Groningen and its precincts.

Groningen, or Groeningen, the capital of the province, is situated in the fifty-third degree twenty-eight minutes north latitude, and in the sixth degree thirty-one minutes east longitude, at the confluence of several rivulets, out of which are formed the Hunse and Fivel. The former of these streams admits large ships from the sea quite up to the city, and is of course of great convenience to its commerce. Its extent was formerly inconsiderable, till in 1613 it enlarged itself towards the west and north, and its ramparts were repaired with the addition of seventeen bastions and a good counterscarp; but though these fortifications used to be carefully surveyed every year by deputies from the college of the states, yet they are now suffered to run to ruin. However, at about a quarter of an hour's distance from the town, has been erected a modern work in the form of a line, which is kept in a defensible state.

Groningen is the place where all the great provincial colleges assemble, and is consequently the residence of the richest and most eminent families both among the nobles and commons. It contains three churches of Dutch Calvinists, besides the university church, in which the sermons are preached in Latin by the professors of divinity. Among these the principal church is that of St. Martin, which is a fine structure, at one end of the great market, with a high tower. St. Mary's church stands at the end of the fish market, and has also a very high tower, and harmonious chimes. The Lutherans are also possessed of one church, the Mennonites of two, and the Roman catholics of five. Here are three market-places, the largest of which is the ox market, surrounded with fine buildings; and among these are the town-house, exchange, and weigh-house. In the three market-places terminate seventeen streets, six of which extend in a straight line to the like number of gates, and there are twenty-seven spacious streets in all. Most of the houses have pleasant gardens with fruit-trees. The prince's palace is on the north side of the city, and is adorned with pictures of all the princes of Orange and counts of Nassau. The university has professors in all the sciences, and in their library is a well-attested inscription that a soldier lived there sixteen days after receiving a wound in the right ventricle of the heart. They have also a public school for the languages, with seven masters, who have each a house and a handsome salary.

This city has often been taken; but in 1672 the inhabitants made such a brave resistance against the bishop of Munster, that after the loss of ten thousand men that prelate was at last obliged to raise the siege. We have now gone through the Seven United Provinces, and have only to consider the countries dependent on them.

SECT. XI.

Of the County of DRENTHE, or DRENT.

Its Situation, Produce, Towns, and Villages; with its civil and ecclesiastical Government, and a Description of the Town of Gouwerden.

THE country of Drenthe, or Drent, borders to the northward on the province of Groningen; to the eastward on the same province and the bishopric of Munster; to the southward on Bentheim and Overijssel; and to the westward on Friesland.

The ground here is visibly higher than in Friesland and Groningen, it bearing a nearer resemblance to that of Overijssel. The more elevated parts are woody, but along the rivers it affords good pasturage. Its most com-

mon grain is rye, and a few places also produce wheat. With respect to the harvest of the latter, a singular custom prevails, that it must every where be begun on a certain day, which is proclaimed by tolling the bells in all the villages, and one stated day it must likewise be every where concluded. The southern parts are over-run with marshes.

The places in this country are, two market-towns, thirty-seven villages, one fortress, and two forts. The states consist of the nobles and freeholders; but every nobleman belonging to them must be possessed of an estate sufficient to qualify him to sit and vote, and there being only eighteen such estates, the legislative part of the nobility amount only to that number. There are also thirty-six freeholders, who are annually elected by those villages that have a right of voting. The ordinary assembly of the states every year is held at Assen towards the beginning of March. The president of this assembly is the intendant of the country, and is always nominated by the hereditary stadtholder.

This country was formerly a county of the German empire. But it threw off the yoke of Philip II. king of Spain, and became a free state; yet probably on account of its smallness was never able to obtain the privilege of sending a representative to the States General, it being only under their protection, and to every hundred florins raised by the Seven United Provinces it pays only one.

Besides the above assembly of the states, here is another college composed of the intendant and four deputies, two from among the nobles, and two from the freeholders. This college meets eight times a year to execute the resolutions of the States, and on these occasions has two more members added to it, one out of the nobility, and the other from among the freeholders. The supreme court of justice here consists of an intendant, an assessor, and twenty-four counsellors, who decide without appeal.

The clergy are divided into three classes, under the direction of forty ministers. Each class sends a determinate number of ministers and elders to the synod, which is always held at Assen in November; but has no connection with the synod of the Seven United Provinces. The principal places in the county of Drenthe are the following:

Assen, the capital of the county, is situated nearly in its center, on the rivulet of Hoorendiep, and is well built.

Coeverden, or Covorden, a strong fortress near the frontiers of the county of Bentheim, and strengthened with seven bastions, that take their names from the Seven United Provinces, and likewise with the same number of half-moons and ravelins, together with a counterscarp; besides which there is a citadel distinct from the town, fortified with five bastions. These works are kept in repair at the expence of the States General. The fortress itself stands on a sandy ground; but is on all sides environed by a morass, which terminates on the out-works. A small quantity of rain lays all this morass so effectually under water, that the place immediately becomes inaccessible. Its strength has procured it the name of the key to Overijssel, Friesland, and Groningen.

In the year 1592 it was seized by prince Maurice for the States, and immediately fortified in the best manner; and in 1607 count William Lewis of Nassau-Dietz put it into so good a state of defence, that it was thought impregnable; but some of the governors permitting the inhabitants to drain and inclose the adjacent lands, and convert them into fields and meadows, this oversight, with the want of artillery and military stores, occasioned its being taken by the bishop of Munster, after a very short siege, in 1672, though not without a stout resistance: however, on the last day of the same year the States recovered it by surprise.

S E C T. XII.

Of the Generalité Lands, including Dutch Brabant; their Government, and the Religions of the Inhabitants; with a

Description of the Cities of Bois le Duc, Breda, Berg-op-Zoom, Maëstricht, and Sluys, in Flanders.

BY the Generalité Lands is meant that part of the Netherlands that has been subdued by the Seven United Provinces, by their joint arms, and solemnly ceded to them by treaties and conventions. The nobility and towns of these countries, particularly those of Brabant, have frequently sought to become members of the state, and to be allowed to vote as a distinct province in the assemblies of the States General; but this has as often been denied them. They, however, retain all the privileges they enjoyed when they fell under the power of the republic. The hereditary stadtholder of the United Provinces is governor-general over all these countries; and the States General, probably from a principle of œconomy, never appoint particular governors to any particular province. They have indeed governors of fortresses, but their power is limited to the soldiers. The States General and the council of state annually send some of their members to execute all affairs of importance, who, at their return, lay an account of their proceedings before the assembly.

Justice is here administered by several colleges; first by the court of Brabant, under whose cognizance is that part of Limburg which belongs to the States, and this college holds its sessions at the Hague: the second is the Flanders court, which meets at Middleburg; and the third the court of the upper quarter of Guelderland, which has its seat at Venlo.

The established religion in these countries is the Calvinist; but the Catholics, being much more numerous, are permitted an entire freedom in public worship, except in processions and other public solemnities.

The Generalité Lands consist first of a part of Brabant. This district contains the whole quarter of Bois le Duc, and a small part of the Antwerp quarter, it bordering towards the north on Guelderland and Holland; to the eastward on the dutchy of Cleve and the upper quarter of Guelderland; to the southward on the bishopric of Liege and Austrian Brabant; and to the westward on Dutch Flanders and Zealand.

The court for Brabant, which is the high tribunal for this country, and likewise of that beyond the Maese, meets at the Hague, and consists of a president and eight assessors, with several officers for various cases, as those for widows, orphans, and other destitute persons. It is invested with an unlimited power, and grants patents, privileges, favours, and pardons; confers honours, naturalizations, &c.

The soil of Bois le Duc is sandy, and for the most part naturally barren; but by the indefatigable industry of the inhabitants is brought to yield good pulse, rye, and buckwheat, with oats and flax, though it affords little or no wheat and barley. It has also good fruit, and plenty of poultry and wild-fowl. The inhabitants are very fond of field sports, especially of falconry, and most of the falconers of the European princes are of this country.

The principal city in the quarter of Bois le Duc is the city of the same name, called in Latin Silva Ducis: it is situated in the fifty-first degree thirty-six minutes north latitude, and in the fifth degree twenty-five minutes east longitude, at the confluence of the rivers Dommel and Aa, which, after their junction, are called the Dieft. At about an hour's distance from hence, this river loses itself in the Maese. Formerly Bois le Duc was surrounded by a deep morass; but some parts of this morass becoming dry, rendered it necessary to strengthen the works towards these accessible places. It was also defended on the north-west side by a citadel, on the south by two forts, and on the north side by a small fort. The city is pretty large, and intersected by many canals; it has three churches belonging to the Dutch Calvinists, with one of French, one of Lutherans, and ten mass-houses; the majority of the people being of the Romish religion. The trade and shipping of Bois le Duc are considerable. It was first founded in 1184 by Godfrey III. duke of Brabant, who caused a wood here to be cleared and used in building the houses, and to this circumstance it owes its name, which signifies the Duke's wood. In

1559 pope Paul IV. erected a bishopric here; but on its being taken by the States in 1629, the see was abolished.

Within that part of the quarter of Antwerp is the barony or free lordship of Breda, which consists of good corn land and pastures; but has many heaths and morasses. Its principal rivers are the Merk, or Mark, which, after receiving several other rivulets, is called the Dintel. This barony belongs to the house of Nassau; the sovereignty of it is lodged in the States General. The principal city it contains is the following:

Breda, the capital of the barony of the same name, is seated on the river Merk, which at this place receives the Aa. The latter of these two streams being a little before increased by the Byloop, is here rendered navigable, and has a communication with the German ocean. It stands in the fifty-first degree thirty-five minutes north latitude, and in the fourth degree fifty-two minutes east longitude. Its fortifications, without very great improvements, are unable to stand a long siege, though the city itself is partly covered by a morass, and, by means of the Merk and Aa, the inhabitants are able to lay a part of the country under water. It consists of about fifteen hundred houses, is well built, and contains a regular castle encompassed with a moat; and fronting the entrance is a square delightfully planted with trees. The great church, now in the hands of the Protestants, has several very fine monuments, and a handsome spire three hundred and sixty-two feet high: the Dutch have also another church, and the French have also one, as have likewise the Lutherans; but though the Roman Catholics are more numerous, they are allowed only three chapels. The town-house is a large structure, and there are four spacious market-places; but its commerce and woollen manufactures are greatly declined.

In 1590 prince Maurice took this city by stratagem; but the Spaniards recovered it in 1625, and in 1637 the States again made themselves masters of it. Here king Charles II. resided when invited over to England, and his famous declaration was dated from Breda. In 1667 the treaty between him, Lewis XIV. of France, and the States General, was concluded here.

Twenty miles to the west of Breda is Bergen-op-zoom, the capital of a marquisate of the same name; through it runs the rivulet or rather moat of Zoom. The south side of the town stands on a small eminence. It has been long celebrated as a strong fortress; and its wall, which is about an hour's walk in circuit, is defended by five bastions and ten horn-works. Besides the other fortifications on the north side, a strong line was drawn there in 1727, that has a communication with Moermont, Pilsen, and Rover forts, and the South or Water fort of five bastions commands the entrances of the old and new harbour. The adjacent country may also be laid under water; and as long as Zealand continues clear of enemies, supplies and reinforcements may be thrown into it by means of the Scheld. It contains about eleven hundred houses, with an old palace called the Hof, that was once the residence of the marquises of Bergen; and at present the chamber of accounts, and the feudal court belonging to the marquisate, are kept in it. Here is a Dutch Calvinist church, and another divided into two partitions, which is assigned to the French Calvinists and the Lutherans. The Papists have likewise a chapel. The States General keep a good garrison here, and the governor is always a person of distinguished reputation.

This town was first walled in 1287. In 1588 and 1622, it held out against two powerful armies of Spaniards; but in 1747, the French made themselves masters of it by surprise, after a siege of ten weeks. It was, however, restored in 1749, though in a very ruinous condition; but the houses and Dutch church demolished in that siege, have been since rebuilt.

Maestricht is one of the most antient and remarkable cities in the Netherlands, particularly for its strength. It is seated in the fiftieth degree fifty-one minutes north latitude, and in the fifth degree thirty-eight minutes east longitude, on the banks of the Maese, by which it is divided into two parts, joined to each other by a grand stone bridge. The smallest, which is situated to the

side of the dutchy of Limburg, is called Wyk. Maestricht is one of the strongest fortresses belonging to the republic, and also one of the principal keys of the Maese. Some defect having been observed in the out-works, the late stadtholder William IV. about a month before his death, took a survey of them, and a plan was formed for their removal. The Jeker, a small river that runs through the south side of the town, and falls into the Maese at the bridge, may be checked in its course by means of sluices, and the level country laid under water.

The houses within the walls amount to about three thousand, besides which there are three Calvinist churches, that is, two of Dutch, and one of French, with a Calvinist grammar school, a gymnasium, a Lutheran church, two Popish collegiate, and four parochial churches, eight convents of monks, eleven nunneries, one Jesuits college, and a commandery of the Teutonic order. Though the Papists are permitted the free exercise of their religion, yet they are allowed to make their public processions only twice a year, and then only round the two collegiate churches. The town-house is a stately edifice, and has a public library. There are two other elegant buildings: these are the house of the deputies of the States General, and that of the governor. This city had once a considerable cloth manufactory; but it is now greatly decayed.

The sovereignty of the town belongs jointly to the States General and the bishop of Liege; but the former alone garrison it, and are likewise possessed of the sole power over the convents and ecclesiastics, by virtue of which they grant privileges and immunities of all kinds. In other respects the town is under the joint government of the States and the bishop; and the towns are divided into two departments, each electing half of the magistracy, which consists of an equal number of Calvinist Brabanters and Papists, born in the bishopric of Liege. Every year both sovereigns send four deciding commissaries, as they are called, that is, two each, for the final determination of causes, and other affairs relating to the town.

Antiently Maestricht was immediately subject to the head of the German empire; but in 1204 the emperor Philip ceded it to Henry II. duke of Brabant. In 1632 this city was taken by the troops of the States General, and in 1648 their possession of it was confirmed by the crown of Spain, at the peace of Munster. In 1672, the French made themselves masters of it, and in 1676, king William III. endeavoured to recover it; but without success. It was, however, restored to the Dutch at the peace of Nimeguen. In short, in 1748, agreeable to the preliminaries of the peace of Aix la Chapelle, it was ceded to the French, who again evacuated it at the conclusion of the peace.

About two musket-shots from this place stands a hill, called St. Petersburg, which being much higher than the town, and having been very detrimental to it in a former siege, the States General caused a very strong fort to be erected upon it in 1701, under the name of St. Peter's fort. This lying within the territory of Liege, the bishop complained loudly of this proceeding; but in 1717 the affair was accommodated. On this hill is an excellent horizontal quarry, with an entrance to it close by the Maese, so that carts go in and unload at the bank of the river. Within this quarry are long passages supported by innumerable square pillars, which are every where twenty feet high, and in many places more. It has several vent holes cut in it, as also some small reservoirs, and in war-time it is a safe refuge to the country people, who being acquainted with all its windings, secure their cattle and valuable effects in this subterranean retreat, which affords room for forty thousand men. A stranger who should visit it without an experienced guide, would be in danger not only of bewildering himself, or of stumbling against the corners of the pillars; but of being suddenly shot by villains lurking there. The upper part of the hill consists of good corn land, and on the side towards the Maese stands the monastery of Slavante.

To the States General also belong the most northern part of Flanders; a small district lying between the German ocean, the Hondt, the Scheld, and Austrian Flanders. This country was ceded by Spain at the peace of Munster, to the States General, and afterwards enlarged by the emperor at the barrier treaty of 1715, and contains Sluys, and the little towns of Ardenburg, Oostburg, Hulst, and other small places.

Sluys, and in French l'Ecluse, stands on a bay in the German ocean, named the horse-market, from the supposed resemblance it bears in stormy weather, to the noise of a market filled with those animals. The town is pretty large in circuit; but the greatest part of it is taken up with garden and bleaching grounds. It is strongly fortified, and the country towards the south and south-west may be laid under water; but the north side being higher, has a double wall. On the east it is

fenced by the bay, and by a morass, which every flood is laid under water. All the efforts of an enemy cannot hinder its communication with the sea, whence it may receive all necessary supplies and reinforcements. Its air, however, is so unhealthy, that the garrison is changed every year. The governor's power extends to all the fortified towns in Flanders, belonging to the States General. The harbour is so choaked up, that to the very great detriment of the town, it admits only of small vessels. The old castle which stood by the side of the harbour, is at present converted into lodgings for the governor and other military officers. In 1405, the English miscarried in their attempt on this place. In 1587 it was taken by the Spaniards; but in 1604 recovered by prince Maurice. The besieged held out for three months, till they had eaten up all the leather, mice, and rats they could find.

C H A P. XXII.

Of the Thirteen United Cantons of S W I S S E R L A N D, with their Allies:

S E C T. I.

The Situation, Extent, and Face of the Country, with respect to its Mountains and Vallies. Its different Climates, Fossils, and Minerals. Its Springs, Rivers, and Lakes. Its Fruits, Vegetables, and Animals.

SWISSERLAND, or Switzerland, the Helvetia of the antients, is bounded on the north by Swabia; on the west by the Sundgaw, Burgundy, and the country of Gex; to the southward by Savoy, the Milanese, and the territories of Venice; and to the eastward by the county of Tyrol and Swabia. Its greatest length, according to Busching, is about two hundred and eighteen miles, and its breadth one hundred and forty-two.

Though Swisserland is situated between the forty-fifth and the forty-eighth degree of north latitude, yet lying among the Alps, the highest mountains of Europe, the air is much sharper than in most northerly latitudes. This is indeed the highest country in this part of the earth, the greatest part of it consisting of chains of hills ranged one upon another, with only narrow vallies between. These hills are also composed of stupendous rocky masses, two, four, and even six being piled on each other, and from four to twelve thousand feet high. One peak of a mountain called the Gotthard, is by du Cret computed at sixteen thousand five hundred French feet. The lower parts of these high mountains are covered with woods and pastures, the herbage in which is of a remarkable length and richness. The middle abounds with a great variety of odoriferous herbs, thickets, bushes, and excellent springs, and in summer are resorted to by herdsmen with their cattle. The third part of these mountains almost entirely consist of craggy and inaccessible rocks, some of which are quite bare, without the least herbage growing upon them, while others are continually covered with snow or ice. The vallies between these icy and snowy mountains appear like so many smooth frozen lakes, and from them vast fragments of ice frequently fall down into the more fruitful spots beneath. It is from these masses, and the thawing of the ice and snow, that the greatest part of the streams and rivers in Swisserland are derived. The ice hills begin in the canton of Glaris, and after passing through the territory of the Grisons, and from thence into the canton of Uri, terminate in the district of Bern. The most lofty of these mountains are those in the canton of Uri, namely, St. Gotthard, Furka, Crispalt, and Luckmanier, which send forth rivers to all the principal parts of Europe.

This is the most dreary part of all Swisserland; for on the summits of these mountains an eternal cold almost constantly prevails, with hard gales of wind, and very damp fogs; while the valleys, except some towns and villages, with a few fields and vineyards, thick woods, and rich pastures, are covered with lakes, and the summer heats are there frequently so insupportable, that the inhabitants betake themselves to the mountains, though in winter their houses are almost buried in snow. In many places within a small compass, the four seasons are seen at once, and sometimes summer and winter are so near each other, that one hand may take up snow, and the other pluck the flowers.

During the greatest part of the year the clouds hang beneath the peaks of the highest mountains, and from those peaks they resemble a sea, from which the peaks rise like islands. Sometimes they break, and thus display a view of the extensive country beneath. From the rising and sinking of these clouds, the inhabitants form pretty certain conjectures with respect to the weather. Not one of the above mountains is without a cataract, and as the eye by reason of the intervention of the clouds is not always able to reach the beginning of them, they look as if poured down from heaven upon the rocks.

The water thus falling from one rock to another, makes an astonishing noise, and raises a mist around it, on which when the sun beams play, is formed a very beautiful sight, particularly at the foot of the cataract, where is exhibited a rainbow of the most lively colours.

Among these mountains are many medicinal springs; some of which form cold and others warm baths, celebrated for their extraordinary virtues.

Very different from this is the remaining smaller part of Swisserland, including the county of Thurgaw, which is a part of the cantons of Zurich, Schaffhausen, Berne, Basil, Solothurn, and Freyburg; for though this district is not without mountains, some of which are even two thousand or two thousand five hundred feet high; yet it is much more level than the above-mentioned part, and the foot of the mountains, and sometimes also the very summits, are covered with vineyards, corn-fields, meadows, and pasture grounds. Here are likewise no rocky precipices, no cataracts, few trees, and, in summer, neither snow nor ice. The mountains, instead of being interrupted with vast chasms or abysses, are generally entire, and composed of a few eminences, the summits of which are so far from shooting into peaks, that they are flat or round to the extent of many miles, without any considerable inequality, and frequently afford not only pasturage, but arable land. It is only during long

long rains that the clouds sink below the eminences. The fields, though generally stony, are fertile, and the meadows are in most places planted with fruit-trees. "There is no country in the world better supplied with water," says Mr. Addison, "than the several parts of Swisserland that I travelled through. One meets every where in the roads with springs continually running into huge troughs that stand underneath them, which is wonderfully commodious in a country that so much abounds with horses and cattle. It has so many springs breaking out of the sides of the hills, and such vast quantities of wood to make pipes with, that it is no wonder they are so well stocked with fountains." Indeed these comparatively level parts of Swisserland are watered only by a few rivers; but those are large.

There are here found great numbers of petrifications, and the fossil tribe is very considerable, as chalk, mundic, several kinds of clay for the making of earthen-ware, and crucibles, as also terra-sigillata and sulphur. In many parts slate is very common; and though white marble be scarce, it abounds in a black sort interspersed with veins of white, as also in brown, yellow, and, in some places, in a green, and even carnation coloured marble. Red porphyry, speckled with white, has likewise been found in the icy mountains. Common gypsum and alabaster are not uncommon, and of the latter here is the fine sort so much prized by sculptors. A kind of stone full of glittering sparks of a brown colour, and capable of a very fine polish, is very common here; and several sorts of crystal composed of lamina and angular columns. Its other fossils are sandstone, saltpetre, salt, pit-coal, and near Roche a pure and transparent sulphur, with a rich sulphureous ore. Gold-dust is found among the sand of some of its river; but in no great quantities. Swisserland has also silver, copper, lead, and more particularly iron ores, of which Gunzen, a lofty mountain in the county of Sargans, yields three kinds, namely, black, red, and iron coloured, which being mingled by fusion, without any other ingredient, form a true steel. It must, however, be owned, that the metals of this country are generally observed to be brittle, and accordingly all metallic attempts, a few iron mines excepted, have turned out to the disadvantage of the undertakers.

The principal rivers are the Rhine, a name given by the Swiss to all streams and rivers in general: it has its rise in the country of the Grisons, and, with respect to its source, is divided into the Anterior, the Middle, and Hinder. The Anterior or Upper Rhine issues from a small lake on a mountain commonly called the Oberalp, and by some Cima del Baduz. The source of the Middle Rhine lies in Luckmanier, a part of the Adula chain, and, after a course of about six hours, joins the Anterior Rhine. The Hinder Rhine rises about three hours distance in a mountain called by the Italians Monte del Uccello, or Birds-hill. The other rivers are the Rusa, which issues from the lake called Lago di Luzendro, on the mountain called St. Gotthard, and having joined two rivulets, precipitates itself through a deep and narrow valley down several rocks; but at length becomes more gentle, then falls into the lake at the four Forest towns; but at Lucern again makes its appearance under its former name, and soon after receives the Lesser Emmat, or Emmen, which rises in the mountains, and at last discharges itself into the Aar, or Aren. This last river, which proceeds from the mountain of Grimsel, at length falls into the Rhine. The Rhone is first formed by a water which issues out of two rocks of ice on the Furka chain, and precipitates itself with a thundering noise between two rocks of an astonishing height, which receiving several rivulets in its course, runs into the lake of Geneva, and issuing again from thence traverses the territory of that city, and after watering a small part of Savoy enters France. The Tesin, in Italian Tesino, rises partly from two lakes on the mountain of St. Gotthard, and partly from several other lakes on the mountains, and after passing through the valley of Livis, and the Lago Maggiore, enters the dutchy of Milan, and at length loses itself in the Po.

The large lakes are those of Geneva, Neuenburg, Biel, Zurich, the four Forest towns, Thun, and Brien, with

many others: that part of the lake of Constance which waters the borders of Thurgaw, and the abbey of St. Gall, belongs also to the Helvetic Confederacy.

These several rivers and lakes are of considerable advantage to Swisserland, by supplying it with fish, and furnishing the inhabitants with the means of water-carriage.

The levels and valleys produce grain; but not in a sufficient quantity to answer all the demands of home consumption. Barley is sowed in a very elevated situation, the oats in a warmer soil, rye in a warmer still, and the warmest of all is assigned to spelt. Flax is much cultivated and worked, and the like may be said of hemp. They have also begun to plant tobacco. The Pais de Vaud, the cantons of Berne and Schaffhausen, the Veltlein, and the Valais, produce the best wines in Swisserland. There are here plenty of apples, pears, nuts, cherries, plums, chesnuts, and the parts towards Italy abound in peaches, morells, almonds, figs, citrons, pomegranates, and others. Most of the cantons abound in timber.

Of wild animals the chamois are the most remarkable, and of two different species; one of which make their constant abode in the highest and wildest mountains, to which scarce any access can be found. These are of a reddish brown, and for the most part somewhat smaller than the others. The second species are of a light brown colour, and do not confine themselves to the summits of the mountains; but likewise resort to the woods and thickets in the vales.

The marmouset is a kind of badger, and towards winter grow so exceeding fat as to weigh twenty pounds, by which means they become an easier prey to the peasants and hunters. They burrow either in the earth, or under a rock.

Among the Alps are likewise found a species of hares, which in summer perfectly resemble other hares, but in winter become all over white, in so much that they are scarce distinguishable among the snow. Here are also yellow and white foxes in great numbers, which in winter come down to the valleys.

Among the birds, the most remarkable is the lammergeyer, which delights in the highest peaks, and resembles a large eagle, of so prodigious a size, that its wings frequently extend fourteen feet: it preys alike upon wild and tame animals. There are also several sorts of fowls fit for eating, as the moor-cock, the rail, the snipe, the partridge, and some others.

S E C T. II.

Of the Persons, Dress, Manners, and Customs of the Swiss; their Magazines for Corn; their Management of their Cattle; the Populousness of the Country; their Languages, Religions, and the Unanimity that generally prevails amongst them: with the Sciences, Manufactures, and Coins of Swisserland.

THE Swiss are generally tall, well made, strong, and laborious; they are distinguished by their honesty, their steadiness in their resolutions, and their bravery. It is the principal endeavour of the several cantons to preserve the greatest plainness and simplicity of manners, and to banish from among them every thing that has the appearance of pomp or superfluity; for should dressing, feasting, and balls, once get among the cantons, their military roughness would be soon lost; their tempers would become too soft for their climate, and their expences exceed their income; and, as the materials of luxury must be brought from other nations, they would soon ruin a country that is not over-stocked with money. Hence every thing is prohibited that may introduce vanity and luxury. Besides the several fines set upon plays, games, balls, and feasting, they have many customs which greatly contribute to the preservation of their ancient simplicity.

The citizens, at the head of the government, are obliged to appear at all their public assemblies in a black cloak and a band. The dress of the women is extremely plain, those

those of the first quality generally wearing nothing on their heads but furs, which are to be had in their own country. Indeed, persons of different ranks of both sexes are allowed their different ornaments; but these are far from being expensive, and are merely marks of distinction. Thus the chief officers of Bern are known by the crowns of their hats, which are much deeper than those worn by people of inferior rank. The peasants are usually clothed in a coarse cloth manufactured in the country; while their holiday cloaths descend from father to son, and are seldom worn out till the second or third generation; so that it is not very uncommon to see a countryman in the doublet and breeches of his grandfather.

As these little states abound more in pasturage than in corn, they are all provided with public granaries, and in exigencies, where the scarcity is not universal, have the humanity to assist one another. The administration of affairs relating to the public granaries being much the same in every particular government, it will be sufficient to give the rules observed in these respects by the little commonwealth of Geneva. Three of the little council are deputed for this office, and obliged to keep together a sufficient quantity of provisions, to last the people in case of war or famine at least two years. Their magazines must be filled in times of the greatest plenty, in order that they may afford to sell cheap, and increase the public revenue at a small expence to its members. Besides, that the three managers may have no temptation to pay too great a price out of the public treasury, or to impose upon the public by purchasing bad corn, none of them must, upon any pretence, furnish the granaries from their own fields; and that the filling of the magazines may not prejudice their market, and raise the price of provisions at home, they must buy no corn within twelve miles of the city. In short, that such a quantity of corn may not spoil by keeping, all the inns and public-houses are obliged to furnish themselves out of it, by which means the most considerable branch of the public revenue is raised. The corn being sold out at a much dearer rate than it was bought up, the principal income of the common-wealth, which pays the pensions of most of its officers and ministers, is raised on travellers, or such of their own body as have money enough to spend at taverns and public houses.

The inhabitants derive their principal subsistence from the grazing of cattle, which is here very profitable; both the valleys and the middle part of those enormous mountains the Alps, yielding excellent fodder. White meats are the usual food of the peasants, and such as labour in the mines. In the beginning of the summer their cattle are driven up among the Alps, and there committed to the care of persons stiled Senns, who pay them a certain sum for keeping them. The Senns on all the Alps likewise keep hogs, which are fed with the whey after making two sorts of cheese and butter; and these people also drink this whey themselves. The Swiss cheese is much esteemed in other parts of Europe; but the best is that of Berne and the canton of Freyburg. Great numbers of horses are likewise bred here, which are bought up for the French cavalry.

Swisserland is more populous than foreigners generally imagine, the women being remarkably prolific; yet in several provinces there is not so much as a single town, and in the whole country little more than a hundred. The Protestant cantons are better inhabited, and more wealthy, than the Popish, which is owing to the celibacy occasioned by the number of convents for both sexes. The number of inhabitants is computed at two millions, and these are divided into three classes; the nobility, the burghers, and the peasants. D. Zimmermann, in his Essay on National Pride, maintains that in Swisserland self-murder is more common than even in England.

In Geneva and Swisserland it is customary to divide their estates equally among all their children, and thus every one lives at his ease, without becoming dangerous to the republic: for an overgrown estate no sooner falls into the hands of one who has many children, than it is divided into so many parts, that though it renders the sharers of it rich enough, they are not raised too much above the level of the rest. In these little republics this

is absolutely necessary; for as the rich merchants are obliged to live much within their estates, they might, by heaping up vast sums, become formidable to the rest of their fellow-citizens, and destroy that equality which is so necessary in these kinds of governments.

The inhabitants in general speak German, and in this language all their state and public affairs are transacted, as also those in the republic of the Grisons and the Valais. In a part of the town of Freyburg, and its dependencies, with those of Bern and the city of Geneva, the principality of Neuenburg, the Upper and Lower Valais, the tythings of Syders and Sitten, the French is used; but it is generally only the Patois, or a bastard sort. In several districts of the Grisons they speak the Chur Italian, with this difference, that in some places it borders on the Latin, and is accordingly termed Ladinum, while in others it has no small affinity with the Italian. Indeed in many places the Italian language prevails; but in each with different degrees of purity.

The two prevailing religions are the Calvinist and Popish; the former is professed by four cantons, five annexed places, and three governments: the latter is established in seven cantons, three incorporated districts, twelve governments, and the like number of protected places. In two cantons among the Grisons, five governments, and two protected places, both religions are on an equal footing. Each town, place, and state, has its own particular constitution, for the management of its churches, schools, and other ecclesiastical affairs.

"I have often considered, with a great deal of pleasure," says the ingenious Mr. Addison, the profound peace and tranquility that reigns in Swisserland and its alliances. It is very wonderful to see such a knot of governments, which are so divided among themselves in matters of religion, maintain so uninterrupted an union and correspondence, that no one of them is for invading the rights of another, but remains content within the bounds of its first establishment. This I think, must be chiefly ascribed to the nature of the people, and the constitution of their government. Were the Swiss animated by zeal or ambition, some or other of their states would immediately break in upon the rest; or were the states so many principalities, they might often have an ambitious sovereign at the head of them, that would embroil his neighbours, and sacrifice the repose of his subjects to his own glory."

The sciences are cultivated in Swisserland with an application equal to that of any other nation, and the many eminent scholars it has produced are illustrious proofs of the genius of the inhabitants. There are many good foundations for the instruction of youth, especially among the Calvinists, who, besides the gymnasiums and schools in many places, have academies at Zurich, Bern, Lausanne, and Geneva, with the celebrated university of Basil. The Papists have also several gymnasiums and a Jesuits college at Lausanne. The Calvinists have likewise literary societies for the improvement of the German tongue at Bern, Zurich, and Basil: others apply their attention to the cultivation of the sciences, among which is the Helvetic society at Basil, and the æconomical society at Bern. Some Swiss have also distinguished themselves in the fine arts, and the number of masterly painters this country can boast may be seen in the Lives of the Swiss Painters, published at Zurich in 1755. This country has also produced some excellent engravers.

Swisserland has a great number of manufactures. In those parts that produce tobacco, that plant is prepared both for smoking and snuff. Great quantities of flax and hemp are spun into thread of different fineness, for the weaving of linen. Thread, lace, and stockings, are likewise made here; and Winterthur is noted for its neckcloths for men and women. Among its linen manufactures are its dimities, cotelines, limoges, and trieges. Cotton is spun and wove into muslin and stuffs for gowns; into handkerchiefs, stockings, and gloves. Cottons are also printed with figures of the most beautiful colours. In Swisserland are made several sorts of silks, particularly paduasoy and organzines, gold and silver brocades, velvets, handkerchiefs, ribbons, and stockings. Its woollen manufactures are druggets, calamancoes, fatts, damasks, camblets, ratines, flannels, blankets, lindsley-

lindsey-woolsey, and stockings. Bleaching and dying are likewise performed in the best manner. The other manufactures are those of hats, coarse and fine paper, leather for all uses, particularly the Neuenburg chamois, and the Schwitz calf's leather, are particularly famous. Horn is worked into a variety of utensils. Winterthur and Lausanne are famous for their earthen-wares, particularly for their beautiful white and painted stoves; and several places make a very pretty porcelain. The marble of this country is sawn and polished at home; but the greatest part of the beautiful crystals met with here are carried to Italy. Their gold and silver manufacturers deal in laces, fringes, &c. and the best gold-beaters are those of Basil. Several places trade largely in toys; neat and good watches are made here, and Swisserland is not without skilful printers, braziers, founders, cutlers, &c.

The situation of this country between Germany, France, and Italy, with its navigable lakes and rivers, particularly the Rhine and the Rhone, by which it has a communication both with the German ocean and the Mediterranean, together with droves of pack-horses for the conveyance of goods over the mountains, where no carriages can pass, render the trade of this country very extensive. Its principal exports are cheese, butter, horses, horned cattle, sheep, some wine, and several of the above manufactures. On the other hand, this country imports grain from Swabia, Tirol, and Alsace, as also hemp and flax; with wine, wool, salt, several species of manufactures, and particularly American and Asiatic goods.

The coinage in all the cantons and incorporated states is not alike: Zurich, Basil, Schaffhausen, and St. Gall, follow the standard of Germany; while Bern, Lucern, Uri, Schwitz, Unterwald, Zug, Freyburg, Solothurn, Geneva, Neuenburg, and the Valais, keep to the old Burgundian standard.

The lowest coin here, according to Dr. Busching, is the heller, or haller, which is the sixteenth part of a penny, two of which make a pfenning, or angster; Zurich coins drey hallerlins, or three hallers; and Bern dreyerlin, or vierer. Another small piece here is the rap, six of which go to a plapper, and ten to a batz, and fifteen of the last make a Swiss guilder. Six angsters are equal to a Zurich shilling, seven hellers to a kreutzer, and four hellers to a Bernlander, or Chur batz. Bern and Zug have likewise their half kreutzers; Zug, Freyburg, and Solothurn, coin three kreutzer pieces; and Bern some of ten and twenty. The batzes are of three sorts; the good, which are coined at Schaffhausen, are of the value of sixteen pfennings; the Zurich batzes are equal to fifteen pfennings; and those of Berne to fourteen: there are also half batzes. A gemein gulden usually passes for fifteen good batzes, and sixteen Zurich batzes; a Bern gulden for fifteen Bern batzes, or thirty-six Zurich shillings; and a lander for thirty-two. In the country of the Grisons seventy blutzgers, or thirty-five Zurich shillings, make a gulden. The gold coins here are whole, half, and quarter ducats.

SECT. III.

The History of Swisserland; with a general Account of the Regulations with respect to the thirteen United Cantons in general: the Titles by which they are addressed by foreign States, their military Establishments, and the Contingents of each State; with the Regulations with regard to such of their Troops as enter into the Service of foreign Princes.

THE antient Helvetians were a Gaulish or Celtic people, and Helvetia, which received its name from them, was divided into four cantons or territories. Julius Cæsar was the first who reduced the inhabitants under the dominion of the Romans, who founded colonies here; and their dominion continued till the fifth century, when the country was over-run by the Burgundians and Germans, and at length became united to the German empire; but about the year 1300 the emperor Albert I. not only refused to confirm their antient privileges, without condescending to alledge any reason for his refusal, but set over the Swiss two noblemen of the

most infamous characters for avarice and arrogance, whose administration becoming insupportable, the people addressed their petitions and complaints to the emperor, but without success.

This so encouraged their tyrants, that Griser, the governor of Unterwald, set his hat upon a pole at Altoiff, and, in the wantonness of power, demanded that the same respect should be paid to it as to himself. The histories of Swisserland say, that one William Tell refusing to submit to this mark of slavery, Griser had him brought before him, and telling him that he heard he was an excellent marksman, commanded that he should shoot an arrow at an apple placed upon his own son's head; and that if he missed it, he should be hanged. Tell, though with a trembling hand, struck off the apple without touching his son, and thereby saved his life; but Griser perceiving that Tell, though he was to have but one shot, had an arrow in his belt, demanded the reason; on which he frankly confessed, that had he been so unfortunate as to have killed his son, he would have shot it at him. The tyrant, who had promised to give him his life on his acknowledging the truth, now ordered him to be bound and carried prisoner for life to a place on the lake of Lucern; but Tell happily escaping out of the boat in crossing the lake, retired into the mountains, where he waited for an opportunity of destroying the tyrant, and at length shot him as he was passing along the road.

The people now universally expressed their hatred against the tyrants, and the inhabitants of Uri, Schwitz, and Unterwald, who had from time immemorial possessed the right of being governed by their own magistrates, with other important privileges, united in order to defend themselves to the last extremity. For this purpose they chose three commanders, gentlemen of approved courage and abilities; these were Gerhard Stauffach, Walter Furst, and Arnold Melchthal, who secretly agreed to surprise and demolish the castles in which the imperial governors resided.

This resolution being effected, these three places joined again in a league for ten years, which gave birth to the Helvetic confederacy. The emperor Albert thinking this a proper time for totally reducing these places by force of arms, hastened to Baden to begin the preparations; but being on his return murdered by John of Hapsburg, the design was dropped till the house of Austria invented another pretence for falling on the United Cantons. These and other parts of Swisserland adhering to the emperor Lewis of Bavaria, Frederic of Austria, his competitor, was so extremely irritated, that he put the inhabitants of Schwitz under the ban of the empire, because during their contests with the abbey of Einsidlen, they had made some of the monks prisoners; and they were excommunicated by the bishop of Constance. Soon after Leopold, duke of Austria, in 1315, attacked the Confederates with an army of twenty thousand men; but was defeated at Morgarten, in the canton of Schwitz. Upon this, on the eighth of December, in the same year, they entered into a perpetual alliance, which proved the origin of the present Helvetic confederacy. In 1332 Lucern acceded to it; in 1351 they were joined by Zurich and Glaris; and in 1352 their number was increased, by their being joined by Zug and Bern. For the space of 125 years this confederacy was composed only of these eight cantons; but in 1481 Freyburg and Solothurn, and in 1501 Basil and Schaffhausen, were admitted into the confederacy; and in 1513 Appenzel also acceded to it.

The federal union, however, extends no farther than is necessary for their mutual defence, and accommodating differences that may arise between two or more towns or cantons, and in all other affairs they are left to their liberty, particularly with respect to concluding alliances with foreign powers, their granting auxiliaries, receiving subsidies, permitting a passage to foreign troops, and also in their transactions among each other; as the sending of envoys to foreign states, adjusting the value of their coins, or calling them in, and other matters of public concern, though, both in their foreign and domestic affairs, great pains are taken to produce an unanimity of opinion, in order to add the greater weight to their resolutions. Besides, every town and canton is an independent

*W.^m Tell's bold Answer to the Tyrant, after having
shot the Apple from his Son's Head.*

independent state of itself, enjoys the privilege of modelling its own form of government; and of making laws, without any obstruction from the other members of the confederacy.

Thus the whole Helvetic confederacy properly consists of thirteen distinct republics, or free states, united by oath for their mutual security and defence. It has now for some centuries supported itself in an absolute freedom and independency; increased all the privileges of majesty; made wars, concluded treaties, received and sent envoys from and to the several European powers; entered into alliances with them; given what form they thought proper to their constitution; enacted laws and ordinances, both in temporal and spiritual affairs; and exercised all the various prerogatives of sovereignty.

Accordingly, at the peace of Westphalia in 1648, it was acknowledged to be a free state, even by the emperor and empire. The former gives it the title of "The most valiant, firm, and full of dignity, our best beloved friends the common confederates of all the thirteen cantons and other places of Swisserland." The French king addresses them in the following manner, "To our very dear and great friends and confederates the burgomasters, advoyers, landammen, and council of the Swiss league in Upper Germany." The king of Great Britain styles them, "The illustrious and most mighty lords, the consuls, seneschals, landmen, and senators of the confederated Swiss cantons, our very dear friends." The king of Sweden styles them, "The noble, most mighty, magnificent, and renowned people, our dearly beloved friends, consuls, seneschals, landammen, senators and communities of the thirteen confederated Swiss cantons." The king of Prussia writes to "The high born, noble, most firm, wise, and very learned, our singularly beloved friends, of all offices and other posts of honour, the burgomaster, prætor, bailiffs, and council of the thirteen confederated cantons of Zurich, Bern, Lucern, &c." And the pope's address to the catholic cantons runs thus: "To our beloved sons the prætors, landammen, &c. the counsellors of the eight Swiss cantons; that is to say, of Lucern, &c. the defenders of the faith." The United Cantons in rank are reckoned next to Venice. To them belong in common twenty-one bailliages, two towns, and the like number of lordships. Eleven other free Helvetian republics are united, either with the whole confederacy, or with particular states.

The form of government in the states of the Helvetic republic is in some monarchical, in others aristocratical, and in others again democratical. Their sovereigns are the princes of the empire, as the bishop of Basil, and abbot of St. Gall. The aristocratical governments are the cantons of Zurich, Basil, and Schaffhausen, with some incorporated places, as the towns of St. Gall, Muhlhausen, and Biel, which are governed by six burgomasters; the cantons of Bern, Lucern, Freyburg, and Solothurn, over which are appointed justiciaries; and Neuenburg and Geneva, where the supreme power is lodged in bailiffs. The democratical form of government prevails in the six cantons of Uri, Schwitz, Underwald, Zug, Glaris, and Appenzell, which are under the direction of landammen, and also with some variation in the eight acceding places, as the Grisons and the Valais; but in all of them every male from sixteen years of age has a vote.

The revenues of the states are the usual imports, tythes, annual incomes, payments annexed to the sovereignty, and their subsidies.

With respect to their military establishment, the only regular forces are those of the garrisons of Zurich, Bern, Basil, Geneva, and Arburg; but every burgher, peasant, and subject, must exercise himself in the use of arms; appear on the stated days for shooting at a mark; furnish himself with proper cloathing, accoutrements, powder and ball; be always ready for the defence of his country, and punctually comply with every article of war. For this end almost every canton, particularly those of Zurich, Bern, Basil, Freyburg, and Solothurn, have classed their subjects into regiments of horse and foot under the command of proper officers, who are composed of the burghers of the several towns.

According to several ordinances, and the conventions for the common defence and immediate assistance of any injured party, the contingents of the several cantons are as follow:

	Men.
Bern	2000
Zurich	1400
Lucern	1200
Uri	400
Schwitz	600
Underwald	400
Zug	400
Glaris	400
Basil	400
Freyburg	800
Solothurn	600
Schaffhausen	400
Appenzell	600

Total	13,400

Besides which, each canton and incorporated district is to have in readiness one field-piece, with all other implements, powder, ball, &c. that on the first notice their succours may be sent without delay. Also every confederated and incorporated district, for the second and third draught, is to furnish and hold in readiness double the same proportion. Such towns and territories as levy cavalry are also immediately to march.

Thus, as in the Seven United Provinces of the Netherlands, the weak are defended by the strong, and those who can send at one time only one or two hundred men, are generously protected by those who are willing to send as many thousands; and all are mutually engaged in one common interest, in the defence of their liberties and their respective laws. Happy would it be for mankind in general, were all its princes united by a like confederacy!

The above corps, composed of the troops of all the different cantons, form two armies, one consisting of the troops of Zurich, Lucern, Schwitz, Zug, Basil, Solothurn, Appenzell, the town of St. Gall, the Thurgau, the Free Bailliages, Sargans, and Lauwis: to the other belong those of Bern, Uri, Underwald, Glaris, Freyburg, Schaffhausen, the abbey of St. Gall, Biel, Baden, the Rhein Vale, Luggaris, Mendris, and Mayenthal. Over the first of these armies the towns of Zurich and Lucern nominate each a commander in chief; Schwitz and Zug, each a major-general of the artillery; Solothurn, a quarter-master-general; Appenzell, a provost-marshal; and the town of St. Gall, a waggon-master. In the latter, the two commanders are appointed by Bern and Uri; the two major-generals, by Underwald and Glaris; the general of the artillery, by Freyburg; the quarter-master-general, by Schaffhausen; the provost-marshal, by the abbot of St. Gall; and the waggon-master, by Biel.

Any territory in visible danger of an attack or surprize by the enemy, may claim from the next territory all the three draughts collectively, and this territory again is to demand succour of the next; and so on, each being obliged to march its contingent to the rendezvous. For the more expeditious assembling of these armies, signals are ordered to be made on the mountains and high places.

Swisserland is well provided with arsenals, particularly at Bern; but the only fortified places are Geneva, Solothurn, Zurich, Bern, Basil, and Arburg.

The Swiss engage in the service of foreign princes and states, either merely as guards, or as marching regiments.

In the latter case, the government permits the enlisting volunteers, though only for such states as they are in alliance with, or have entered into a previous agreement on that article; and no subject is to be forced into foreign service, nor even to be enlisted without the concurrence of the magistracy. All the advantages arising to these regencies from these levies are usually an annual subsidy, paid by the state in whose favour the levies are granted, and perhaps a promise of reciprocal aid when necessary. A public benefit, however, attending this custom is, that these men, on their return home, after a long service abroad, greatly improve the standing militia of the country. The greatest number of Swiss troops is kept by France.

In order to give a more particular description of the several parts of Switzerland, we shall begin with the thirteen cantons, and afterwards shall add the incorporated territories.

SECT. IV.

Of the Canton of ZURICH.

Its Situation, Extent, and Produce: a Description of the Lake of Zurich; and of the City of the same Name.

ZURICH is bounded on the north by Swabia and the county of Schaffhausen, on the east by Thurgau and the county of Tockenbourg, on the south by the canton of Schwitz, and on the west by the canton of Zug and the Free Provinces.

This canton is, according to the learned Scheuchzer, an epitome of all Switzerland, as containing hills, valleys, plains, corn lands, vineyards, lakes, rivers, vegetables of all kinds, and whatever else is necessary to the support of life. Grain is cultivated all over the country; but it ripens later in the mountainous parts, where the air is coldest, than in the sandy valleys. The hilly grounds on the east, west, and south borders, afford a specimen of the fertility of the Alps, as abounding in cattle, milk, butter, and cheese; and towards Schaffhausen and the Thurgau the country produces good wine, which, tho' at first tart, improves by keeping, and after some years becomes smooth, pleasant, and wholesome. Fruits are also found every where in great plenty. The most remarkable minerals and fossils are, the fine white chalk at the village of Mur, different kinds of clay for making earthen-ware, pit-coal, and turf; and in several places are veins of sulphur.

The principal lake in this country is that of Zurich, which is one of the largest in Switzerland, it being twenty-four miles in length, and about three in breadth. The prospect from it is extremely delightful, the little eminences by which it is bordered being all over diversified with corn fields and vineyards, and behind these is every where a gradual ascent of larger hills terminating in the stupendous mountains of Glaris, Schwitz, and the Grisons, whose summits are always covered with snow. The Rhine waters the north side of this canton, where it is joined by the Thur, the Toss, and other smaller streams. Out of the lake of Zurich issues a river which flows through the town, and having a little below it received the Hill, begins to be called the Limmat; till traversing the county of Baden, it at last loses itself in the Aar.

This canton is, next to Bern, the largest and most populous, it being thought capable of bringing near fifty thousand fighting men into the field, without any considerable detriment to its agriculture or manufactures.

The Reformation was begun here by Zwinglius, in 1517, in the city of Zurich, and in 1524 spread through the whole canton. Religious affairs are under the direction of an ecclesiastical council composed of eight members, two of whom are clergymen, and of a synod of ten deaneries, including under them a hundred and fifty ministers.

On the accession of this canton in 1351 to the perpetual alliance with Uri, Schwitz, Underwald, and Lucern, the latter, on swearing to the alliance, made no difficulty of yielding the presidency to Zurich, which

it has since constantly retained; but this honour, instead of being any real advantage, is rather a burthen, all affairs relating to the collective body of the confederacy being transacted in its offices, and from thence communicated to the other towns and places.

The city of Zurich, the Tigurum Thuricum of the ancients, is seated in the forty-seventh degree fifty-four minutes north latitude, and in the eighth degree thirty-two minutes east longitude, in a very pleasant and fertile country on the outlet of the lake, and is esteemed the handsomest town in Switzerland. It is large and well fortified, and contains five arsenals, which are well stored. Its churches are the Great Minster, which has prebends; the Frau-Minster, a parochial church; but the largest ecclesiastical foundation before the Reformation was an abbey for ladies, the abbess of which bore the title of princess. To these are to be added St. Peter's and the Prediger church. There is here an academy, which has fifteen professors, with two colleges. Here is also a German society, which owes its origin to professor Bodmer, and is associated with that of Bern. The town-library, which is very considerable, with the public museum, are in the Water-church. In the prebend-library are several valuable manuscripts. The town-house is a very fine pile of building, and so well designed, that it would make a good figure even in Italy. The frontispiece to this edifice has pillars of a beautiful black marble streaked with white, which is found in the neighbouring mountains; and the chambers for the several councils, with the other apartments, are very neat.

The burghers are divided into thirteen companies, the first of which is chiefly composed of gentry. Out of these companies are chosen the city regency, that is, the greater and lesser council, in whom the sovereignty and administration of all civil and military affairs are lodged. The great council consists of one hundred and sixty-two members, and to this assembly none can be admitted under thirty years of age. The lesser council is composed of fifty members, who must all have attained their thirty-sixth year, and is divided into two equal bodies, each of which is alternately possessed of the regency for the term of six months.

The principal persons in the city are two burgo-masters, freely elected by the burghers and counsellors from the above councils, and these hold the government by turns, each for half a year. Next to them are four stadtholders, or masters of companies, and two treasurers, who continue in office twelve years by annual rotation. The privy council is composed of twelve members, who are the two burgomasters, the four stadtholders, two treasurers, the obman of the convents belonging to the public, and three others elected by the counsellors. In this assembly the affairs of the canton are first discussed, and if thought necessary, they lay them before the lesser and greater councils. The chamber of accounts consists of twelve members; these are the two burgomasters, one stadtholder, two treasurers, the obman of the convents, three members of the lesser, and three of the greater council. These inspect the city receipts and disbursements, the accounts of the treasurers and city builders excepted, and likewise take cognizance of the tithes. The council of reformation is composed of eight members of the lesser, and four of the greater council, and superintends the execution of the sumptuary laws, the reformation of manners, defamatory expressions, and acts of violence. To the marriage court belong eight members, who determine all matrimonial disputes, and inflict punishments on all persons convicted of whoredom, prohibited games, swearing, superstitious practices, profanation of the sabbath, and the like. The city court hears causes relating to debts and pecuniary claims; and the revenue court decides contests in matters under its jurisdiction. To the above-mentioned obman of the convents is committed the management of the church revenues, both in the city and country.

Zurich has all the manufactures that are to be met with in the most ingenious and flourishing nations, as cloths, stuffs and linen crapes, calamancoes, half silk and half worsted cipers, calicoes, silk handkerchiefs, fattins, organsines, and several other sorts of silks; silk stockings,

stockings, cotton stockings, muslins, lawns, gold and silver thread, and galloons; besides a foundery for bells, cannon, and other things.

The arms of the city of Zurich are, a shield argent and azure, party per bend.

S E C T. V.

The Canton of BERN.

Its Situation, Extent, Produce, Rivers, Lakes, Mountains, and Vallies. The military Affairs of the Canton; with a particular Description of the City of Bern, and its Government; the Welschen or foreign Lands, and also a Description of Lausanne.

BERN is terminated to the east by the cantons of Uri, Unterwald, and Lucern; to the northward by the Austrian forest towns, and the cantons of Basil and Solothurn; to the westward it borders on the canton of Solothurn, the district of Biel, the principality of Neuenburg, Franche Comté, and the land of Gex; and to the southward on the lake of Geneva, the dutchy of Savoy, and the Valais. It pretty nearly environs the whole canton of Freyburg, extending about a hundred and fifty-one miles in length, and seventy-five in breadth, it being the largest of the thirteen cantons, and forming in the whole little less than one-third of the confederacy.

Scheuchzer styles this canton, with respect to its extent, figure, and fertility, the most valuable gem of all Switzerland. The levels yield an exuberance of grain and fruit, and the high lands afford rich pastures covered with cattle; whence the inhabitants are in no want of milk, butter, and cheese. The finest spots here are in the country bordering on the lakes of Biel, Neuenburg, and Geneva, which not only yield the choicest fruits, but also excellent wine. Here is clay of different colours, of which earthen-ware is made. In this canton is also found mundic, with a beautiful blue and white sandstone, used at Bern for building. There are here also gypsum, pit-coal, sulphur, and iron ore. Some gold is likewise found among the sands of the Emmat and the Aar. The latter of these rivers is the largest in the whole canton, and has its source within it, receiving the larger Emmat, the Sanen, the Sensen, the Wigger, the Aa, the Hufs, and the Limmat, and at length loses itself in the Rhine. The Candel, or Cander, is an impetuous torrent that issues from the Gaster Alp, being joined by the rivulet of Alp, and afterwards by the Simmen, whence it continues its course through a new canal three thousand feet in length, in the making of which an eminence a hundred and fifty-two feet high was levelled.

Among the lakes the principal is that of Geneva, the greatest part of which is within this canton, and which we shall describe in treating of Geneva.

To this canton likewise in some measure belong the lakes of Neuenburg and Biel, the latter of which is also called the Nydaw lake, and is very full of fish: it receives into it the Thiele, which issues from the Neuenburg lake. The borders of this lake are fruitful; they are planted with many vineyards, and almost in its center are two small islands, the largest of which, called St. Peter's, is a delightful spot covered with meadows, vineyards, and the most beautiful woods.

The Simmenthal, or Simmen Vale, in this canton, says Dr. Busching, extends between twelve and thirteen hours in length, with a breadth of only one quarter or a sixth, and is on both sides bounded by a ridge of high mountains, of equal length, but of very different quality, some of them being extremely fertile, and others barren, while others again are merely bare rocks. The rivulet of Simmen, or Siemen, which traverses the whole length of the vale, is said to have a seven-fold source, and from this circumstance to derive its name, which it has since communicated to the vale. The stupendous height of the rocks, whence vast fragments frequently fall into the road, render the entrance into the vale somewhat frightful, especially during the spring, when, by the dissolution of the ice and snow, whole masses of rocks separate

from each other, and render it really dangerous. In this long valley are several villages; but the inhabitants in few places sow either wheat, oats, or rye; they receiving great profit from their grass, which is extraordinary rich, breeding vast numbers of cattle, from which they obtain milk, butter, and cheese. The best sort of the latter, which is made of cream, is in great repute abroad, under the name of Saan cheese. The greatest part of the inhabitants, instead of bread, eat thin barley-cakes, with the second sort of cheese; but the principal food of the common people is potatoes, and they drink milk or whey: but the more wealthy have wine, which is of a high price, it being brought over the mountains from Vivis. Some parts produce good fruit, and the rivulets abound both with red and common trout.

The territory of Hafsli, which is also in this canton, according to the above author, extends about eleven hours from the summit of the Grimsel hill. In the upper valley are fine woods of beech and pine, with plenty of grass for cattle, both on the heights and low lands. The mountains yield most excellent roots, and are frequented by chamois goats, and other animals that resort to the mountains; as also by wild fowl of all kinds. This country likewise abounds in mines, particularly in those of lead and iron, as also in fine crystals.

Over the high mountain called the Grimsel hill is a road leading to Upper Gestelen in the Valais, that is passable only in summer; and even then, on account of the ice and snow, is very difficult, troublesome, and dangerous, and is with great labour and expence kept in repair by the inhabitants of the Hafsli vale. In many places this road is hewn out of the hard rock in a serpentine form, secured with walls, and connected by bridges that extend from one rock to another; and on the top of the road towards the north is a lake. On this road, at the foot of a hill, is an inn or hospital, where every five years the land-holders of the Hafsli vale appoint an hospitaller, as he is styled, who continues there from the middle of March to Martinmas, that is, as long as the road is passable, and accommodates travellers with meat and drink, for which those pay who are able, but the poor are entertained gratis. The expence is defrayed by an annual collection made throughout the whole confederacy, and even in some places beyond it.

Southward from the hospital an ice vale extends two hours in length, and afterwards for six hours more winds to the west with the mountains, terminating at last at the high ice-mountain of Schreckhorn; and in this vale, which is called the Grimselthal, lies the source of the river Aar, or Aren. On a part of the Grimsel hill, called Zinkenbergr, a crystal-pit was discovered in 1719, which yielded crystal to the value of upwards of thirty thousand rixdollars; many pieces dug in it weighing from four to seven and eight hundred pounds, most of which were without flaw, and as transparent as water.

The canton of Bern is well cultivated and very populous, containing thirty-nine large and small towns, and above thirteen villages, with about four hundred thousand persons. The German is the prevailing language in the greatest part of the canton; but in the Foreign Lands, as they are called, the French is mostly used.

The whole canton is Protestant, except a few Papists, who reside in the Vale of Frick. The churches of the German territory of Bern are ranged under six chapters, each of which has a dean, who is appointed by the daily council of Bern, and also a treasurer assisted by certain jurats; and these, every year, in conjunction with such officers of the bailliage as live within their department, hold a chapter or synod.

In the year 1353 the city of Bern concluded a perpetual union with Uri, Schwitz, and Unterwald, and thus became a member of the confederacy. One article of this union was, that Bern should likewise assist Zurich and Lucern, when required by the three above-mentioned cantons, as allies of those states, and, at the request of those cantons, Zurich and Lucern were also to assist Bern. This canton, on account of its power and opulence, has been allowed the second rank among the confederates.

Its arms are gules, a bear sable, rampant, on a bend or.

The military affairs of this canton are under the care of a war-office, instituted in the capital. This office appoints the musters, and also the majors who conduct them; gives orders in every thing relating to the furniture and discipline of the militia, and also the implements of war. Every male from sixteen to sixty is entered in the war-roll, and about one-third of them divided into regiments under the title of fusiliers and aufzugers, who are recruited from the other two-thirds. The fusiliers are all single, picked men; but the aufzugers are married. In time of war both serve, but the first draught is made from the fusiliers. A regiment of these, including the staff-officers, consists of two battalions, each containing five companies, and to every company are a hundred and ten men, including ten commission and non-commission officers; but of the aufzugers, a regiment consists of twelve companies, each containing two hundred and eighteen men, thirteen of whom are officers.

Every person when entered on the roll is to provide himself with arms, which, as well as the cloathing, are to be all uniform. The colour universally used is brown, and the distinctions between the regiments consist entirely in their facing. Among the horse is a regiment of cuirassiers, who are furnished by the vassals in the Païs de Vaud and the Walschen lands: the rest of the horse, one troop of curiaffiers excepted, who are burghers of Bern, consist entirely of dragoons. Every regiment contains ten troops, making in the whole five squadrons, who all find their respective horses, arms, and accoutrements; on which account those who keep horses are generally chosen for the cavalry.

That the men thus distributed into regiments, and the others also may be provided with arms, and be rendered expert in the use of them, commissaries at arms are stationed all over the canton for mustering and exercising the people in every department throughout the year, and for seeing that all their arms and accoutrements are in good order. The country is also divided into certain districts, each under the direction of a land-major, who receives pay from the states, and is to see that the soldiers are kept in constant readiness to march. This officer frequently makes a progress for the inspection of the officers and private men, and every year brings those of his circuit to a general muster.

A commander in chief is never appointed but in time of war, and even then he is assisted by a council composed of the most eminent members of the regency and other experienced officers, without whose concurrence he can undertake nothing, but with their approbation any thing. As in such cases several different corps are necessarily put in motion, so each has a commander and counsellor at war. During a peace the president of the war-office at Bern is the first military officer.

Though the grand train of artillery be kept in the arsenal at Bern, yet a considerable number of field-pieces are distributed all over the country, especially at the mansion-houses and castles where the governors and prefects reside. To this artillery belong three companies of matrosses, and one of bombardiers, each consisting of one hundred men, under their proper officers; and every district knows the horses and carriages it is to furnish for the artillery, stores, and baggage. There is also a company of a hundred and twenty men, composed of various artificers, for adjusting and repairing the artillery; as also another of guides, with its officers. These last are always composed of such as are thoroughly acquainted with the roads, bye-ways, and different parts of the country.

In time of peace the only force constantly kept up is a guard in the city of Bern, consisting of two hundred men, commanded by a town major, who is always a member of the great council, and three lieutenants, with seventy-five men, and three non-commissioned officers included, as a garrison for Fort Arburg.

For the better regulation of levies to be made for any foreign power, Bern has a particular office called the recruit-chamber, the commissioners of which consist of two members of the daily council, and five of the great council. From this office licences for such levies are issued, and here the recruits make their appearance and are registered.

The prefects over the countries subject to Bern reside, while in office, in their several departments, and have their deputies, clerks, and collectors. In civil causes they sit as judges in the bailliage courts; but from them appeals lie to the court of appeals at Bern. They punish petty crimes, and in greater ones draw up the indictments and form the process, which being transmitted to the lesser council at Bern, sentence is there passed, but the execution is referred to the prefects.

The city of Bern, in Latin *Berna*, or *Arcotopolis*, is seated on the river Aar, which washes three sides of it, forming a peninsula. Down the river at the stone-bridge the peninsula is so narrow as to be reduced to a single street; but gradually widens along the side of an eminence three or four hundred paces in length, after which it is first divided into two streets, then into three or four, and lastly into five. On this eminence is a fine plain, both sides of which are watered by the Aar, which here flows in a deep channel, and on the top towards the west is fortified with walls, moats, and out-works. The houses, except those in the highest and lowest parts, with a few bye streets, are built of stone, particularly in the main streets, which are adorned with piazzas, neatly paved with square flags, for the convenience of walking dry in rainy or snowy weather. The streets, especially the high street which runs through the center of the city, are paved with flints; and the latter is so broad as to admit of two carriages a-breast on each side of the canal which runs through it. The banks of this canal are lined with free-stone, it passes through most of the streets, and makes sufficient amends for the expence of bringing it from a considerable distance, by its being, exclusive of other uses, of great service in case of fires, and very convenient for carrying off the soil of the town into the Aar.

What appears very extraordinary at Bern is their public walks by the great church. These are raised a prodigious height, and, that their weight might not break down the walls and pilasters which surround them, they are built upon arches. The ingenious Mr. Addison observes, that these walks being as high from the streets and gardens that lie at the foot of them, as most steeples in England, they afford the noblest summer prospect in the world; for they give a full view of a prodigious range of mountains that lie in the country of the Grisons, and are covered with snow. These are about twenty five leagues distance from the town, though their height and colour makes them seem much nearer. The cathedral stands on one side of these walks, and is a master-piece in Gothic architecture. The chief minister is the head of the city clergy, and bears the title of dean; and formerly this church had also its prebends. The inferior ministers and deacons belonging to it now officiate in the Dominican church, where was once a convent of monks of that order; but it is now divided into an hospital and house of correction, and the upper part of the choir being vaulted over, has been converted into a music-room for the *collegium musicum*. A French congregation has also its meetings in this church. The church on the Nydec stands at the lower end of the city, near the bridge over the Aar, and has a particular minister, with an assistant. The hospital of the Holy Ghost, which stands in the uppermost part of the city, has been made parochial, and provided with a minister and assistant.

There is here an academy, to which belong eight professors: it has three halls for public lectures, examinations, and other exercises, with apartments for a provost and twenty students in divinity, who are maintained gratis, and also a large public library, with a museum. There is likewise here a grammar school. Here is an oeconomic society, composed of men of letters. Under the town-hall is a large granary, and on the lower side stands the office of record. The arsenal is a very extensive building, in which, besides the artillery, are arms of all kinds for twenty thousand men. Here are shewn the figure and armour of the count who founded the town, and those of the famous Tell, who is represented at the head of the hall, aiming at the apple on his little son's head, who stands opposite to him: these are images of wood, in which the hands and eyes are admirably expressed. He appears to have been a tall raw-boned man, with a very honest countenance, and, according to the fashion

fashion of those times, one half of his coat is red, and the other black and yellow stripes alternately; his breeches and stockings are of one single piece, and an arrow sticks in his coat behind his head: the boy is laughing, as apprehending no kind of danger. They likewise shew abundance of arms, which they took from the Burgundians in the three great battles which established them in the possession of their liberties, and destroyed the great duke of Burgundy himself, with the bravest of his subjects.

The hospital is a very spacious structure, completely finished in 1742. The infirmary is another very large building.

This city is divided into four quarters, namely, those of the bakers, the butchers, the smiths, and the tanners, each having the privilege of chusing a knight-banneret. Besides these there are other companies; but it is the privilege of the former, that the four bannerets are chosen only out of those bodies.

The burghers of the city are divided into the qualified for government, and the perpetual inhabitants. The latter, consisting of such who were made freemen since the year 1635, enjoy all privileges; but are incapable of the magistracy, and all public employments, which are the peculiar portion of the former, as the descendants of those who were burghers before that year. Though the city was erected in the year 1191, as a check to the violent proceedings of the nobility, yet six very ancient noble families found means to be classed among the qualified burghers: these, besides being respected above all others, have this privilege, that when any of them are admitted a member of the senate or lesser council, he takes place of all other members, though his senior in office, and immediately follows the knights-bannerets, or tribunes of the people.

The great council, into which none is admitted under thirty years, is not to consist of less than two hundred persons; and when complete, their number amounts to two hundred and ninety-nine; but never to three hundred. This council makes war, peace, and alliances; manages every thing relating to the revenues, gratuities, aids, and buildings, above the value of one hundred rixdollars; chooses the lesser council, and nominates the several officers of the prefectures: the members also preside in all capital causes for crimes committed within the district of the city, and likewise in civil causes, when the sum in debate exceeds the value of five hundred pounds.

In the lesser or daily council, sit the two prætors, twenty-five council-men, among which are the four knights-bannerets, and the two treasurers. These meet every day, Sundays and holidays excepted, for the dispatch of all business, whether political, criminal, civil, or any other, that does not fall under the cognizance of the great council, or of any particular office.

The heads of the aristocracy are the two prætors, by the French called avoyers: their office is for life, and they act alternately every other year. The acting magistrate presides in the great and lesser council, dressed in a black robe, and sitting in a chair of state, somewhat raised; yet he is possessed of no vote, except in case of an equality, where he has the casting voice. However, on most occasions his opinion is asked. To his custody is committed the city seal, and by him all letters and other instruments are signed. The prætor out of office takes place next to the other, and, in his absence, acts as his representative, and is invested with the same marks of distinction.

Next to the prætors sits the treasurer of the German lands, who holds his place for six years, after which there must be an interval of four more before he can be a second time elected treasurer. His province is to elect and superintend the revenues of the several districts in the German lands, as also the stock belonging to the cantons in the English funds, for which he passes his accounts twice a year.

The knights-bannerets, who are the next in rank, precede all other members of the lesser council, and derive their title from their office of keeping the banners or flags of the four several parts of the town. These are empowered to see that the militia under their ban-

ner, have their arms in readiness. They are elected from the four above-mentioned tradesmen: no member of the daily council who is not free of those companies, can be made a banneret, nor can two bannerets be of the same company, each of the four having one of their own. They continue in office four years, but resign at the end of every year, that their election may be confirmed by a fresh choice. They are possessed of certain privileges in the legislature, and may stand candidates for any office not peculiar to the lesser council, and each of them is vested with the intendency of some districts, consisting of several villages about the city.

These are followed by the treasurer of the *Païs de Vaud*, which office is the most profitable of all.

The country governments of the cantons being very lucrative, used to occasion great struggles; so that to prevent disputes and cabals, it was ordered in the year 1711, that these and other posts of great profit should be disposed of by lot. The candidates first draw lots about their turns in drawing for the office; after which, as many balls as there are candidates are put in a bag. These balls are all silver gilt, except one with gold, which entitles to the government. This office is indeed held only six years; but is attended with such emoluments, that within that short space, they lay up thirty or forty thousand dollars. No batchelor is capable of this or any other profitable employment: unquestionably the scope of the ordinance was to promote marriage, and thereby good order and the increase of the subjects.

In the center of the city is a large stone seat encompassed with iron rails, on which sits the acting judge, and the two members of the council next to him, when any sentence of death is to be pronounced.

The commonalty of both sexes wear straw hats, and the women's coats come so near the arm-pits, that not above an hand's breadth is left for the shape. The peasants of the canton of Bern are the wealthiest in Switzerland, there being scarce a village without at least one inhabitant worth twenty, thirty, or even sixty thousand guilders. Within these sixty years the manners of the country are become greatly altered, and a fondness for show, pleasure, and sumptuous living, is increased in a manner unknown to their simple ancestors; yet many vices are neither so bare-faced nor so common as in other cities.

To the city of Bern belong many governments, each containing a number of villages, particularly the *Walschen Lands*, otherwise called the Foreign or Italian Lands, which were conquered by the city of Bern in the year 1536. It will be proper here to mention the city of *Lausanne*.

This city, which was antiently called *Lausodunum*, or *Lausonium*, is seated in a valley, at about the distance of half a league from the lake of Geneva. The city has several gentlemen's houses in it, that are tolerably well built, and very commodious, and is furnished with two public fountains.

The wall of the cathedral was opened by an earthquake in 1634, and some years after shut by a second; but though it is at present not above an inch broad, and filled up with mortar; when Mr. Addison was there, several persons in the town were living who had formerly passed through it. The tower is not without beauty; but having been twice burned, only half of it is now standing. A smaller tower belonging to this church, was also set on fire by lightning, when they prudently beat it down by a chain ball, by which the body of the church was saved, and since that was done, a spire has been raised upon it. This church has two hundred and seventy-two stately pillars, and a fine choir. The choir is separated from the nave of the church by a fine gallery supported by eleven pillars of black marble. To this church are three gates, two great ones and a smaller; one of the largest has a fine portico, adorned with the statues of the twelve apostles, and the Virgin in the middle. The other has also a magnificent portico adorned with small figures in relievo, representing historical passages, besides some statues as big as the life.

Here were formerly eight churches more, together with two convents; but they have been most of them demolished since the Reformation, only *St. Francis's church*,

a handsome large structure, is still preserved for the use of the lower part of the city.

The town-house is a very handsome building, in the finest part of the city, adorned with a portico that has two fine pillars of green marble.

On the east side of the cathedral is a spacious walled terrace, like that at Bern, with this difference, that the terrace of Bern is much higher walled, and that of Lausanne has the advantage in prospect, it commanding the lake, and all the low country towards Geneva. This country, indeed, from its nature and improvements, affords a delightful view in the variety of little hills and dales, fields, meadows, vineyards, and woods, together with the neighbourhood of the lake.

The city is governed by a great and lesser council, the former of which consists of sixteen members, who have the burgomaster for their president; next to him is the treasurer, with the five bannerets, belonging to so many divisions of the city. From these councils, in causes not exceeding twelve hundred florins, appeals lie to a superior council composed of sixty members: but contests relating to larger sums, are carried before the council of Bern. It is remarkable, that there is one street in this city, in which the people have the privilege of acquitting or condemning any one of their own body in affairs of life and death; and as every inhabitant of this street has a vote, houses sell better here than in any other part of the town.

This city was formerly a bishop's see, originally founded at Avenche; but Lausanne closing with the Reformation, and coming under the sovereignty of Bern, the bishop withdrew to Freyburg. A part of the episcopal revenues was applied to the academical gymnasium erected here in 1557, and the bailiff of Bern resides in the bishop's palace, where he judges in all disputes brought before him from the country courts.

S E C T. VI.

The Canton of LUCERN.

Its Situation, Extent, Rivers, and Government, with a Description of the City of Lucern.

THE canton of Lucern, which is the most considerable next to Zurich and Bern, is bounded on the east by the cantons of Underwald, Schwitz, and Zug, and on all other sides by the canton of Bern; extending thirty miles in length, and twenty in breadth.

This canton produces a sufficient quantity of corn for Uri, Schwitz, and Underwald; and as the pasturage is also excellent, the inhabitants likewise apply themselves to grazing.

The principal rivers are the Rufs, which issues from the lake of Lucern, and receives the Emmat, and several other streams. The Wigger has its source in this canton, and also the Suran.

There are only four towns in this country, and the whole canton is entirely Popish, under the see of Constance. It has on all occasions been the principal abettor of Popery in Swisserland; and in 1747, and the following years, it resumed the antient severities against the Protestants; and some of these heretics, as they were called, were put to death with many aggravations of insult and cruelty.

This canton acceded to the Helvetic alliance in 1332, on which the third place was allotted to it; but it is reckoned the first and most powerful of the Popish cantons. Accordingly, whenever they assemble on religious concerns, provided such assembly be not held in one of their capital towns, the envoy of Lucern always presides. The summons are likewise issued from this city, and the recorder is always a member of the council of Lucern.

The city arms are, argent and azure party per pale, and its government is aristocratical.

The city of Lucern, in Latin Lucerna and Luceria, is situated on the banks of the Rufs, which divides it into two unequal parts, that have a communication with each other by three covered bridges. It is encompassed with a single wall, and is rich and populous, it being a well built and polite place. The inhabitants have a great

trade with the merchants of Germany and Italy. The most remarkable things to be seen here, are the organ of the great church, which is very fine, and of an extraordinary size, and the skeleton of a giant in the town-house. The religious buildings are the cathedral of St. Leodigarius and Maurice, the Jesuits college, which contains a church, and four monasteries.

The depositaries of the supreme power are the lesser and greater council: the former is composed of thirty-six members, divided into two equal parts, that relieve each other every half year: the members are chosen by the lesser council alone. The greater council consists of sixty-four persons elected from among the burghers. It is likewise vested with the penal jurisdiction, judges in the last resort, and confers the freedom of the city. At Lucern usually resides a nuncio from the pope, under the title of *legatus a latere*.

The lands and towns subject to this city are divided into fifteen prefectures.

S E C T. VII.

The Canton of U R I.

Its Situation, Extent, and Face of the Country; with a remarkable Road; and a concise Account of the Produce of the Country, and of its Capital.

THE canton of Uri borders towards the west on the cantons of Bern and Underwald; to the north on the canton of Schwitz; and to the eastward joins on the canton of Glaris, the Grisons, and the seven Italian districts, with the dutchy of Milan and the Valais; extending about thirty miles in length, and twelve in breadth.

It almost every where consists of dreadful mountains and deep vallies, the summits of which are perpetually covered with ice and snow. The loftiest among them, and indeed the highest in all Swisserland, is that of St. Gothard, over which is carried a fine road in one continued ascent of eight hours to the very summit of this stupendous mountain. This road deserves particular notice, it being in most parts six feet wide, and every where well paved during its whole ascent. The Rufs runs by its side, sometimes to the right, and at others to the left, over which are several handsome bridges, most of which are of stone. This road in summer is perfectly safe, not only for horses but even for carriages, though in winter the fall of masses of snow have proved fatal to many travellers. It lies between very high mountains, the lower parts of which are covered with thick woods, but above are quite bare. Several parts likewise exhibit the most beautiful cataracts, either from the Rufs, or other smaller streams; while many of them, by reason of the rocks that obstruct their passage, are resolved into a mist, which, by the refracting rays of the sun, form a variety of rainbows, and at the same time both charm and cool the traveller. But as he advances he is terrified at the view of frightful rocks hanging over the road, and so worn out underneath, as if they were just going to fall and crush him to atoms. On the other hand, when he finds himself shut in on all sides by such prodigious high mountains of vastly different aspects, some quite bare, and others tufted with trees, and abounding with a hundred sorts of medicinal herbs, he has reason to admire the wonderful works of the Creator, and to extol the industry and ingenuity of the inhabitants, who at immense hazard, toil, and expence, keep these roads open. For this purpose they join rocks together by arched bridges, cut a way through several rocks; and when the road seems ready to sink, support it by stout walls and buttresses, with great posts, which they drive deep into the earth, and stones, which they fasten to one another by iron hooks.

At about two hours distance above the village of Gestineu lies the largest bridge over the Rufs; it is of stone, and is of a surprising height, with only one arch, which is an exact semi-circle, the piers of which rest upon two rocks also of a prodigious height; and here the noise of the rapid torrent adds to the terrors of the scene. It is fifty feet over, and its height above the water about seventy. It can scarcely be imagined how it was possible

fible to erect a bridge there; and the inhabitants thinking it beyond the power of man to accomplish, suppose it to be performed by the devil, and therefore call it Teuffelsbruck, or the Devil's-bridge.

Immediately beyond this bridge is a road hewn out of the solid rock, for the space of near three hundred paces, and of a breadth sufficient for two horses to pass conveniently a-breast. At the end of this road the country assumes a very different aspect; for as the way below the bridge is bounded by two ridges of mountains, in this the traveller finds himself in a vale, in which is a village called Hospital, that extends through a valley, if that name may be given to the summit of a mountain eight thousand feet high, that has other mountains standing on it rising three thousand feet more, and some even higher. In this valley the road again ascends towards the south, it being paved and of a great breadth, and on each side defended by the highest mountains in Europe. In this part the road is perfectly delightful, the bare mountains, with their cataracts, having a majestic appearance; and the pastures, which are cloathed with a rich verdure, are covered with great numbers of fine horses. About half an hour farther on among the mountains lies the lake of Lozendro, out of which issues the Rufs, which is at first no more than a narrow brook; but it soon receives the greater part of its waters from an adjacent mountain of ice. On the upper part of this vale are several smaller lakes, which may be termed the sources of the river Tessino, which runs beneath them on the side of Italy. Here is also a Capuchin convent, in which two fathers constantly attend, and for a small consideration travellers are very conveniently accommodated; but the poor are obliged to put up with the fare of an adjoining almshouse.

On the Alps, in this canton, during the summer, are fattened many thousand heads of cattle; but the best pastures are on a hill called the Oberalp, the cheese of which is famed for its goodness. There is here a small lake about a hundred paces in length, which abounds in fish, and receives most of its waters from the Crispalt, a high mountain in the neighbourhood. Out of it issues two rivulets, one of which running eastward falls into the Rufs, and the other directing its course eastward into the country of the Grisons, there forms the Upper Rhine.

The vales between the high mountains are, in summer, very hot and fertile, when not exposed to the north winds. Among the mountains are also found numbers of beautiful crystals.

The inhabitants being inured to a rough and hard way of living, are vigorous, brave, and strenuous assertors of that liberty which was so deeply purchased by their heroic ancestors. They were once a free people, under the jurisdiction of the emperor; but Albert I. aiming at their entire subjection, placed a severe governor over them, who, by his tyranny, gave rise, as hath been already mentioned, to an union between Uri, Schwitz, and Underwald. They threw off the Austrian yoke in the beginning of the year 1308, and in 1315 these three cantons entered into a perpetual alliance. At that time Uri held the first place among the confederates; but at present it has only the fourth.

The arms of Uri are or, a bull's head gardent fable, having a ring gules passing through its nostrils.

The government of this canton is democratical, and divided into ten districts, the principal place in which is the following:

Altorf, or Altdorf, that is, the Old Village, in Latin Altorfium, the capital of the canton of Uri, is situated in a plain on the lake of Lucern, near the mouth of the river Rufs, at the foot of the Alps, about twenty-three miles to the south-east of Lucern. The houses are neat, and the streets broad, spacious, and well paved, while the gardens and country houses round it are delightful. It is the seat of the government, and of the courts of justice, who hold their meetings in the town-house. The provincial armoury is also kept here; besides which it has a large new granary, erected in 1733. It has three churches, the principal of which is that of St. Martin; and most of the gentry reside here. In the year 1400 the greatest part of the town was destroyed by fire, and in 1693 it again suffered by the same calamity.

S E C T. VIII.

The Canton of SCHWEITZ, or SCHWITZ.

Its Situation, Extent, Lakes, and Rivers; with a concise Description of its Capital, and of the Abbey or Hermitage of Einsidlen.

THE canton of Schweitz, Schwitz, or Switz, in Latin Sultienfis Pagus, though only the fifth in rank, has the honour of giving name to the whole country, either because the wars of the Swifs for the recovery of their liberty began here, or because here was formed the first confederacy, in defence of their natural and antient rights and privileges. This canton is bounded on the north by the cantons of Zurich and Zug; on the east by Glaris; on the south by Uri; and on the west by Lucern, Zug, and Zurich; extending from north to south about twenty-eight miles, and from east to west twenty-three.

It greatly resembles the canton of Uri, but the parts about the lakes are more fertile. The lakes here are those of Zurich, Zug, and Waldstadten. The Sill has its source in this canton, and, after receiving the united streams of the Biber and the Alps, enters the territories of Zurich.

The canton of Schwitz consists entirely of boroughs, villages, and scattered houses, without so much as one town. The whole country is also popish, and in church-affairs subject to the bishop of Constance. The inhabitants are likewise hardy, vigorous, brave, and extremely tenacious of their liberties.

Its arms are gules, a cross argent, placed on a canton, and its government is democratical.

The canton is divided into six parts, improperly called quarters, to each of which belong certain families or clans, who are not to remove their constant dwelling into any other quarter. The most remarkable places here are,

Schwitz, or Schweitz, the capital of the canton, situated in a pleasant valley, between mountains generally covered with snow, in the eighth degree forty-three minutes east longitude, and the forty-sixth degree fifty-seven minutes north latitude. It is the seat of the ordinary regency, consisting of sixty counsellors, as also the residence of several families of distinction; but it has only one parish church and three convents; with a mint, an hospital, and an arsenal. It was destroyed by fire in 1642, but rebuilt with great advantage; and is the residence of several families of distinction.

The abbey of Einsidlen, which is seated on the Sill, is on all sides surrounded by lofty mountains, on which antiently stood a thick gloomy forest. About the year 906, St. Benno repairing hither, laid the foundation of the abbey and convent, which is of the Benedictine order, and under the direction of an abbot, who is styled prince of the holy Roman empire. In 1704 the convent was rebuilt, and is now a large splendid edifice; the hall of which is finely painted. It has also a well chosen library, with a magnificent apartment and other convenient rooms for the many recluses here, and the entertainment of strangers. The minster church of Our Lady is embellished with very masterly paintings, costly gildings, and very beautiful stucco work; but the most remarkable place in it is a chapel, styled the Holy, in which is an image of the blessed Virgin, which attracts a great resort of pilgrims, who have brought great wealth to the church; and among other offerings is an ostensorium, near two ells high, in which, says our author, are three hundred and twenty pounds and a half of gold, with eleven hundred and seventy-four large pearls, three hundred and three diamonds, thirty-eight sapphires, a hundred and fifty-four emeralds, eight hundred and fifty-seven rubies, forty-four garnets, twenty-six hyacinths, and nineteen amethysts. Near the abbey is Einsidlen, a market-town.

There is a very level fruitful part of this canton along the lake of Zurich, which is called the March, that is the Frontier, it being antiently the boundary between

the Helvetians and Rhetians, or Grisons, from whom it was only separated by the river Limmat. It antiently belonged to the house of Austria; but in 1408 was taken by the troops of Appenzel, who made a present of it to this canton, as an acknowledgment for their assistance. In this district is contained,

Lachen, its capital, and the place where the court and council hold their meetings, seated on the south side of the lake of Zurich, and is the port where travellers land who go by water from Zurich to the cantons in the mountains.

Altendorf, a village about a musket-shot from the former, where, in 1704, a large fragment from the mountain, at the foot of which it stands, suddenly fell on a part of this village, and the neighbouring meadows, destroying a number of people and cattle, as well as houses.

SECT. IX.

The Canton of UNDERWALD.

Its Situation, Extent, Produce, Government, and principal Town.

UNDERWALD, or Unterwalden, in Latin Subsilvania, is bounded on the north by the canton of Lucern, and by the lake of the four cantons; on the east by high mountains, which separate it from the canton of Uri; on the south by the same canton, and that of Bern; and on the west by that of Lucern; extending about twenty-five miles in length, and seventeen in breadth.

It takes its name from a large forest of oaks nearly in the middle of the country, that traverses it from north to south, and is divided into two parts, that above the forest and that below it. The canton is small, but abounds in fruit and cattle. The mountains are covered with rich pastures, and fields and the vales are remarkably fertile: for in spring, when the snow is off the ground, they are full of cattle, which being afterwards driven up the Alps, the herbage shoots again in such a manner, as to be mowed twice in a summer; and in autumn the cattle, on their return from the Alps, meet again with plenty of grass, till the snow sets in again. All the lower parts of the country produce an exuberance of very fine fruit, and the canton is so well provided with wood, that, without any detriment, several spots might be cleared and improved into meadow or arable land. It has little or no wheat, and no wines are made here. In this canton are also good quarries of marble, and three sulphureous springs. Here rises the river Aa, and in this canton are the small lakes of Lungern, Ruden, and Sarner.

There are in this canton only small market-towns, villages, and scattered houses. The inhabitants in their apparel and manner of life adhere to the old fashions. They are universally popish, and form a part of the diocese of Constance.

The arms of this canton are argent, party per fesse, with a double warded key erect, in pale gules and argent.

The government is purely democratical, the regency being the depositary of the whole supreme power, in which all males above sixteen years of age have a right of admittance. As the country, however, consists of two vales, each forming a separate republic, so they have each their particular council and officers. To the general assembly of the Helvetic confederacy each vale sends a representative; but both act as for the same canton, the two representatives enjoying only one single voice.

The principal town in this canton is Stanz, or Stans, which is seated on the south side of the lake of Lucern, and has a handsome church, adorned with statues of black marble from quarries near the town. It has also a convent of Capuchins, and a nunnery. On the graves of this place are crosses of wood and iron, and on some of them hang little copper kettles of holy water, which the women sprinkle on the graves with little bunches of herbs.

SECT. X.

Of the Canton of ZUG.

Its Situation, Extent, Produce, and Government; with a concise Description of the City of Zug.

ZUG is a very small canton, bordering towards the north on that of Zurich; to the eastward on the same canton, and that of Schwitz; to the southward also on the latter, and that of Lucern; and to the westward on the Free Provinces, and a part of the canton of Lucern: but is not above twelve miles either way.

The pastures here are excellent, and it also produces a sufficiency of grain, with plenty of fruit, and some wine. On one side of the lake of Zug the country is covered with chestnut trees, which form a very profitable branch of trade by the sale of the nuts into the neighbouring countries. The woods have plenty of game; and in general it is a fine rich canton. The above lake yields carp, that weigh from fifty to ninety pounds weight, with pike of fifty pounds, and plenty of trout and other fish. Out of this lake runs the river Loretz, which joins the Rufs.

The only city in this canton is Zug, all the other places here being only small towns and villages. The whole country is popish, and under the jurisdiction of the diocese of Constance. This canton is the seventh in rank, and among the lesser ones the fifth; besides which it is in a particular manner connected with Lucern, Uri, Schwitz, and Underwald, commonly called the five territorial confederates.

Its arms are azure, a fesse argent.

The government of this canton is entirely democratical, the supreme council being lodged in a council which annually meets in the town of Zug, and in which every male of sixteen years of age is possessed of a vote. It is composed of deputies from the five divisions of the canton. The chief person here is named the amman, who is alternately elected from the town and the territory; but the town amman continues in office three years, while that of the country enjoys his office only two. This officer must always reside in the town. Next to him is the stadtholder, who keeps the provincial seal. The daily dispatch of incidental occurrences, and the ordinary public affairs are committed to the stadtholder and amstrath, which consists of forty members, that is, thirteen from the town, and twenty-seven from the country. The penal jurisdiction is lodged in the amman, assisted by certain assessors from the town and country. Besides the town, every quarter in the canton has a distinct council and recorder of its own for the management of its affairs. For the administration of justice, the city has two courts, named the greater and less, one half of the members of which are appointed by the city, and the other half by the two quarters of Aegeri and Bar.

The principal place in this canton is the city of Zug, in Latin Tugium; it is situated on the east side of the lake of the same name, which is about seven miles long, and at the foot of an agreeable hill, which gradually rises to a great height, in the forty-seventh degree seven minutes north latitude, and in the eighth degree thirty-four minutes east longitude, sixteen miles to the east of Lucern. It has spacious streets, and the houses are well built. It has a collegiate church, a parish church, a convent of Capuchins, and a nunnery. In 1435, the town suffered by a melancholy accident; when a street by the side of the lake was swallowed up by it, with a whole row of houses, and the town-wall on that side, and yet it is said, that no more than fifty persons were drowned.

SECT. XI.

The Canton of GLARIS.

Its Situation, Extent, the Face of the Country, and its Produce: its Rivers and Lakes; the Religion and Government of

of the Country; with a Description of the City of Glaris its Capital.

THE canton of Glaris, or Glarus, is bounded on the east by the county of Sargans, and the country of the Grisons; to the south by the latter, and the canton of Uri; to the west by the latter, and the canton of Schwitz; and to the northward by the March and Galter, extending, according to some authors, near twenty-five miles from north to south, and eighteen from east to west.

On the east, south, and west borders, it is environed with mountains of so great height, that they are continually covered with ice and snow, particularly by the Todiberg, which is esteemed one of the highest in all Switzerland, and is almost impassable, notwithstanding a road has with great labour been made over it from the great vale in Glaris to the country of the Grisons. From the north, where the country is open, a valley extends to the southward for the length of eight hours; but below Schwenden, the mountain named Freyberg, divides into two separate vales, the greater and the less; the former of which lies to the west, and the latter to the east of that hill: besides which, there are several other valleys among the ridges of the mountains.

Though these vales are in many parts extremely proper for agriculture, very little grain is sown in them; the inhabitants being chiefly employed in grazing horses, and sheep on the Alps; and with these cattle they also feed many thousand heads of horned cattle, carry on a profitable trade, and likewise export cheese, butter, and tallow. On these mountains are large woods of pine, with crystal pits. The high mountain named Blattenberg yields vast quantities of slate, which being polished and formed into tables, or put into wooden frames for writing, are exported to all parts. Of all the mountains in Switzerland, that named Freyberg affords the safest refuge for the chamois goats; only twelve sworn hunters being permitted to shoot them, and these at no other time but between St. James's day and Martinmas.

Among the Alps are several mineral waters and baths. The largest river here is the Linth, which issues out of two rivulets in this canton, and traversing the country from south to north, receives the Sernft, which is formed by the conflux of several small streams. The Lontsch issues from the lake of Clonthal, and the Sees is the outlet of the lake of Wallenstadt, which extends from west to east no less than four hours, though it is not one in breadth. Towards the east and west it lies quite open; but its north and south sides are terminated by very high craggy rocks and precipices. The barks and passage boats receive great advantage from the remarkable regularity of the winds in these parts, which early in the morning set in with an easterly breeze, and thus continue till about ten o'clock, when a calm takes place till noon, and then is succeeded by a westerly wind till sun-set; when if the weather be fair, the easterly breeze then returns. This regular succession of the winds is only interrupted by a north blast, and that not often. These phenomena, however, are accounted for from the situation of the lake.

The greatest part of the inhabitants are Calvinists, the rest are Papists, and in many parishes they are intermixed, yet they live peaceably enough, divine service being in many places alternately performed by both in the very same churches; so that on one Sunday the mass begins, after which a curtain being drawn before the altar, the Calvinist service follows; the next Sunday the Calvinists begin, and when they have done, mass is performed. To the Calvinists belong thirteen parishes; but there is only one that can be stiled entirely Popish, though at Glaris and Linthal, they have their ecclesiastics equally with the Calvinists, and are under the bishop of Constance.

The number of males in this canton above sixteen years of age, amount to somewhat more than four thousand. The principal business and trade of the inhabitants is grazing, though they are not without manufactures, as those of cotton, and a kind of cloth called matzen.

The arms of this canton are gules, a pilgrim bearing a staff, sable.

Its government is democratical, the supreme power being lodged in the court called landesgemeine, which is held once a year in a field without the town of Glaris, and to this council the males of both religions, who are upwards of sixteen years of age, have admittance. Besides these, each religion has its particular landesgemeine, which are likewise held annually in the open fields. The principal persons in the whole country are the landamman and the stadtholder, both of whom are alternately elected from among the Calvinists and Papists, with this distinction, that the Calvinist landamman holds his office for three years, and that of the Papists two; but with the stadtholder it is the reverse, the Calvinist stadtholder continuing in office only two years, and the Popish three. The landamman usually summons the general and particular counsellors of his sect: the like is done by the stadtholder, and each presides in the courts he thus summons. The landamman keeps the seal of the canton; but when business calls him out of his territories, delivers it to the stadtholder, who is president during his absence. Next to the chief officers is the banneret, who is alternately elected from among the two religions, and holds his office during life. The court called the landrath is composed of sixty-three members, forty-eight of whom are Calvinists, and fifteen Popish, and, when necessary, is held in the town of Glaris, the landamman sitting as president; and each sect has its particular landrath, for their separate concerns: the landrath of each religion has also the criminal jurisdiction over the votaries of such religion; but if the delinquent be a foreigner, he is tried by both landraths.

Military affairs are managed by the provincial captains, provincial ensigns, masters of artillery, and bannerets. The Calvinists have their own council of war, consisting of seven members.

The only town in this canton is,

Glaris, or Glarus, in Latin and Italian Glarona, situated between the lofty mountain of Glarnich, and the river Linth, in the forty-seventh degree north latitude, and in the ninth degree eight minutes east longitude, and is a large and handsome place. The Protestants and Papists live very peaceably together, and perform divine worship in the same church one after another, in the manner already observed; but the Calvinists are by far the most numerous. The landraths and courts of justice are usually held in the town-house, and just without the town is the place where the annual landesgemeine of the two sects are held. This town has been several times destroyed by fire.

S E C T. XII.

Of the Canton of BASIL.

Its Situation, Extent, Produce, and Rivers; with a particular Description of the City of Basil and its Government.

THE canton of Basil is bounded on the east by the Frickthal; on the south by the territory of Solothurn; on the west by the same country, the diocese of Basil, and the Sundgau; on the north by the lordship of Roteln in the margravate of Baden-Durlach, extending about twenty-four miles from north to south, and twenty-one from east to west.

The country from Basil to Lichstal abounds in corn and wine; but beyond it is extremely mountainous, cold, and barren, except the vallies on these mountains, where are the most beautiful pastures covered with cattle. In the city of Basil are several medicinal springs, and in the rest of the country baths of approved virtue. The Rhine waters the north-east side of the canton, and the other rivers are the Ergets, the Birs, the Birsig, or Birsac, and the Wesen.

In the whole canton are three towns, which have constantly persevered in the profession of the protestant religion, ever since its introduction in 1529. It contains twenty-seven parishes, divided into three deaneries.

The

The arms of the city of Basil are argent, a figure fable, by some supposed to be the ferril of a pilgrim's staff, and by others a fish-hook.

Its government is aristocratical. The provincial militia is divided into two regiments, each consisting of ten companies and a troop of dragoons; to each regiment is a colonel, a lieutenant-colonel, and a major.

The principal places in this canton are the following,

Basil, or Basél, in French Basle and Bâle, and in Latin Basilea, is the capital of the whole canton, and the largest city in all Switzerland. It is seated in a fertile and delightful country, on the banks of the Rhine, on the confines of Alsace and the empire, in the forty-seventh degree thirty-six minutes north latitude, and in the seventh degree thirty-six minutes east longitude.

The Rhine, which divides it into two parts, called the Greater and Less, is here joined by the little rivers Birs and Birsac; the bridge over the Rhine which unites the two towns, is six hundred feet in length. On a tower which stands on the side is a crowned Moor's head, which every minute thrusts out its long red tongue: but this droll figure does not, however, says Mr. Keysser, give such a disgust, as a filthy representation in a little cabin standing on the middle of the bridge, before which the public prostitutes, at their being banished the town, are brought to undergo some ridiculous ceremonies. The city, which lies on the German side of the Rhine, is called the Lesser Town, and has its own jurisdiction; but is subordinate to the Great Town, and has no fortifications. The Great Town has five suburbs, and besides its walls, is fortified with towers, moats, and four bastions; but is not of any great strength. Basil contains two hundred and twenty streets, six market-places, and ninety-nine wells. Its situation is uneven, most of the streets being crooked, and paved with sharp stones, which are designed for the surer footing of the horses that carry loads up hill. In this part lie the three principal churches and parishes, the minster, or antient cathedral, St. Peter's, and that of St. Leonard. To the minster belong four other parishes, the priests of which also assist in that cathedral. The French perform divine service in the church of a Dominican convent.

The Teutonic order have a commandery here, as have also the order of St. John near the church of that name; the house belonging to the order is inhabited by the bailiff, and sometimes by the commander himself. The town-house, which stands on the river Birsac, is supported by very large pillars, and its great hall is finely painted by the celebrated Holbein. Those who are admirers of pictures should not neglect to take a view of these, and particularly of the Dance of Death, on a covered wall near the French church, representing a long train of persons of all sorts, holding one another by the hand, Death leading the dance. Holbein was a native of Basil, and having learned his art without any instructor, had a peculiar turn in all his pieces. The university, which was founded in 1459, has a very curious physic-garden, which contains the choicest exotics, and adjoining to the library is a valuable museum well furnished with natural and artificial curiosities, and particularly with medals and paintings; and in the cabinets of Erasmus and Amerbach, which also belong to the university, there are no less than twenty original pieces of Holbein; for one of which, representing a dead Christ, a thousand ducats have been offered. The Helvetic society apply their attention to the improvement of science, besides which there is a philological society of Germans.

Near the minster, and close by the Rhine, is a spot of ground regularly planted with trees, commanding a most beautiful and extensive prospect. On this spot stands an academy, in which are no less than eight classes. St. Peter's square is planted with elm and lime trees, and there the celebrated doctor Feesch built his noble museum, which is greatly admired by persons of literary curiosity, ordering, that, on the failure of civilians in his family, it should fall to the university. The margrave of Baden-Durlach has a stately palace in the new suburb, which contains a most splendid chamber of curiosities in art, nature, antiquities, and paintings.

In the little town is the parish church of St. Theodore, with a Carthusian convent, that was originally a nun-

nery of Clarists, though it now serves as an orphan-house and a house of correction. In the church of this convent morning prayers are read and sermons preached, as likewise in a building that was once an Augustine nunnery.

The supreme power is lodged in the great council, which is composed of two hundred and sixteen persons, under two burgomasters and two wardens of trades. Out of each of the fifteen companies of the greater city are elected fifteen representatives, and out of each of the three companies of the little city twelve. The lesser council is composed of six members and a president, who are selected from among the great council. Thus the four principal persons, in conjunction with the greater and lesser councils, form together an assembly of two hundred and eighty persons. The other colleges here are the privy-council, in which are discussed all affairs of importance, relating either to war or the police; and the opinion of this council is laid before the lesser, and after that before the greater council: the dreyerherren, which superintend the city revenues and treasury, as also the disbursements of the government: the supreme inspectors of the churches and schools within the town and country, who are composed of three members of the lesser council and the city recorder; besides which each town has a particular court for the determination of civil causes.

All military affairs in the city are under the inspection of two principal commissaries at war, who are always the two burgomasters, an inferior commissary, a town lieutenant, and town major, assisted by the captains of the guards in the great town and the five suburbs, and likewise by those of the lesser town.

A great trade is carried on at Basil in ribbons. The police is under great regulations; most of the offices being bestowed by lot, and none but qualified persons admitted candidates: but a person can seldom hold a lucrative employment above five years. No person is to wear silver or gold lace, under the penalty of three guilders for every offence; and all unmarried women are prohibited wearing silk cloaths. The garb of the counsellors, ministers, and professors, with their stiff ruffs, long beards, and high crowned hats, give them a very solemn and singular appearance.

Here is a remarkable singularity, which is, that the clocks in the city of Basil are always an hour faster than those of the country; the reason for which is variously related. Among others, it is said, that it was in order to bring the fathers of the famous council which sat here earlier together, for the quicker dispatch of business. However, the custom still continues. Salmon comes up to this part of the Rhine to spawn, and bits of gold are sometimes found in this neighbourhood, which shew that there are mines of gold near the river; but it does not appear that they have yet been discovered.

About a quarter of a league without the city is a lazaret house, with a church on the spot where, in 1444, sixteen hundred Swiss bravely fought for ten hours a French army under the command of the Dauphin, consisting of thirty thousand; the former were all killed except sixteen, but not before they had slain six thousand of the enemy.

SECT. XIII.

The Canton of FREYBURG.

Its Situation, Extent, Produce, and Rivers: the Languages spoken there: the Government and military Force of the Country; with a particular Description of the City of Freyburg, and of a remarkable Hermitage.

THE canton of Freyburg, or Friburg, is encompassed on all sides by the canton of Bern, a few places only excepted, which border on the Neuenburg lake, and some districts belonging in common to Bern and Freyburg. Its length from north to south is near forty-seven miles, and its breadth from east to west about twenty-seven.

The north-west parts of the country are less mountainous than the others, and consequently produce plenty of corn and fruit, and even some wine; but though the other parts are mountainous, they have good pastures, on

on which feed large herds of cattle. The inhabitants export great quantities of cheese to France and other countries.

The principal rivers of this canton are the Sanen, the Sanfen, and the Broye, or Bruw; the first of which rises in the canton of Bern, and in the territory of Freyburg receives the second at its issue out of a lake, after which it joins the Aar in the territory of Bern. The third rises in this country, and having successively traversed the territories of Bern and Freyburg enters the Murter lake, from whence it issues again, but at length both its stream and name are lost in the lake of Neuenburg.

In this canton are seven towns, the inhabitants of which speak a kind of Patois, or a corrupt medley of German and French; but in the town of Freyburg the pure German prevails among persons of rank, that language being used in the council in all public instruments, and in the two churches; it is also commonly spoke in a small part of the town that lies towards Bern. The German likewise prevails in several parts of the canton, but the Patois is used in the greatest part.

Both the town and the country are entirely Popish, and under the jurisdiction of the bishop of Lausanne, who resides at Freyburg. The whole canton includes under it a hundred and four parishes, which are ranged under their respective deaneries. In 1481 this canton was received into the perpetual union of the Helvetic body, at which time it formed the ninth in rank; but on the accession of Basil it voluntarily degraded itself to the tenth.

The arms of the town are party per fesse, sable and argent.

The military affairs are under the direction of a commander in chief, assisted by seven other persons. The burghers of the town of Freyburg are divided into four companies; but the country militia constitute eleven regiments.

The most remarkable places in this canton are the following:

Freyburg, or Fribourg, seated on the river Sane in a deep valley among high rocks, and so irregularly that the inhabitants are forced to climb up several parts of it to a prodigious height; but this inconvenience is counterbalanced by a singular advantage; for having several reservoirs on the tops of the mountains, if a fire breaks out in any part of the town, they, by opening a sluice, convey a river to the very spot where it is immediately wanted. The town is on all sides environed with a wall and towers, though on the north, south, and eastern sides the rocks might have supplied the place of those works. The four parts into which it is divided are named the Burg, the Aue, the New Town or square, and the Spital or Square. In the first is the collegiate church of St. Nicholas, in which the service is performed in German; the states-office; the council-house, which stands on a high rock, and commands a grand prospect, particularly of the delightful course of the Sone; a nunnery; and a Capuchin convent, which contains a seminary for philosophy and divinity. Mr. Addison, speaking of this convent, says, that he here saw the Escargatoire, which is a square place boarded in and filled with a vast quantity of large snails, which, when well dressed, are esteemed excellent food. The floor is strewn about half a foot deep with several kinds of plants, among which the snails nestle all the winter. At Lent they open their magazines and, take out of them the best meagre food in the world; for there is no dish of fish which they esteem comparable to a ragout of snails.

In the second division is the church of St. John the Minor, together with the convent of Augustine Eremites, in the church of which the service is performed in German. Here is also the hospital of St. James, which likewise contains a church.

In the third division is the church of St. John the Elder, with a commandery-house of that order adjoining to it, a Franciscan nunnery, and a very large granary.

In the fourth division is the parochial church of Notre Dame, with a convent of bare-footed friars which serves as a kind of academy for philosophy, the mathematics, and divinity: in this convent the service is performed in French. There are also the fine college of Jesuits, said to be the most beautiful in Switzerland; but it stands

so high, that the ascent to it consists of some hundred steps, and here the French language is also used in the church; an Ursuline nunnery; the great hospital, which contains a church; the arsenal; the defensional office; the salt-office, and the mint; the manufacture-house, and other public edifices.

The government is aristocratical, the patritii, or certain privileged families, to the number of seventy-one, being alone qualified to sit in the lesser or greater council; but before even these can have a share in the government, they must be free of one of the thirteen companies of the city. The supreme power is lodged in the lesser and greater council of two hundred members, that is, in twenty-four lesser counsellors, and a hundred and twelve burghers. The head person in the state is named the prætor, or avoyer; and of these there are two, who act annually by turns. The senior in the lesser council is always stadtholder, and at the same time colonel of the canton, and takes place next to the prætor. Every three years a burgomaster is chosen from among the lesser council, in order to attend to the behaviour of the burghers, and he has the power of punishing some crimes by his own personal authority. The general and upper *commissarii*, of whom one or two may be elected from among the lesser or greater council, superintend the fiefs, jurisdictions, lordships, and other possessions of the state. The privy-council is composed of the four bannerets, and six members from each of the four divisions of the town. This court generally sits four times a year, and, besides electing the members of the great council, is empowered to lay before the government such schemes as are thought of advantage to the public. The town court is vested with the civil jurisdiction of the city, and by order of the lesser council, to which alone the power of life and death belongs, hears also criminal cases. The country court decides all contests and processes among the inhabitants of the antient territory. The court of appeals receives appeals from most of the provinces, and its decrees are decisive, except the party cast can make it appear to the bannerets and the recorder that his honour, fortune, and life, depend on the issue; upon which he is allowed to appeal to the greater or lesser council.

About two leagues from Freyburg is an hermitage, that is esteemed the greatest curiosity in these parts. It is situated in the most agreeable solitude imaginable, among woods and rocks, which at first sight dispose a man to be serious. In this place an hermit had lived twenty-five years, who with his own hand had formed in the rock a pretty chapel, a sacristy, a chamber, parlour, refectory, kitchen, cellar, and other conveniences. Notwithstanding the rooms lie very deep, his chimney is carried up through the whole rock, to the height of ninety feet. He had also cut the side of the rock into a flat for a garden, and by laying upon it waste earth, which he found in several of the neighbouring parts, made such a spot of it as furnished out a kind of luxury for an hermit. In short, seeing drops of water distilling from several parts of the rock, he by following the veins made two or three fountains in the bowels of the mountain that at once served his table, and watered his little garden.

The chapel is sixty-three feet long, thirty-six broad, and twenty-two in height. The sacristy, or vestry, is twenty-two feet both ways, and fourteen in height. The steeple is seventy feet high to the top of the rock, and six in breadth. The saloon, or anti-chamber, between the chapel and the refectory, is forty-four feet by thirty-four. The refectory, in which are his bed and stove, are twenty-one feet long. The hall, or parlour, is thought to be the most surprising performance, it being twenty-eight paces in length, twelve in breadth, and twenty feet high, with four openings representing large windows. At one end of it was his cabinet, with his little library. The cellar is ten feet deep, and twenty-five long.

This hermit, whose name was John de Pre, began to hollow the rock at thirty years of age, and said he was twenty-five years in compleating it, having had no sort of assistance in this work from any person but his valet. The river Sane flows by the foot of the rock, and round this wonderful hermitage is an easy descent covered by

part of a delightful forest, in which are shady woods and avenues.

It is impossible to view this structure without a mixture of concern for the fate of its first owner, a man of such contrivance and industry, who carrying back some young people that came to visit him on the consecrating of his chapel in the year 1708, was drowned in the river Sane, on which he used once a week to fetch necessaries from the town in a little boat.

SECT. XIV.

The Canton of SOLOTHURN.

Its Situation, Extent, Produce, and Rivers. The Religion of the Inhabitants, and a Description of the City of Solothurn.

THE canton of Solothurn is bounded on the east and south by the canton of Bern, on the west by the territory of Basil and the diocese of that name, and on the north by the canton of Basil, extending on both sides the river Aar about twelve miles from north to south, and ten where broadest from east to west.

It consists partly of Mount Jura, and partly of a level country. Its soil is tolerably fertile, particularly in the level parts, which yield grain and fruit, and in some of the districts of this canton are fine woods, pastures, and vineyards. The rivers of this canton are the Aar, or Aren, which is joined by the greater Emmat.

In the whole canton are two towns and four villages. The established religion is Popery, except in one of the districts, which is named Bucheckberg, where the inhabitants are Calvinists, and the ministers are nominated by the city of Bern. The Popish churches here are distributed among the dioceses of Constance, Basil, and Lausanne.

Solothurn can raise ten thousand men. It was received into the Helvetic body in the year 1481, and is in rank the eleventh canton.

Its arms are party per fesse gules and argent, and its government aristocratical.

Solothurn, in Latin Soludurum, and in French Soleurre, the capital of the canton, is situated in the forty-seventh degree seventeen minutes north latitude, and in the seventh degree thirty-five minutes east longitude, in a fertile and pleasant country on the river Aar, by which it is divided into unequal parts, and the city is surrounded on both sides that river with new fortifications of free-stone at a vast expence. Its best fortifications are, however, the high mountains that lie within its neighbourhood. It contains a collegiate church, with an abbey dedicated to St. Ursina, a very fine Jesuits college, a convent of barefooted monks, and an arsenal. The Jesuits church is the finest modern building in Switzerland, and is famous for its paintings, stucco-work, and frontispiece, to which Lewis XIV. gave ten thousand livres. At a small distance from it stood the old cathedral, on the ascent to which are two antique pillars, which, by their proportion, seem to be of the Tuscan order, and belonged to an old heathen temple dedicated to Hermes. The streets are large and adorned with fountains, and the neighbouring country is planted with very fine walks.

This city is the usual residence of the French envoy to the cantons, and its burghers are ranged into eleven companies, out of which both the greater and lesser councils are elected and filled up; and, in short, their government is much like that of Freyburg.

The lands belonging to this city are divided into eleven districts, in which are a considerable number of populous villages.

SECT. XV.

The Canton of SCHAFFHAUSEN.

Its Situation, Extent, and Produce. A Description of the City of Schaffhausen, with its Government; and of a remarkable Cataract.

SCHAFFHAUSEN is the most northern of all the cantons of Switzerland, and is for the most part sur-

rounded by Swabia, the canton of Zurich, and the Black-forest; extending about twenty miles from east to west, and twelve from north to south.

This country produces a good deal of corn, though not sufficient for the inhabitants, who are supplied with what they want from Swabia. It abounds in pasture, hay, and fruit, and exports a great deal of red wine. Instead of lofty mountains it has fertile eminences. The Rhine is the only river of any note in this canton.

In the whole country there are but two towns. The inhabitants are of the Calvinist religion, and the parishes, beside those of Schaffhausen, are nineteen in number. In 1501 this canton was received into the perpetual alliance, and thus became the twelfth canton.

The arms of Schaffhausen are argent, a ram salient and fable, with a crown or.

The town of Schaffhausen, in Latin Scaphusium and Probatopolis, is seated on the Rhine, over which it has a handsome stone bridge, in the forty-seventh degree forty-seven minutes north latitude, and in the eighth degree forty-six minutes east longitude. The churches here are those of St. John, which has the reputation of being the largest in all Switzerland; All Saints church, called the minister, once belonged to a Benedictine abbey, and having been enlarged and beautified at the city's expence, is esteemed a fine structure; and on the largest bell, which is said to weigh ten tons, and to be thirty feet round, is this inscription:

Vivos voco, mortuos plango, fulgura frango.

That is,

“ I summon the living, bewail the dead, and break
“ lightning.”

For in the ages of superstition it was imagined, that bells derived a power of dispersing tempests, supposed to be raised by evil spirits, from the baptizing of them, which was performed with a deal of shew and ceremony. There are likewise two other churches. Besides these buildings it has a *schola illustris*. It was antiently called Schifhausen, or Barge-house, as here the boats coming down the Rhine from the lake of Constance were obliged to land their goods, on account of the cataracts at Lauffen, at which place they were put on board other vessels; but its name was changed to Schaffhausen, which signifies sheepfold, it having probably carried on a considerable trade in sheep.

Most of the houses are painted on the outside, and are as commodious as handsome; the streets are spacious and clean, adorned with several fountains, that have generally pillars in their basons, and statues of William Tell, the famous archer, or some other deliverers of their country.

At the upper end of the town stands a large tower, with a good number of guns mounted; but which serve more for ornament than defence. On the highest ground of all is a citadel, which commands the town, with thick walls, two wells, an arsenal, and lodgments under ground bomb-proof, capacious enough to contain two thousand men. The town itself is well fortified with walls and towers even next the Rhine. Without the walls are three suburbs, in one of which is a plentiful spring, and near it is a large deep quarry.

The burghers of Schaffhausen are computed at two thousand; the arsenal is far from being considerable, yet, on any emergency, sufficient to arm the townsmen, and other subjects, who, otherwise, are not without necessary arms, every common inhabitant, or peasant, going to church with his sword by his side: and whoever appears before the magistrate without that weapon and his cloak, incurs a severe penalty. Over great part of the district of Mount Jura, particularly in the canton of Bern, the men go to church not only with their swords, but bayonets and firelocks, which, during the service, they either keep by them, or hang up in a particular corner of the church; an usage, not improbably, derived from the frequent commotions of former times, and the wars with the Burgundians, against whom, as an adjacent and dangerous enemy, it behoved them to be continually upon their guard.

The

The supreme power in Schaffhausen is lodged in the lesser and greater councils, the former of which is composed of twenty-four, and the latter of sixty members, an equal number of whom are chosen out of the twelve companies of the town, the first of which consists of six noble families. The principal persons in the state are two burgomasters, who enter upon their office alternately every year, and next to these is the stadtholder. The privy-council consists of seven persons, and the town-court of twenty-five. The matrimonial-court is composed of the stadtholder, five counsellors, and three ministers.

The principal trade of this city consists in unlading of vessels, and the exporting of linen, copper, and other metals, by means of the Rhine.

The city entered into a league with Zurich and St. Gall in 1424, and with Zurich, Bern, Lucern, Schweitz, &c. in 1501, and in 1529 embraced the doctrines of the Reformation.

About a quarter of a league from Schaffhausen is a tremendous cataract on the Rhine, where that river precipitates from a rock said to be seventy feet high, and ninety paces in breadth. Even before the Rhine reaches this cataract, the ground is very rocky; and at the fall divides itself into three streams, of which the green beds and silver vortices make an agreeable contrast to the beholder; but at the same time his mind cannot help being filled with a mixture of dread and amazement at the roar of the waters: on the south, or the Zurich side, is the most impetuous breach, the violence of the fall altering the water, as it were, to a white dust, part of which, like a light cloud or mist, hovers in the air, and with the intercepted sun-beams forms a variety of most brilliant rainbows.

S E C T. XVI.

The Canton of APPENZEL.

Its Situation, Extent, Produce, and Rivers: the Religion of the Inhabitants, their Manufactures, and military Strength; with a concise Account of the Town of Appenzel.

APPENZEL is bounded on the east by the Rheinthal, on the southward by the canton of Zurich and that of Schweitz, to the westward by Tockenbourg, and to the northward by the territory of the town and abbey of St. Gall, extending thirty miles in length, and about twenty-four in breadth.

The country along the Rheinthal is very fruitful, but that bordering on the high chain of hills to the southward is rugged and mountainous; yet its natural sterility has been overcome by the persevering industry of the laborious inhabitants, in such a manner, that scarce any barren spots are to be seen; at least they afford good pasture; but their agriculture is both chargeable and toilsome. The country produces wheat, rye, barley, oats, peas, beans, and flax in abundance and of extraordinary goodness, though they are too frequently injured by the frost in the spring. This canton also produces a sufficient quantity of wine to supply the whole country; but the white wine made here is tart, though the red is good; and there are such plenty of fruit, that vast quantities of cyder and perry are made here. Wood abounds every where, so that the inhabitants are enabled to supply the adjacent countries.

This canton abounds in mineral waters, and the rivers and brooks in most parts contain plenty of fish, particularly of fine trouts. The principal river is the Sitter, which issues out of the Alpersee, the largest lake in the whole country, and being increased by the rivulets called the White-water, the Weishach, and the Urnach, enters the territories of the abbot of St. Gall. The Aach, another river that rises in this country, after traversing the territories of the abbot of St. Gall, where it is called the Goldach, discharges itself into the lake of Constance.

There is only one town in the whole canton, and only eight villages; the other dwellings of the inhabitants being scattered about. There are, however, twenty

parishes, of which four, with two chapels of ease, are Popish, and nineteen Calvinist. From the year 1522, in which the Protestant religion was first introduced till 1588, very great animosity subsisted between the country people on account of religion, till, by the mediation of the other twelve cantons, peace was restored. Those of the Romish church are in spiritual matters under the jurisdiction of the bishop of Constance.

The Protestants annually weave many thousand pieces of linen, which are either vended at home, or at Trogen, St. Gall, and other places, and from thence exported into France, Italy, Spain, and Germany. The thread spun by the women at Appenzel, and those beyond the Sitter is so fine, as to sell for upwards of sixteen guilders the pound. Great quantities of thread are also bought up in the Rheinthal, Tockenbourg, the Thurgau, and Swabia, and manufactured here. The other considerable exports of this canton are cheese, cattle both fat and lean, horses, wood, and charcoal.

The arms of this canton are argent, a bear erect sable, with paws gules.

The common defence of the country is not only provided for by means of a war-office; but every man is to furnish himself with a musket, powder, and ball. Both the young and old are exercised at certain periods, and their arms inspected from house to house. In each parish are five draughts of their young men ranged under commission and non-commission officers, who are always ready to march on the first notice. This canton is able to bring a considerable force into the field, and next to Bern, Zurich, Lucern, and Freyburg, is the most powerful of the whole confederacy. The Calvinists are three times the number of the Papists, the soldiery of the latter not exceeding three thousand; whereas those of the former amount to ten thousand.

The principal place in this canton is Appenzel, in Latin called Abbatis Cella, which name it obtained from an abbot's cell, built here in the eighth century. It is situated in a delightful valley, on the bank of the river Sitter, in the forty-seventh degree thirty-six minutes north latitude, and in the ninth degree one minute east longitude, thirty-one miles to the east of Zurich. It has one parish church, with a convent of Capuchins, a nunnery of Clarists, an armoury, and a town-house: here also the antient general record-office of the whole canton is kept, and the courts of justice are held.

We have now laid before the reader as distinct a view as we were able of the thirteen cantons, and shall proceed to those bailiwicks, or governments, which, though not within any of the above cantons, are jointly possessed by two or more of them; and shall then proceed to describe the associated countries.

S E C T. XVII.

Of the Places subject to the Thirteen Cantons, and first of Thurgau: its Situation, Extent, Produce, and Rivers; the Manner in which it was obtained by the Swiss; with its Government, and a Description of the Cities of Frauenfeld and Arbon.

THE bailiwick of Thurgau, or Thurgaw, is bounded on the east by the lake of Constance; on the south by the countries belonging to the prince and abbot of St. Gall; on the west by the cantons of Zurich and Schaffhausen; and on the north by Swabia and the Lower lake, which by some is held to be a part of the lake of Constance.

Though this country is somewhat mountainous towards the south, yet it there affords rich pastures, and its other parts, which approach nearer to plains, produce plenty of grain, with vegetables and fruit of all kinds, as also wine. The supreme jurisdiction over that half of the lake of Constance which borders on this country, belongs to those cantons that are sovereigns of the Thurgau.

Its principal river is the Thur, which gives name to the country, and flows out of the territory of the abbot of St. Gall, after which it receives the Sitter, and being

ing at length joined by the Murk, passes on to the canton of Zurich.

The country is populous and well cultivated, containing six towns, a great number of seats, and upwards of one hundred and seventy villages. About one third of the inhabitants are Papists, and in church affairs subject to the bishop of Constance. The other two-thirds, who, ever since the year 1542, have been Calvinists, are divided into forty-nine parishes, which are ranged under three deaneries.

The Thurgau is a very antient bailiwick, which in 1460 was in the possession of the house of Austria; but in that year the Swiss being at war with arch-duke Sigismund, wrested this country from him, and by the peace concluded the following year at Constance, it was confirmed to them. The cantons to which the sovereignty of this country belong are, the eight old cantons of Zurich, Bern, Lucern, Uri, Schwitz, Unterwald, Zug, and Glaris. These eight every two years alternately appoint a bailiff, who resides at Frauenfeld; and since the year 1499, the cantons of Freyburg and Solothurn have also obtained a seat in its criminal court.

Of the places within this country, some are immediately under the eight cantons; but the greatest part belong to spiritual and temporal justiciaries, who in their respective lordships and places, are possessed of the lower jurisdiction, and every year hold a meeting at Weinfelden, in which an officer presides who is elected by the cantons from among the persons proposed by the justiciaries out of their own body.

The principal places in this bailiwick are the following:

Frauenfeld, in Latin Gynopedium, is seated on an eminence near the river Murk, over which it has a bridge, at about an hour's distance from the place where it joins the Thur. In the mansion-house here resides the bailiff of Thurgau. The greatest part of the inhabitants are Calvinists, and within the town are two churches, one for each sect; but the mother-church stands at a small distance, at a place called Oberkirch, where also the Popish priest resides, and the dead of both communions are interred. In the council-house are usually held the general meetings of the cantons for auditing the annual accounts, especially for those cantons that are possessed of the regency of the German districts of Thurgau, the Reinthal, &c. Here is also a Capuchin convent, which contains a church.

The regency consists of a lesser council, composed of twelve members, and a greater council of thirty, including the above twelve. Two parts of these councils are of the Calvinist religion, and one Popish. The principal persons in the council are the prætors, one of whom is always a Protestant, and the other a Papist, who act alternately. These two prætors with a Calvinist burgher, all chosen by the whole body of the burghers, are stiled the three counsellors.

Arbon, or Arben, a town in the prefecture of the same name, is situated on the lake of Constance, and is supposed to be the Arbor Felix of Antoninus. Most of the inhabitants are Calvinists; but the rest, a few Lutheran families excepted, are all Papists. It has but one church, which the Calvinists and Papists make use of alternately, and the Lutherans also attend the divine worship with the former. In the mansion-house resides the bailiff belonging to the bishop of Constance, who has a seat both in the council and the town court, whenever cases of trespasses, or life and death are to be tried there; on occasion of enacting any new laws, or issuing a new edict; but has no vote, the civil and criminal jurisdiction being vested solely in the town. The president both of the council and town court is stiled the amman, who is nominated by the bishop, and every year presented to the whole body of the people by that prelate's bailiff. This officer must be a Papist; but has no vote. The town council is composed of six Calvinist, and a like number of Popish members; but the town clerk is always a Protestant. This council has the direction of the affairs of the town, and takes cognizance of every thing punishable by the laws. Its members are annually elected in the presence of the town amman

and clerk, out of the counsellors and deputies of both communions, and confirmed by the bishop of Constance.

SECT. XVIII.

Of the Bailiwicks of Rheinthal and Sargans, subject to the Swiss Cantons; with a particular Description of the Baths of Pfeffers.

THE bailiwick of the Rheinthal, or Rhein Vale, lies on the Rhine, which is its eastern boundary, and in this part enters the lake of Constance; to the southward it borders on the canton of Zurich; to the westward on the canton of Appenzel, on which side also a small tract of it terminates on the territory of the abbot of St. Gall; and to the northward it is bounded by the lake of Constance. It is divided into the Upper and Under Rhein Vale.

The soil is fertile, and produces a great deal of excellent wine, the first vines being planted here so long ago as about the year 918. At the foot of the Camor or Gamor-hill, in the Upper Rhein Vale, is a famous crystal-pit, in which are found many thousand quintals of yellow, brown, and white crystal, all hard and transparent.

In this whole tract are only two towns. The greatest part of the inhabitants are Calvinists, and compose nine parishes, whose ministers are chosen from the university of Zurich.

The inhabitants of Appenzel purchased this land-gravate in 1460; but in 1490 were obliged to cede it to the cantons of Zurich, Lucern, Schwitz, and Glaris, which at the same time admitted those of Uri, Unterwald, and Zug, into a participation with them; as in 1500 they also did Appenzel; and in 1712 all the eight cantons concurred in paying the same mark of regard to Bern. Thus the territorial sovereignty belongs to nine different cantons, which alternately appoint a bailiff over it every two years, who resides at Rheinec; but the abbot of St. Gall enjoys half of the juridical power, and the greatest part of the revenues of the Upper Rhein Vale come into his coffers.

The whole country is divided into five courts, over each of which are two ammans, one appointed by the nine cantons, and the other by the abbot above-mentioned. The latter is also possessed of the lower jurisdiction in the Upper Rhein Vale, and in civil processes an appeal lies from the courts to the abbot's council at St. Gall.

The principal places in the Rheinthal are the following:

In the Upper Rheinthal is Altstetten, a small town, in which the abbey of St. Gall is possessed of the lower jurisdiction, and some particular prerogatives, which are exercised by an amman and twelve judges. The first of these officers is chosen out of three select persons among the burghers. From the courts in this town causes are removed to the aulic-council of St. Gall; and of the amercements, one third belongs to the regent cantons, one third to the abbey of St. Gall, and the other third to the town. At Altstetten is also held the criminal court for the Upper Rhein Vale, at which the twelve judges of the town assist, in conjunction with those of other courts. The inhabitants are intermixed, some being Calvinists, and others of the Romish church. In 1410 the town was sacked and laid waste by the Austrians, and it has never since recovered its former grandeur.

In the Lower Rhein Vale the only town is that of Rheinec, a small place seated on the Rhine, but the capital of the Rhein Vale, and the residence of the bailiff of the cantons. This officer dwells in the bailliage-house, the seat which stood above the town being fallen to ruin. In 1410 and 1445 this town was destroyed by fire.

The country of Sargans is seated on the Rhine near the country of the Grisons, and, though very mountainous, breeds great numbers of fat cattle, while the valleys produce grain and fruit. In the lofty mountain of

Gunz

Gunz are found three species of ore, black, red, and ash-coloured, which on fusion, after a proper mixture, without any other process, yield a genuine steel.

In this country are two towns, the inhabitants of which are partly Calvinists and partly Papists. The former have their ministers from the university of Zurich, and the latter in ecclesiastical affairs are under the bishop of Chur.

This country was antiently subject to the counts of Werdenberg, from whom it was alienated; but in 1436 reverted to them again. The people then entering into a perpetual community of rights with the city of Zurich, the count, in 1437, also formed a perpetual community of territorial rights with Schwitz and Glaris, and permitted the castles of Freudenberg and Neidberg to be garrisoned with Austrians. This alarming both the inhabitants of this country and the city of Zurich, the latter instantly marched two thousand men into the country, who laying siege to the two castles, took and demolished them. On this count Henry of Werdenberg mortgaged the whole country to the cantons of Schwitz and Glaris, for the sum of eighteen hundred florins, with a view of setting them at variance with Zurich. Accordingly they came to an open rupture, but a peace was soon concluded, and in 1485 George count of Werdenberg sold this country to the seven old confederate cantons, which in 1712 admitted Bern to a share of the regency. These eight cantons send in their respective turns a bailiff to Sargans.

The principal places in this country are,

Sargans, the capital, which is seated near the Rhine, and is the residence of the bailiff sent by the cantons, who chooses an avoyer, who is always a burgher of the town.

Pfeffers, in Latin Fabarium, and in French Faviere, is famous for its rich Benedictine abbey and its baths. The former stands on the river Caminge, about two leagues from Sargans on a high mountain, and its abbots are stiled princes of the empire; yet the cantons, being sovereigns of the country, are both inspectors and protectors of the abbey and its territories. The baths are seated in a valley at the bottom of two steep rocks or mountains, through which the river Tamin rushes down with a frightful noise. The crags of the rocks advance so as to form a kind of arch. The descent to the baths was first by ropes, as into a well; afterwards a passage was made down to them by wooden bridges fastened to one another, and suspended between the rocks, and then with infinite labour they built the bagnios and lodging-rooms; but they were so darkened by the rocks, that they were forced to light up candles in them at noon-day. In 1629 these buildings were all burnt down, and next year the abbot caused others to be erected, in a pleasanter and more lightsome place, by cutting passages in the rock, erecting wooden bridges, where the earth was wanting, and making an aqueduct to bring the water from the spring to the bathing-rooms; so that now they have commodious lodgings, and always good company. The water is perfectly clear, without either taste or smell. It generally rises about the beginning of May, and goes quite away about the middle of September, except after very dry winters, when it does not rise till the middle or end of May, and then goes off later in the year. They are informed of its approach by little bubbles of water coming up in the great basin of the bath, and soon after it suddenly flows with a great noise with a stream sufficient to turn a mill. It is impregnated with the spirits of sulphur, nitre, vitriol, and of several metals, particularly gold. It is hot in the second degree, and good against several distempers, particularly obstructions of the brain and nerves, pains in the head, epilepsies, apoplexies, deafness, weak eyes, palsy, obstructions of the viscera, fistulas, ulcers, &c.

With respect to the abbey, though it is on a high mountain, it stands in the midst of a fine plain, shaded with woods, and intermixed with meadows. It was entirely destroyed by fire in 1665; but rebuilt with greater magnificence, and lined with black marble, streaked with white, from the ground-floor to the roof.

S E C T. XIX.

Of the Bailiwies of Gaster, Utnach, Gams, and the Town and District of Rapperschweil, subject to the Swiss Cantons.

GASTER, or Gastal, in Latin Castra, borders to the eastward on the country of Sargans; to the southward on the lake of Wallenstadt, and the cantons of Glaris and Schwitz; to the westward on Utnach; and to the northward on the territory of Tockenbourg. It is in some parts mountainous; but is very fertile. This country was mortgaged by the house of Austria in 1438 to the canton of Schwitz and Glaris, which still continue in possession of it. These two cantons, as sovereigns of the district, govern it by a bailiff, who holds his office two years, and is appointed by them in turns. With every new bailiff the people renew their homage, and that officer swears to maintain the liberties of the country. With respect to the canton of Glaris, it is observable, that when that canton nominates a bailiff, he is only chosen by the Papists out of their own body. His officers are an under-bailiff, who is elected by the regent cantons, with a treasurer, a recorder, a serjeant, and a messenger chosen by the people.

The country court is composed of nine judges, who, in conjunction with a bailiff, as president, annually hold three sessions in the town-house of Schanis to decide civil causes without appeal, and impose fines for petty trespasses; but in amercements for greater crimes, one half belongs to the town, and the other half to the regent cantons.

The principal place in this country is,

Schanis, or Schennis, a town situated on the banks of the Linth, or Lint. It has a church and council-house, with an abbey for ladies, the abbess of which is reckoned a princess of the empire; and though the ladies under her inspection are permitted to marry, yet she must devote herself to a single life. The patronage and sovereignty of this abbey, which has very large possessions, is vested in the two regent cantons.

The district of Utnach lies between Gaster, Tockenbourg, the cantons of Zurich and Schwitz, and the territory of the town of Rapperschweil. It was once a county of itself, which was mortgaged by the heirs of Frederic count Tockenbourg to the cantons of Schwitz and Glaris. The inhabitants of this district, as well as the former, are of the Romish religion; and the above cantons, every two years, appoint a new bailiff over it, who is presented to the people at Utnach; and upon this occasion they renew their homage.

It contains only Utnach, a small town, which has a prætor and council of its own, with five or six villages.

The county of Gams is very small, and lies between the counties of Werdenberg and Tockenbourg, and the lordship of Saxe. In 1497 the inhabitants put themselves under the protection of the cantons of Schwitz and Glaris, with the reserve, however, of their liberties; and it is, like the former, governed by a bailiff. It contains only a village or two, and a few scattered houses.

The town of Rapperschweil, with its precinct, terminates on the lake of Zurich, the canton of the same name, and Utnach.

The town of Rapperschweil, in Latin Ruperti Villa, stands on an eminence, near the above lake, over which it has a bridge eighteen hundred and fifty paces in length, reaching to a point of land which advances a great way into the lake. The town has some fortifications, with a pretty strong castle. The inhabitants both of the town and its precinct are of the Romish church, and in ecclesiastical affairs subject to the bishop of Chur, who has a Capuchin convent here. Its magistracy consists of the little and great council, the former of whom are composed of twelve, and the latter of twenty-four members. It was subject to the house of Austria, but in 1464 the inhabitants put themselves under the protection of the cantons of Uri, Schwitz, Underwald, and Glaris, with a reserve, however, of its liberties; yet these were at last seized, but in 1712 were restored, and the country

now remains under the sovereignty of Zurich, Bern, and Glaris.

SECT. XX.

Of the County of BADEN.

Its Situation, Rivers, and Produce. The Manner in which it became subject to the Swiss. Its Government, a Description of the City of Baden, and of its Baths.

THE county of Baden is seated in the Argau, or Ergow, being bounded on the west by the river Aar; on the north by the Rhine; and on the south and east by the canton of Zurich; though several villages belonging to it lie on the other side of the Aar and Rhine. The Limmat passes almost directly through the center of the country, and mingles with the Aar, which a little before its conflux with it is joined in this district by the Reus.

The whole territory in general abounds with fruit and grain, particularly on the Limmat and Aar, where it produces good wine: it likewise yields great quantities of good iron ore.

In this tract are only three towns. The greatest part of the inhabitants are Papists, under the jurisdiction of the bishop of Constance, and the rest are Calvinists, except a few Jews, who are tolerated.

This country antiently belonged to the dukes of Austria, but in 1415 the archduke Frederic being put under the ban by the empire, and excommunicated by the council of Constance, the inhabitants of Schwitz made themselves masters of the town and county; on which the emperor Sigismund mortgaged it the same year to the city of Zurich, for four thousand five hundred guilders; and that city, out of mere social friendship, admitted the cantons of Lucern, Schwitz, Underwald, Zug, and Glaris, into a share of the mortgage; and afterwards the city of Bern and the canton of Uri received the same mark of regard. These eight old confederate cities and cantons were proprietors of this county, over which they every two years alternately appointed a bailiff, till the Tockenburgh war in 1712, when the regent Catholic cantons of Lucern, Uri, Schwitz, Underwald, and Zug, having thrown a garrison into the town of Baden, the cities of Bern and Zurich made themselves masters of it, and the five above-mentioned Catholic cantons, at the peace of Arau, gave up their share in the regency of the county, Glaris alone excepted.

Thus the cities of Zurich and Bern possess seven parts of the regency of this county, the eighth belonging to Glaris. By virtue of this right the former nominate the bailiff fourteen years successively, after which Glaris takes its turn for two years. The above two cities have, however, each their option, whether the bailiff so nominated shall continue during seven years, or another be appointed at pleasure.

The bailiff resides in the town of Baden; but judges only in such civil causes as are brought before him by appeal from the courts which are held almost in every village, and the members are elected from among the several parishes, the under-bailiff sitting as president.

Baden, the capital of this country, is situated on the Limmat, over which it has a bridge, which, though of considerable length, has neither walls nor rails to it. The town is seated in the forty-seventh degree thirty-five minutes north latitude, and in the eighth degree fifteen minutes east longitude, between two very high hills on both sides the river, and has two castles; the new one lies on the other side the Limmat, opposite the town, and is the residence of the bailiff, for whose convenience, in 1734, great improvements were made. The council-house consists of two buildings; in one, are held the assemblies of the cantons in general, who meet for that purpose in a very handsome room. The deputies of Zurich have the most honourable seat at a little table at the upper end of it, having the ambassadors of the foreign powers on the right and left, and the deputies of the other cantons ranged below them on both sides. They all sit and are covered, except the bailiff of Baden, and his deputy, who stand all the while uncovered; but

when the suffrages happen to be equal, the bailiff is allowed the casting vote. In the other building the particular councils and courts of Baden meet. To the Papists belong the church of the Assumption of the blessed Virgin, which serves as a canonry; a convent of Capuchins, and a nunnery; and they have another church on the road to the baths. The Calvinists assemble in a church built by them in 1714, which stands also on the road between the town and the baths.

These baths, to which the grandeur of this city, as well as its origin, is chiefly owing, were famous so long ago as about the time of our Saviour. These baths are about a quarter of a mile below the town, on both sides the river Limmat. The largest of them are at Imrapen, a pretty little borough, which consists of handsome houses seated on an eminence, and has a church dedicated to the Three Kings. It is computed that the water is conveyed by no less than sixty canals to the several inns and private houses. They come from several springs by the side of the river, and it is said from one in the midst of the river itself. The waters are hot in the third degree, being impregnated with a great deal of sulphur, with a mixture of allum and nitre. The springs always rise the same, without increase or decrease; but are thought to have most virtue about the beginning of May and September, because they then abound most with the flowers of the sulphur.

The water is good for drinking as well as bathing, and recommended for the cure of distempers, not only of the hot kind, as fevers; but for those proceeding from cold humours, pains in the head, vertigoes, &c. disorders in the breast and bowels, asthma, obstructions, and particularly the disorders peculiar to women. In the center of the place is the poor's bath, called St. Verena's, formed by a spring that rises in the very middle of the street. Here the poor people bathe in a place quite open to the street, and its water being esteemed a cure for sterility in women, it is said that scarce any young woman of distinction marries in this county without making it an article in the marriage-contract, that her husband shall take her every year to the baths of Baden, the ladies being here permitted to wear those dresses, and allowed those diversions, that are prohibited in other parts of Switzerland. Blainville observes, that those who bathe in the public baths, who are generally such as cannot afford the expence of the private ones, have their shoulders cupped in them, and that instead of cupping-glasses, they use large horns of rams or bucks; so that in these baths are sometimes seen two or three hundred naked persons of both sexes with horns on their shoulders. The people who stay at Imrapen for the use of the baths, are obliged to buy the water they use for drinking and dressing their victuals, it being brought from Baden, or some springs on the other side of the Limmat, the water of that river being always thick and muddy, from the rapidity of its course among the rocks and sand.

The harbour on the river belongs to the town; but the customs to the cantons of Zurich and Bern. The inferior magistrates are appointed by the governor or bailiff, and these, with the judges of each district, decide causes in his name; but capital causes are determined by twenty-four judges, who are chosen out of the whole county by the bailiff; but he has power to mitigate their sentence. The great council consists of forty members; but the lesser, which is only of twelve, and included in the greater, decide all causes civil and criminal; and these two councils choose the prætor, the treasurer, and other magistrates.

SECT. XXI.

Of that Part of the Countries subject to the Swiss termed the Free Provinces; their Situation, Extent, Produce, and Government; with a Description of the free independent Towns of Bremgarten and Mellingen.

THE Free Provinces contain a tract of land and certain villages lying along the river Rufs, which traverses all the eastern border of this country,

try, which is bounded towards the north by the county of Baden; to the eastward by the cantons of Zurich and Zug; to the southward by that of Lucern; and to the westward by the cantons of Lucern and Bern.

This country produces an extraordinary plenty of grain and fruit. The inhabitants are of the Popish religion, and in spiritual affairs are subject to the bishop of Constance. The inhabitants were formerly free; but at length became subject to the house of Austria; but the emperor Sigismund having in 1415, put Frederic arch-duke of Austria under the ban, and engaged the Helvetic confederates to invade his territories, the troops of Lucern alone took possession of the greatest part of the Free Provinces, and were for retaining them; but were opposed by the cantons of Zurich, Zug, Schwitz, Underwald, and Glaris, who claimed their respective shares, as having taken the field at the time they were conquered; it having been previously agreed, that what any one or more cantons should conquer after the others were in the field, should be esteemed conquered by the whole body. This produced a contest that lasted ten years, till at length, in 1425, Bern ceded the Free Provinces to the cantons of Zurich, Lucern, Schwitz, Underwald, and Glaris. Uri also resigned all share in them; but in 1532, that canton was admitted into the co-regency. At the second peace of Arau in 1712, it was agreed that a boundary line should be drawn from Lunkhofen to Farwangen, and that all below it should be the property of Bern and Zurich alone; but that all above it should continue in the possession of the seven cantons to which it had been hitherto subject, though Bern was afterwards received into the co-regency of the same department. Thus the Free Provinces have ever since been divided into the Upper and Lower.

The Upper Free Provinces lie to the south of the boundary line, and their government is vested in the eight old cantons of the confederacy, that is, in Zurich, Bern, Lucern, Uri, Schwitz, Underwald, Zug, and Glaris, the last of which every fourteen years appoints a bailiff over them. This officer, however, instead of residing there, visits them only in spring and autumn, when the courts are held; on which occasion he lodges at the convent of Muri, and the commandery of Hitzkirch, where, without any colleague or assistant, he decides all causes brought before him, and inflicts penalties on delinquents. In the interval also, if two parties desire his attendance, he repairs thither; but it is at their expence, as he does likewise on any important affairs that will not admit of a delay.

The first hearing of all civil causes is held at the courts of the several provinces, under the presidentship of the under-bailiffs. From these courts appeals are carried first to the bailiff, who passes his verdict singly; but if after this any of the parties think themselves aggrieved, they are at liberty to carry the cause before the deputies of the regent-cantons, and afterwards from these again to the cantons themselves.

In capital cases the recorder usually sends information of the criminals to the bailiff, who generally commissions him, in conjunction with an under-bailiff, to try them, for which purpose he orders a court to be held at the inn of Bremgarten, where he takes up his quarters, and in his absence, even to pass sentence on the convicts; but this sentence must be transmitted to him, either to be confirmed or mitigated. If it be death, he goes with the judges to the usual place of execution, which is in the high road between Bremgarten and Wollen, where the sentence is openly pronounced, after which the execution immediately follows.

The Lower Free Provinces, which lie on the north side of the boundary line, have since the year 1712, been under the sovereignty of Zurich and Bern, Glaris only retaining the seventh part, which belonged to it before, and every fourteenth year putting in a bailiff for two years; whereas Zurich and Bern are possessed of that privilege every two years alternately. The proceedings here, both in civil and criminal cases, and in every thing relating to the government, are the same as in the Upper Free Provinces.

We shall now give some account of the towns of Bremgarten and Mellingen, or Meldingen.

Bremgarten is situated on the river Reus, between the Lower Free Provinces and the county of Baden, eight miles to the north of Zug. The town is divided into Upper and Lower: the former stands high; but the latter, in which is the parish church, with a Franciscan nunnery, is seated on the bank of the Reus, over which it has a bridge, and at the farther end of it a Capuchin convent. It is a place of great trade, particularly in making paper. The inhabitants are of the Romish church, and within the diocese of Constance. The town, which was formerly imperial, has undergone several revolutions, and is now subject to the cantons of Zurich, Bern, and Glaris. The regency consists of the little and great council; the former is composed of twelve members, among whom are two prætors or avoyers, who, when they enter upon their office, take a formal oath of fidelity to the deputies of Bern, Zurich, and Glaris, at the next annual meeting for auditing the public accounts. The great council consists of forty members, out of whom is elected the town court, appeals from which are first carried to the little and great council, and from thence to the deputies of the regent cantons at the annual meeting; and lastly, even to the cantons themselves. All criminal and capital cases are immediately tried before both councils, the town being possessed of the privilege of beheading and hanging.

Mellingen is a little Popish town, with one church, seated on the river Rufs, and is at present subject to Zurich, Bern, and Glaris. The ingenious Mr. Addison, who visited this town, gives a more particular and a more entertaining account of it than any author we have seen. It contains, says he, an hundred citizens, and about one thousand souls. The government is modelled after that of the other cantons, as much as it is possible for so small a community to imitate those of a large extent: for which reason, though they have but little business, they have all the variety of officers and councils that are to be found in the greater states; they have a town-house, adorned with the arms of their protectors, and three councils; the great council of fourteen, the little council of ten, and the privy-council of three. The chief persons of the state are the two avoyers; and when our author was there, the reigning avoyer of the commonwealth was son to the inn-keeper where he lodged, the father having enjoyed the same honour before him. The revenue of this high post amounts to about thirty pounds a year. Every Thursday, he adds, the several councils meet upon affairs of state, as the repairs of a trough, the mending of a pavement, or the like important business. A river which runs through their dominions puts them to the expence of a very large wooden bridge, which is covered over-head like the rest in Switzerland. All who travel over it pay a certain toll for its maintenance, and the French ambassador frequently passing this way, his master allows the town a pension of twenty pounds sterling a year; on which account they are extremely industrious in raising all the men they can for his service. The preserving this bridge, and the regulation of the dues arising from it, are the grand affairs that cut out employment for the council of state.

There are also the four districts of Schwartzenburg, Murten, Grandson, and Eschalens, which are subject to Bern and Freyburg, who alternately appoint prætors over them, whose office lasts for five years; but these are little districts that contain no place of any consequence.

S E C T. XXII.

Of the seven Italian Bailiwicks subject to the Swiss Cantons, namely, Bellinzona, Riviera, the Valle di Blegno, Lugano, Locarno, Val Maggia, and Mendris.

IN the seven Italian bailiwicks the inhabitants are universally Papists, and speak the Italian language. The three first of these belong to the cantons of Schwitz, Uri, and Underwald; and the other four to the cantons

in general, excepting only Appenzel, which at the time of their acquisition was not a member of the confederacy.

The first of these is the bailiwick of Bellinzona, which is bounded on the eastward by the Upper Grisons and the duchy of Milan, to the southward by the bailiwick of Lauis and Locarno, to the westward also by Locarno, and to the northward by the bailiwick of Riviera.

A part of it is watered by the river Ticino, into which the Mæsa discharges itself. The hills and mountains afford excellent pasturage for cattle, and likewise abound in chesnuts; and the plain near Bellinzona produces good wine. All the parishes, three excepted, which are in the diocese of Milan, are under the bishop of Como.

In the year 1500 the town of Bellinzona submitted to the cantons of Uri, Schwitz, and Underwald; and three years after it was ceded to them as their absolute property by Lewis XII. king of France; and this cession was ratified by Maximilian Sforza, duke of Milan, in acknowledgment of their having restored him to his duchy. Every two years these cantons alternately nominate a steward, or bailiff, under the title of commissary, which is always the person whom the two preceding years had discharged that office in the bailiwick of Riviera. Every year too each of the regent cantons sends a deputy to Bellinzona, to audit the commissary's accounts and hear appeals, and to transact other public affairs.

The principal place in this bailiwick is,

Bellinzona, or Bellentz, a large, trading, and well fortified town, situated in a plain near the conflux of the Ticino and the Mæsa. Almost in the center of a large square stands the mansion-house of the commissary. The collegiate and abbey church of St. Peter and St. Stephen is a handsome building, and in the suburbs without the town are two convents and one nunnery, each having its church, besides an edifice called the Residence, which has been converted into a college, in which the abbey of Einsiedlen appoints professors for the instruction of youth in humanity and moral theology. The town stands between three hills that command it every way, and have each a strong old castle fortified in the antient taste, and provided with cannon. In one of them resides the castellan of Uri, in the second the castellan of Schwitz, and in the highest that of Underwald.

The bailiwick of Riviera, or Polese, is bounded on the south by the bailiwick of Bellinzona; to the westward on that of Locarno, or Lugarus; to the northward by the Valle di Blegno and Liviner; and to the eastward by the Upper Grisons. This district is watered by the Ticino, which in these parts receives the Blegno. It came to the cantons of Uri, Schwitz, and Underwald, at the same time, and is governed by them in the same manner with the bailiwick of Bellinzona. Within its jurisdiction are only nine parishes, the town of Riviera, and a few villages.

The bailiwick of the Valle di Blegno, otherwise called di Bregno, is bounded to the southward by the district of Riviera, to the westward by the Vale of Liviner, and to the north and east joins to the country of the Upper Grisons. It is environed by lofty mountains; but the barrenness of some of them is made up by the fertility of others. The length of this territory, according to Busching, is not less than seven hours, all watered by the Blegno; but its breadth does not much exceed half that space. It feeds multitudes of cattle, and yields several kinds of grain and fruit, especially chesnuts and tolerable wine; but in summer the men remove to Italy to earn money by working in the fields, leaving all their work at home to the women. In the year 1512 this Valley suffered extremely by the fall of two mountains, which stopping up the course of the river, it swelled to that degree that the far greatest part of the vale became a lake; and this inundation lasted till the year 1514, when the waters forced themselves a passage.

About the year 1500 the inhabitants submitted to the canton of Uri, though with a reserve of their liberties, and that canton admitted Schwitz and Underwald into a co-regency. These several cantons every two years alternately appoint a bailiff over it; but the ecclesiastical

affairs of this district are only cognizable by the archbishop of Milan. It is divided into three parts, each of which contains several villages.

The bailiwick of Lugano, by the Swiss called Lauis, is on all sides surrounded by those of Locarno, Mendris, Bellinzona, and the duchy of Milan. To it belongs the greatest part of the lake of Lugano, which is about seven miles long, and three broad, exclusive of its many little bays. The country itself, in which are no less than a hundred and six populous burghs and villages, was in 1512 conferred on the confederate cantons in general, which at that time were twelve in number, by Maximilian Sforza, duke of Milan, in return for the effectual assistance they had granted him against the French; and accordingly they every two years appoint a governor over it, under the title of capitaneo. It is divided into four quarters, three of which, in ecclesiastical concerns, are under the bishop of Como, and the other under the superintendency of the archbishop of Milan.

The bailiwick of Locarno, or Lugarus, is situated between the Milanese, the Mayenthal, the Livinerthal, and the bailiwicks of Riviera, Bellinzona, and Lauis, comprehending also a part of the Lago Maggiore. It has three or four fruitful valleys, and fine rivers that run into the lake, and is divided into four communities and forty-nine parishes. It came to the twelve allied cantons in the same manner and time with Lugano, and its government is the same. Its capital is of the same name, besides which it has a town called Ascona, and a few villages.

Val Maggia, or the Mayenthal, is surrounded by the duchy of Milan, the Liviner Vale, and the Captainry of Locarno. It is thirty-three miles in length, and derives its name from the river Maggia, which traverses it. It came to the twelve confederate cantons at the same time, and in the same manner as the above-mentioned bailiwicks, and those cantons every two years appoint a bailiff over it. It contains the towns of Cevio, or Civio, and Maggia, with a few villages.

The last of these bailiwicks is that of Mendris, which is surrounded by the duchy of Milan, and a part of the bailiwick of Locarno. This also came to the twelve United Cantons at the same time, and in the same manner, with the three preceding districts, and accordingly they every two years alternately appoint a bailiff over it. In this country is a town of the same name, and several villages.

We shall now proceed to the associated countries, summoned to the legislative diets of Switzerland in quality of allies, and that have a vote in those assemblies. These are the abbey of St. Gall, the country of the Grisons, with their subjects, the principality of Neuchâtel, and the republic of Geneva. We shall begin with the former.

S E C T. XXIII.

The Territories of the Abbey of ST. GALL.

Their Situation and Extent: a concise Account of the Abbey, with the Prerogatives and Arms of the Abbot; their Government and principal Places, with a particular Description of the City of St. Gall, a small Protestant Republic independent of the Abbey.

THE abbey of St. Gall, which is of the Benedictine order, is included within the same walls as the town of that name, but has very considerable territories, and the abbot is capable of raising an army of twelve thousand armed men, he being sovereign of the whole country, and under the protection of the cantons of Zurich, Lucern, Schwitz, and Glaris.

This country is divided into the Old Territory, also called the territory of the people of God's house, and a district called the county of Tockenbourg; the former is bounded on the east by the lake of Constance and the Rhein Vale, on the south by the canton of Appenzel, on the west by Tockenbourg and the Thurgau, and on the north also by the latter; it being fourteen miles long and ten broad. The soil bears a near affinity to that of Thurgau, and its inhabitants are Popish.

Till the year 1567 this abbey was parted from the city only by a single hedge; but afterwards, by a particular agreement, it was divided by high walls, in which is a gate opening into the city, and another towards the territories of the abbey. Within the circuit of this convent is the minster abbey church, in which, among the bones of other lords, are kept those of St. Gallus, the original founder of the abbey; and adjoining to it is St. Othmar's church, in which are preserved the relics of that saint. Next to these are the palace of the abbot, with the convent itself, in which are usually upwards of sixty monks, and a library famous for its antient and curious manuscripts. The abbot is chosen by the monks of the abbey from amongst themselves, and instantly becomes a prince of the empire, immediately subject to the pope himself. On his accession to his dignity he is, by a grant from the emperor, invested with the regalia, and sief over the old territory belonging to the abbey, and the county of Tockenbourg; but does not assist at the diets of the empire. On the other hand, by virtue of the perpetual community of defence entered into with the confederate cantons of Zurich, Lucern, Schwitz, and Glaris, the abbey was admitted as an incorporated place, and enjoys both a seat and voice in the general meetings of the confederacy which are granted to its deputies, immediately after those of Appenzel.

The arms of the abbot are quarterly, in the first field dexter a bear rampant sable, for the abbey: in the first field sinister, azure, an *agnus Dei*, argent, for the abbey of St. John: in the second dexter field, the family arms of the abbot; and in the second sinister or, a dog sable, with a collar argent, for the county of Tockenbourg.

Formerly the abbey had the duke of Swabia for its steward, the counts of Hohenzollern for its grand marshal, the counts of Hochberg for its arch-cupbearer, and the baron of Regensberg for its high-chamberlain; but these offices are at present borne by other persons of distinguished rank.

In the old district, and the county of Tockenbourg, the bishop of Constance is vested with all episcopal rights and emoluments, in conformity to the privileges granted by several popes. The abbot of St. Gall enjoys, however, not only the disposal of all the convents belonging to him, but likewise of all benefices, both in the old territory, the county of Tockenbourg, and within his districts in Thurgau and the Rhein Vale. To him likewise belongs the jurisdiction in civil, criminal, and mixed cases, with the visitation, &c. but the greatest part of these prerogatives he exercises by a representative, who is always a monk of the abbey. He has also an ecclesiastical court for the decision of religious contests, which, besides the above representative, who sits as president, is composed of four conventuals, and some lay-assessors.

The members of the aulic-council at St. Gall, are the dean of the abbey, who sits as president, the stadtholder, three conventuals, and some laymen. This council hears appeals from the lower courts within the jurisdiction of the abbey; but decides without appeals, only an order may be obtained from the abbot for a revival.

The chief town in the abbot's antient territories is Rorschach, which is seated in a pleasant fruitful country by the side of the lake of Constance, opposite to Lindaw. It has many fine houses in proportion to its extent, with a good harbour, and great markets frequented by multitudes of people from all the towns and villages round the lake; and a considerable trade is carried on in linen, corn, fruit, cattle, and good wine. In 1499 this place being attacked by four thousand Imperialists, was defended by two thousand burghers, who fought with the utmost intrepidity till they were all cut to pieces, and then the town was taken and burnt; but by degrees it rose again, and the houses were rebuilt with free-stone. By the side of it is a magnificent convent on an eminence that commands the town, and above the convent is an antient fort belonging to the abbot. There is here also a college for the instruction of youth.

The county of Tockenbourg is surrounded by the antient territory of the abbey of St. Gall, the Thurgau, the canton of Zurich, the districts of Utnach, Gaster, and Bargans, the lordship of Werdenberg, and the canton of

Appenzel, and is, according to Dr. Busching, ten hours in length, and its greatest breadth three.

The soil resembles that of Appenzel and other cantons, and the country is full of fertile mountains that abound in numerous breeds of cattle. The militia here form a body of about nine thousand men, two thirds of whom are Calvinists, and one-third Papists. The Papists in the upper part of the country are under the bishop of Chur; but in the lower part within the diocese of Constance.

The abbot of St. Gall bears the title of natural sovereign and lord of the country of Tockenbourg, and the people take an oath to him and pay him suitable services, but without any violation of their rights and liberties. He appoints a bailiff over the country, and may nominate either a native or a foreigner: he likewise puts in the recorder and serjeant, who must be natives and persons of estate in the country. The council is composed of thirty Papists, and the like number of Protestants, who are chosen by the parishes and districts. This council attends to the liberties of the people, conducts the public and private affairs of the country, imposes taxes, settles the military expences and those of any public improvements, and likewise audits the accounts of the parties concerned. This council meets once a year, and oftener when necessary. All males of fourteen years of age and upwards are summoned to take the country oath. The president of the country court is always the bailiff for the time being; but its twenty-four judges are appointed by the abbot, one from each of the twenty-two old parishes, and two from Lichtensteig and Watweil. This court is held in the abbot's name as prince, and takes cognizance of all causes; and being the prince's council, the salaries attending it are paid by the prince, to whom belong all confiscated estates and effects of malefactors executed, with those of suicides, and fugitives for capital crimes. Half of the judges of the inferior courts are nominated by the prince, and the other half by the parishes. The court of appeals has for its president the bailiff for the time being, but the twelve assessors must be natives of the county and landholders. The prince here nominates three Papists and three Calvinists, and the country council chooses a like number from among their own members.

Lichtensteig is the capital of the country of Tockenbourg, and is a small town seated on the river Thur. It is the residence of the bailiff, who dwells in the new mansion-house, and the old one is used for holding the country court and court of appeals; but the council of Tockenbourg, with the Calvinist synod, the matrimonial court, and the town-council, assemble in the town-house. The government of this place is vested in a prætor and a council, the former alternately chosen out of both religions; the same equality is observed in filling up the council and other posts.

We shall now return to the city of St. Gall, which is a little Protestant republic entirely independent of the abbot, and under the protection of the cantons. It is seated between two mountains in the forty-seventh degree thirty-one minutes north latitude, and in the ninth degree twenty minutes east longitude, two leagues to the south-west of the lake of Constance. It is situated near the river Steinbach, which drives several mills; but its moats receive their water from a rivulet called Iren. Here are spacious streets, good houses, and several public structures. The cathedral of St. Laurence is a parish church, and without the walls is another, with a chapel. Here was a convent dedicated to St. Catharine; but now converted into a gymnasium of nine classes, under the like number of masters assisted by two professors, and in this building is the city library. Here is also a town-house and an arsenal. Mr Addison observes, that it is surprising to find such a number of rich burghers in the city of St. Gall, and so few poor people, in a place that has scarce any lands belonging to it; but the wealth of this little state consists in its linen manufacture, in which people of all ages and conditions are employed. The adjacent country furnishes them with vast quantities of flax, of which they are said to make every year forty thousand pieces of linen cloth, reckoning two hundred ells to each piece, and some of it as fine and white as any that can

be found in Holland. This linen they send upon mules into Germany, Spain, Italy, and all the adjacent countries. In the city of St. Gall, and the houses scattered about it, there are computed near ten thousand souls, of which sixteen hundred are burghers, out of which body their councils and burgomasters, the town amman and stadtholders, are chosen, as in other governments of Swisserland, the difference consisting in little more than in the number of such as are employed in state affairs.

The military establishment is under the conduct of the council of war, and the burghers are divided into nine quarters, with a captain and proper officers to each; but the first officer is the town-major. Here are also a company of matrosses and bombardiers, with one of light infantry, two of grenadiers, and a troop of horse.

The town is generally thought to owe its original to the abbey, which it is certain has not a little contributed to its increase. The abbey and the town are said to have a great aversion to each other, and yet in the general diet of the cantons their representatives sit together and act in concert.

About four years before Mr. Addison's arrival, the city and abbey were on the point of coming to an open rupture. In one of their annual processions a Benedictine monk carried his cross erect through the town, followed by a train of three or four thousand peasants; but he had no sooner entered the abbey, than the whole town was in a tumult, occasioned by the priest's carrying the cross contrary to all precedence, in that manner. Instantly the burghers put themselves in arms, and drew down four pieces of their cannon to the gate of their abbey: upon which those who had formed the procession did not dare to return by the way they came; but after their devotions were ended, went out at the door that opened into the abbot's territories. The abbot, exasperated at this proceeding, raised an army, blocked up the town on the side that faced his dominions, and forbade his subjects furnishing it with any of their commodities. But while things were thus ripe for a war, the cantons, their protectors, wisely interposing as umpires in the quarrel, sentenced the town, for appearing too forward in the dispute, to pay a fine of two thousand crowns; and at the same time enacted, that whenever any procession entered their walls, the priest should let the cross hang about his neck without so much as touching it with either hand, till he came within the precincts of the abbey.

The town and abbey of St. Gall carry a bear in their arms. The Roman catholics have the memory of this bear in very great veneration, and represent him as the first convert made by their saint in this country. One of the most learned of the Benedictine monks, with tears of affection in his eyes, gave Mr. Addison the following history of him. It seems that St. Gall, who is here termed the great apostle of Germany, found all this country little better than a vast desert; and as he was walking out on a very cold day, happened to meet a bear, when instead of being startled at the rencounter, he gravely ordered the bear to bring him a bundle of wood, and to make him a fire; upon which the bear served him to the best of his ability, and at his departure was ordered by the Saint to retire into the very depths of the woods, and there to spend the rest of his life without ever hurting man or beast. From this time, added the monk, the bear lived irreproachably, and till his dying-day observed the order given him by the Saint.

S E C T. XXIV.

The Country of the GRISONS.

Its Situation, Extent, Produce, and Rivers. The Language and Religion of the Inhabitants; their History, Government, Manners, and military Forces: with a Description of the three Leagues, or Confederacies, into which this Country is divided, and the principal Places in each; with a particular Description of the City of Chur.

THE country of the Grisons is bounded on the eastward by Tirol and the territories of Venice; on

the south by the Italian bailiwicks, the Valteline, and the county of Chiavenna; on the west by the cantons of Uri and Glaris; and on the north by the canton of Glaris, the county of Sargans, and a part of Tirol; extending from east to west in its greatest length about eighty-five miles, and in its breadth from south to north about seventy-six.

The greatest part of the country is mountainous, but the levels and valleys produce almost all sorts of grain, with pulse, plenty of hay, fruits of several kinds, and wine. Its hills, which are of a middling height, and enjoy a mild air, yield not only good grass and hay, but also rye and barley, and in some parts cherries: even on the highest spots are good pasture-grounds, besides many kinds of palatable and wholesome berries.

The principal business of the inhabitants is the feeding of horned cattle, sheep, goats, and swine. They likewise export a great deal of butter and cheese; but the breeding of horses is so much neglected, that the greatest part of those used in the country are purchased of foreigners; the few that are bred there are hardy and laborious, but ill shaped. They have plenty of poultry and wild fowl; but the only fish worthy of notice are the eel-pout, and a few pikes. They have mines in several parts; but the produce of them is inconsiderable.

The principal rivers of this country are the Rhine, the Inn, and the Adda, all which have their source here. Besides these, there are some small rivers, or rivulets. Here are also several lakes, most of which lie on the summits of the mountains, where they rise from fine springs.

In the whole country of the Grisons are but three towns. The German tongue is not only used in their general state assemblies, and public instruments; but is also continually growing more and more in vogue. It is spoken at Chur, and in its territory, and almost everywhere in the Ten Jurisdictions. In many places the inhabitants speak both the German and Italian. The Roman or Chur Italian is principally spoke among the Grisons. At Engadin, the Ladinum, a kind of Latin, is the prevailing language; and at Pregel is a corrupt kind of Italian.

Both the Calvinist and Popish religions are by the laws entitled to an entire freedom. The professors of the first form about two-thirds of the inhabitants, and their clergy are divided into six *colloquiums*. In every league is a dean, and each *colloquium* has its own *praeses*. The deans are annually chosen by lot in a synod of the three leagues, which have also a college at Chur for the instruction of youth, each of which has its inspector, who is always a layman. The greatest part of the Popish clergy in the three leagues are under the see of Chur, and divided into chapters.

Every community is so entirely of one religion, that if any person changes his sentiments, he must go into another. The Papists in their processions sometimes go from one community into another; but when they enter those belonging to the Protestants they lower the cross, and leave singing till they are again upon popish ground.

The country of the Grisons is a part of the antient Rhætia. The people were formerly subject to several princes, some to petty sovereigns, some to the bishop of Chur, and others to the house of Austria, to whom the Rhætians behaved with such extraordinary fidelity, that the emperor Frederic II. rewarded them with a grant of several privileges and immunities. In 1419, the bishop of Chur, who bore great sway here, in conjunction with the city of that name, concluded an alliance of fifty-one years with the city of Zurich.

The free communities in this part of Rhætia, by a mutual compact among themselves, formed three republics, which are now called Leagues or Confederates: these go by the names of the Grey or Grison League, that of the House of God, and that of the Ten Jurisdictions. The first concluded its alliance in 1424; the second claims a more antient date; the third acceded to the union in 1436; and in 1471, the three leagues entered into a perpetual alliance with each other, which has been since ratified and explained.

The three leagues, by virtue of these engagements, form one united republic; but instead of one united common

mon coat or seal, each league has its particular arms; but in instruments that relate to the whole body, a seal is used that has the arms of the three united leagues. However, a general diet is annually convoked by the heads of the three leagues, and annually meet on St. Bartholomew's-day, one year at Ilantz in the Grey league, the next at Chur in that of God's House, and the third year at Davos in the Ten Jurisdictions. At the same time notice is sent to the several communities, of the affairs on which they are to send their plenipotentiaries with full powers. This general diet usually sits a fortnight or three weeks, and two deputies are sent from every community in each league, by which means the number of votes in the general diets amounts to sixty-six; of which the Grey league has twenty-eight, that of God's House twenty-three, and that of the Ten Jurisdictions fifteen; the chief of the league where the diet is held being always president.

In the general diet are discussed and regulated affairs of state, negotiations with foreign powers, and the decisions of all appeals. This diet likewise receives the public revenue, and administers the oaths to new officers of the provinces. However, in affairs relating to the whole united body, and to negotiations with foreign powers, no final resolution is taken; but at the rising of the diet, a committee of the heads of the three leagues, assisted by two representatives from each, is appointed for digesting the proceedings, and to determine what particulars are to be communicated to their several communities, either as resolved and enacted, or on which their opinions are desired. The resolutions of each community are formed by a plurality of voices, each community sending up its opinion in writing to the new congress.

The country of the Grisons is extremely populous; and as there are no people more free, so there are none more jealous of their liberty. Hence they have a singular method of punishing those suspected of treason, or of any crime against the state, which makes the greatest men in the country tremble. When the diet is assembled, the peasants flock to it in crowds, to demand a court of justice for the trial of the offender, which the diet is bound to grant. This court consists of ten judges, and twenty advocates of each league, who have the power of applying torture, and doing every thing necessary to discover the truth of the accusations. Its proceedings are vigorous and summary, and generally end in a sentence of death, or a heavy fine. In other respects the Roman law prevails among the Grisons, though somewhat modified by their customs. Thus a man who has an estate by his wife, enjoys it after her death till he marries again, and then is bound to divide it among the children he had by her.

The married women here scarce ever appear abroad except at church; but the young women have more liberty before they are married.

Though here is plenty of every thing, yet their habits and furniture are plain. With respect to their provisions, their meat is very juicy, their fowl excellent, and the fish of their lakes, especially their trouts, inferior to none in the world; and though the wine they drink is brought on horses four or five days journey, they have it cheaper than in most parts of Italy and France. The inns upon the mountains are very good, and besides good bread and wine, there is always a great quantity of game and venison, according to the season of the year, with neat chambers and good beds. There is nothing paid in this country for importation or exportation; but every one enjoys the fruit of his labour, and the revenue of his lands.

The three leagues have contracted friendly alliances with the neighbouring cantons and their associates. In 1600 they all entered into a perpetual league with the republics of the Valais, in 1602 with Bern, and in 1707 with Zurich. In 1497 the Grey league, and the next year the league of God's House, entered into a like engagement with Zurich, Uri, Lucern, Schwitz, and Glaris; and in 1567, the Ten Jurisdictions sued to be admitted into that alliance; but at a diet held at Baden received for answer, that though their application was not then complied with, yet the confederate cities and

cantons assured them of their ready friendship and services on all occasions, and in their instruments and letters stiled them confederates and allies.

The Grisons maintain no troops, and even apply themselves very little to the use of arms. But as they furnish foreign powers with regiments, they are never without experienced officers and soldiers, and on occasion the three leagues are able to bring thirty thousand fighting men into the field. But the principal strength of the country consists in its high mountains and narrow passes, in which a handful of resolute men are able to make head against a considerable army.

The Upper, or Grey league, which contains several high mountains, is bounded on the east by the other two leagues; on the southward by the duchy of Milan, and the bailiwick of Bellinzona; on the westward by the canton of Uri; and on the northward by the canton of Glaris and the bailiwick of Sargans.

In this league are eight communities, the principal town in which is the following:

Ilantz, in Latin *Ilantium*, a small town seated at the foot of a hill, between the Farther Rhine and the Glenner. This is the chief place in the Upper or Grey league, and every third year the general diet of the Grisons is held here, as are likewise the courts of justice. The inhabitants are Calvinists.

The league of the House of God, or, as it is called, *La Caddée*, from the Italian *Caddea*, a corruption of *Casa Dei*, probably owes its appellation to the bishopric of Chur. This country is bounded by the Grey league on the west; the county of Tirol, and that of Bormio on the east; the Ten Jurisdictions on the north, and the county of Chiavenna and the Valteline on the south. It is about sixty-seven miles in its greatest length, from the north-east to the south-west, and forty from east to west.

The soil is for the most part rugged and barren; yet about Chur and the banks of the Rhine, they have most sorts of fruit except oranges and olives.

The arms of this league are argent, a goat saliant and fable.

The principal place of this league is the following:

Chur, or Coire, in Latin *Curia Rhætorum*, and in Italian and Roman *Coira*, and in the language of the country Chur, is the capital of the whole republic of the Grisons, and is situated in the forty-sixth degree fifty-two minutes north latitude, and in the ninth degree thirty-two minutes east longitude; fourteen miles to the north-east of Ilantz; by the river *Pleissur*, which washes the walls of the city, and may be conveyed through all the streets, and about half a league before that river discharges itself into the Rhine. The east part of the city lies at the foot of a hill, as does the south part at the foot of another; but towards the north and west is a fine plain, beautifully diversified with corn-fields, meadows, orchards, and vineyards; and towards the north-east, an eminence, also covered with vineyards.

This city is of tolerable extent, and all the inhabitants are Calvinists. It has two churches, each containing a minister, one of whom, who officiates at the cathedral of St. Martin, is stiled *Antistes*. Besides these, it has a church set apart for funeral sermons, with a *collegium philosophicum* of two professors, founded in 1700 by the Calvinist communities of the three leagues, and over which every league nominates its own particular inspector. It has also a grammar-school of three classes. In the town-house every three years is held the general diet of the Grisons, as likewise the extraordinary diets and congresses. In the town-house are also kept the state-office and record-office of the House of God in particular, as well as of the three leagues collectively; and under it is a magazine for keeping the goods of the merchants passing to and from Italy and Germany. On the cloister square is the arsenal, in which are kept the artillery both of Chur and the whole state of the Grisons. Adjoining to this is the granary, in which a corn-market is held twice a week.

The finest private buildings here is the palace erected by Peter lord of Salis, to which belongs a most beautiful garden, and the house of the late burgomaster Otho Schwartz, which is built in the Italian taste.

The supreme power is lodged in the burghers, who are divided into five companies, and by proclamation from the council, meet on all deliberations relative to the state, in which every freeman of those companies is asked his opinion, the resolutions are taken according to the majority of the suffrages, and communicated in writing to the council. Whatever is approved by three companies, the other two must acquiesce in.

The great council consists of seventy persons annually chosen by the burghers; that is, fourteen out of each company, on the first Sunday after St. Crispin's-day. These seventy choose the lesser council, consisting of twenty persons. The principal person in the city is the burgomaster, who is annually elected by the free choice of the great council. The lesser council, with the addition of two ecclesiastics, constitutes the matrimonial court.

The origin of this city is involved in obscurity; but it gradually obtained all the immunities and privileges of an imperial city, and has from time immemorial been possessed of the right of coinage. The origin of the see of Chur is no less uncertain. The series of its bishops annually begins with Aimo, who is supposed to have lived about the year 440, and the see is generally held to be one of the most antient. The several communities of this part of the country of the Grisons, have acquired the right of protection over the see, and have shewn themselves on all occasions the courageous protectors both of the see and the bishops.

The bishop of Chur is a prince of the empire, and his title is, Bishop of Chur, of the holy Roman empire, lord of Furstensburg and Furstenau.

His arms are the same with those of the city, and the bishop enjoys a seat in the diet of the empire, and in the college of princes, sits next to the bishop of Lubec; but in church affairs he is under the jurisdiction of the archbishop of Mentz. He is elected by the chapter of Chur, which consists of twenty-four prebends. The bishop, with the chief of the prebends, that is, the provost of the cathedral, with the dean, scholasticus, cantor, custos and thesaurarius, live just without the city of Chur, on an eminence called the Hof, which is enclosed with walls and gates, and in which also stands the cathedral. The revenues of the bishop are, however, far from being so considerable as they were formerly.

The Ten Jurisdictions border to the south and east on the league of God's House; to the westward on the same league, and the county of Sargans; and to the north on Sargans and the principality of New Lichtenstein. This is the smallest of the three leagues, and consists of seven districts. It for the most part consists of rugged and desert mountains, and has no corn or other fruit, except in that part called the Vallis Rhætica, on the banks of the Rhine; but it has plenty of pasture, cattle, milk, butter and cheese, not only for their own use, but for exportation; and the lakes abound with fish, especially trouts. The air on the mountains is very cold, and the people often in danger from the snow and ice which fall from them.

The Ten Jurisdictions are Davos, Closter, Castels, Schiers, Mayenfeld, Bellfort, and Schanfig; the three last are each subdivided into two jurisdictions, which makes the whole ten.

The principal place in these Jurisdictions is,

Mayenfeld, or Meyenfeld, a pretty town in a fine country, which is the most fruitful of any belonging to the Grisons. It stands on the banks of the Rhine, with mountains rising round it like an amphitheatre, well planted with vines, which produce excellent wine. Besides its church, which is dedicated to St. Lucius, there is a castle, in which the bailiff resides, and several magnificent houses. The town has its separate council and civil government, and the bailiff is chosen for two years, alternately by the Grison leagues and the community.

SECT. XXV.

Of the Countries subject to the Grisons, viz. the Valteline, Bormio, and the County of Chiavenna. Their Situation, Extent, Produce, Government, and principal Towns.

WE now come to the subjects of the Grisons, who possess three fine countries at the foot of the Alps, near the entrance of Italy; these are the Valteline, Bormio, and the county of Chiavenna; the whole being, properly speaking, one valley, which extends to the foot of the Rhætian Alps, and is bounded on the east by Tirol, on the south by the dominions of Venice and Milan, and on the west and north by the country of the Grisons; extending about sixty Italian miles in length, but is very unequal in breadth.

We shall begin with the Valteline, in Latin Vallis Tellina, which lies between the league of God's house, the county of Bormio, the territories of Venice, the duchy of Milan, and the country of Chiavenna; extending upwards of thirty-eight miles in length, and in breadth from nine to twenty-three.

It is exceeding fruitful, and throughout its whole extent watered by the Adda, which discharges itself into the lake of Como. The sun-beams shine in every part of this valley, and it is fenced from the northern blasts by high mountains. In some parts the heat is intense, but in others more moderate; and on the hills and greatest part of the adjacent valleys the air is mostly cool. This difference in its temperature necessarily causes a variation in the products of the earth. The levels in this valley, through which the Adda pursues its meandering course, exhibit a pleasing variety of corn-fields, meadows, vineyards, and orchards of chestnuts and other fruit. The vineyards on the mountains towards the north produce the best wine in the whole country, and above them are corn-fields and pasture lands. The hills on the south side are covered with fine woods of chestnuts, and rich pastures, in which graze numerous herds of cattle. The country also abounds in an excellent red wine, of a most delicious flavour, and of so good a body, that it will keep for a whole century, improving both in taste and wholesomeness, and gradually turning paler till its redness at length entirely disappears. Great quantities of this wine are exported. In most places the apples and pears are not very good; but the peaches, apricots, figs, and melons of this country are exquisite. Here are likewise plenty of citrons, lemons, almonds, and other delicious fruit.

The soil would also produce all kinds of grain and pulse; but the level spots being interspersed with swampy ground, that has hitherto remained without culture, and the attention of the inhabitants being chiefly engrossed by their trade in wine, it does not yield sufficient corn for so populous a country, and therefore they are obliged to have recourse to importation. In some parts they raise hemp. Bees and silk-worms are here bred in vast numbers. But as to their game, it is much reduced by the avidity of the hunters. The Adda yields plenty of fish, and is famous for its trouts, which are very fat and delicious, and of so large a size as to weigh from fifty to sixty pounds.

There are here numbers of goats, Alpine mice, bears, boars, wolves, lynxes, foxes, martens, hares, and squirrels.

The men are comely, strong, good soldiers, ingenious, and apt to learn all arts and sciences. The women are civil, cunning, and amorous; and here are many people of quality, who are as polite as any in Italy.

The language of the inhabitants is a corrupt kind of Italian. At present Popery is the only religion, though before the year 1620 the Calvinists constituted a considerable body, and had their churches and schools; but in that year the Papists of the Valteline extirpated them by a general massacre, in which no regard was paid either to age, quality, or sex. Their clergy are under the jurisdiction of the bishop of Como.

The principal officers are appointed every two years by the Grisons, and every two years each league sends three persons, with two clerks and a serjeant, to hear the complaints of the people against the officers set over them, to redress their grievances, and decide in case of appeals. A farther appeal in civil affairs also lies to the general diet of the Grisons. The inhabitants are possessed of particular privileges, and have certain laws and statutes granted them by the Grisons, as the sole rule of their conduct, and they choose their council and chancellors out of their own countrymen.

The

The whole Vale is divided into the Upper, Middle, and Lower, called Tergeros. The Upper part consists of eleven communities, the Middle part of eighteen, and the Lower part of only two.

Tirano, the capital of the Upper part, is only six miles from the territory of Venice, and is seated on the river Adda. It is large, populous, and a place of some trade. Formerly it was encompassed by a wall, and defended by a citadel. On the other side of the Adda is a splendid church of white marble, adorned with many embellishments, which are continually increasing, it being much resorted to by pilgrims, who make rich offerings, and having a large income.

The country of Bormio, or of Worms, lies between the country of Tirol, the territories of Venice, and the Valteline, and is on all sides environed by steep mountains, of such a height that their summits are seldom free from snow. A considerable part of the country also consists of these stupendous heights, and the narrow passes are sometimes rendered impassable, by the snow rolling down from the tops of the mountains.

The air is rather cold than warm; but yet pure and healthy. In this country is produced no wine, and but little fruit; it has, however, more corn than is sufficient for home consumption, and the pastures are so rich, that the inhabitants keep vast herds of horned cattle, besides great numbers of sheep and goats. The honey too of this country is particularly good; and it also abounds in iron ore; but its other metals and minerals are inconsiderable.

The Adda, which has its source in these parts, issues from a water that falls down a rock into the Freel, or Frayl valley, in which is a lake, and from other currents that precipitate themselves down the mountains.

The inhabitants, who amount to about fourteen thousand, are Papists, and the whole country is under the diocese of Como.

Though Bormio or Worms is governed by an officer named a podesta, in the name of the Grisons, yet the inhabitants still enjoy all their antient rights and privileges, and all trials here are regulated by the laws of the country; but with right of appeal to the three leagues. Every four months they elect by ballot two officials or chiefs, from their own body, with sixteen counsellors and thirteen justiciaries, who try both civil and criminal causes.

The whole country is divided into five districts, the principal place in which is,

Worms, in Latin Bormium, a town seated on the rivulet of Fradolf, which at a small distance runs into the Adda. This town is the residence of a governor called the podesta, sent hither every two years from the Grisons. It is a pretty and populous place, and had formerly a good castle; but it has suffered much by fires, and that building has been consumed.

The county of Chiavenna takes up the west part of this great valley, and is environed by the Upper league, that of God's House, the Valteline, and the territory of Como; extending, according to Dr. Busching, between seven and eight hours in length, and six in breadth.

It lies among high and steep mountains, and has some vallies of considerable extent. The summer heats are frequently excessive, during which a noxious effluvia are brought from the lake of Como, when the wind is south. However, both the mountains and vallies, the St. Jacob's vale excepted, are well peopled, and the country in most parts not only abounds in pastures, but in all kinds of fruit and wine; but the inhabitants have not a sufficient quantity of corn: they, however, export some wine and cattle, and the culture of silk is an important article. They have here the lavezzi-stone, in Latin lebetes, out of which they turn kitchen utensils, which they send all over Italy.

The principal rivers of this country are the Maira, or Mera, and the Lira, which unite their streams in this country, and then fall into the lake of Como.

The inhabitants are Papists, and in spiritual affairs are subject to the bishop of Como.

This country is divided into two governments, each under a commissary, who is appointed every two years

by the three leagues. These represent the sovereignty, and judge both in civil and criminal cases; but take an oath to be regulated by the particular laws and statutes of the country. Ever since the year 1639, the court of Chiavenna, at every nomination of a new commissary, chooses two lawyers, and the commissary one, who must be natives, as his assessors in penal causes. Civil contests are first referred to a certain number of persons of sense and probity, from whom they may be carried to the college of lawyers; next to the commissary, then to the syndics whom the Grisons send hither every two years; and after all, the discontented party may bring his suit before the three leagues themselves.

The city of Chiavenna, in Latin Clavenna, the capital of the county, is seated on the Maria, in the forty-sixth degree twenty minutes north latitude, and in the ninth degree thirty minutes east longitude, thirty-two miles to the south of Chur, and is a pretty large well built town, in a delightful situation, among fine vineyards. It was formerly walled in, and had two forts on two peaks of a broken rock; but in 1526, both these were demolished by the Grisons. It is the residence of the commissary, and contains a collegiate church, and within and near it are five other churches, with a convent, a nunnery, and a handsome custom-house for the goods which are forwarded on pack-horses to Italy or Germany, according to the consignments of the owners. The inhabitants have dug large caverns in the neighbouring mountains, where they stow their wine, which by this means is kept fresh all the summer, and drinks as cool as if it had been all the time in ice; and near these grottos they have built summer-houses, to which they go in the evening to partake of a collation, and to enjoy the fresh air. The city was formerly much larger than at present; but about five hundred and fifty years ago, all the north part of it was buried in the ruins of a mountain.

It will be proper, before we take leave of the county of Chiavenna, to mention the town of Piuri, which stood in a district of the same name, and was built on the side of the village of Bellfort, which has been destroyed by a flood, and contained one hundred and twenty-five houses, besides some handsome churches, and other public edifices, with a mansion-house for the podesta or commissary, and an arched stone-bridge over the Maira. Towards the south was a hill of a loose texture, that had many currents issuing from it; but in the evening of the fifteenth of August 1618, a prodigious part of this mountain, with a dreadful crash, suddenly fell on the town of Piuri, and also into Chitau, an adjacent village of seventy five houses, and overwhelmed both places so effectually, that not the least trace of them have since appeared. Some represent the number of persons who perished by this calamity as amounting to nine hundred and thirty; others compute them at fifteen hundred, and others maintain that they amounted to upwards of two thousand. The river Maira was for some time obstructed by the rubbish of the mass which thus fell. The people of Chiavenna, though near the town, knew nothing of this dreadful disaster till they saw the river sink, it not receiving a drop of water for three hours. By one of the palaces which was at a small distance from the town, and therefore not overwhelmed with it, a judgment may be formed of the magnificence of the rest. It was a pleasure-house of the family of Francken, which, with its gardens, could not cost less than one hundred thousand crowns, and might be compared with many palaces of Italy.

SECT. XXVI.

The VALAIS.

Its Situation, Extent, Produce, and Fate of the Country. The Manners, Language, and History of the Inhabitants; their Arms and Government: with the principal Places in the Upper and Lower Valais; and among the rest, an Account of the Baths of Leuck, of the City of Sitten, and of the famous Monastery on the Convent of St. Bernard.

THE Valais, in Latin Valleia, the next of the countries stiled the allies or confederates of the Swiss,

is bounded on the north by the canton of Bern and the lake of Geneva; on the west by Savoy; on the south by Piedmont and Milan; and on the east by the Mayenthal, which belongs to the cantons in general, and by the canton of Uri; extending, according to Dr. Büsching, about thirty-three or thirty-four hours in length, and in some parts upwards of ten in breadth.

The whole country is one large vale that extends east and west, and on the north and south sides is bounded by very high mountains. Among the southern mountains, the most remarkable is that called Great St. Bernard's, antiently named Mons Penninus, a name given to the whole Appennine chain. The principal hill on the north side is the Gemmi, which lies towards the frontiers of the canton of Bern, and is impassable in winter, and its descent towards the valley of the Valais was of a dangerous steepness, and very narrow. To remedy this inconvenience, in 1736 several rocks were blown up, the road in most places widened to the breadth of seven feet, and walls raised in the most steep and loosest parts; so that travelling is at present much more safe and commodious than formerly. St. Anthony's hill is also of an astonishing height.

The Valais is a very hot country, remarkable for its fertility. The harvest begins in May, and lasts till the latter end of October; the corn in the bottom of the chief valley being brought in first; next that in the side vallies; and last of all, that on the mountains, which yield grain at an uncommon height. The low lands excel the upper in the produce of winter, and these again the former in summer fruits. Besides the best kinds of grain, as wheat, barley, and rye, this country abounds in good wine, particularly in a fine muscadell, with plenty of apples, pears, plums, cherries, mulberries, chesnuts, and small nuts; and about Sitten, Siders, and Grundis, also grow pomegranates, figs, almonds, and other rich fruits. These parts are also remarkable for producing good saffron. Both the hills and vallies feed great numbers of cattle, and afford plenty of deer, hares, and other game. It is supposed to have also mines of silver, copper, and lead; but the produce, it is said, will not answer the expence of working them. Here is likewise pit coal.

The Valais is from one end to the other watered by the Rhodan or Rhone, to which the country people give the name of Rotten, and which has its source on the Furke mountain. At first it precipitates itself with great noise among several rocks, and down to the very plain in the valley has the appearance of a single cataract, with several cascades. It is afterwards joined by the Meyenwang rivulet, which issues from the Grimsel mountain, and then directing its course due south, enters the Valais, where it runs from east to west, till after winding northward, it discharges itself with great impetuosity into the lake of Geneva; all the streams and lesser rivers of the Valais issuing from the mountains mingle with it.

The Valesians are a brave and courageous people; but it is uncommon to find either a man or woman without a large wen in their necks, which is supposed to be owing to the clayey sandy water, that leaves a sediment in the glands of the body. The apparel and diet of the common people are coarse; but the quality live very splendidly. Most of their houses are of wood, particularly of the larch-tree, which is very durable, and grows as black as ebony. They cover them with slate, and in some places build their houses with turrets and wings.

In the Upper Valais the prevailing language is the German; but the inhabitants of Siders and Sitten, with those in the Lower Valais, speak a corrupt French; tho' in both parts they apply themselves to the German, French, Italian, and Latin, which are indispensibly necessary in their intercourse with the cantons of Bern and Uri, Savoy, Piedmont, and the Milanese; and therefore a stranger cannot fail of being surprised at the fluency with which the meanest people here speak these four languages.

The antient inhabitants of this country were the Lepontii Viberi, with the Seduni and Veragri. In the middle ages it came to be called Valesia, and in 1032, it devolved to the German empire, as a part of the second

Burgundian kingdom; but three years after the emperor Conrad II. made over the Lower Valais to the counts of Savoy. The inhabitants, on several occasions, have resolutely maintained their liberties. In 1475, the bishop of Geneva fell on the Upper Valais with a body of eighteen thousand men, consisting of Lower Valesians and Savoyards; but the Upper Valesians being assisted by three thousand troops sent by Bern, Freyburg, and Solothurn, their allies, defeated the bishop, and even made a conquest of the Lower Valais, which has ever since been subject to them. In the same year they formed a perpetual alliance with Bern, which has been renewed with the whole Helvetic body; and in 1533, they entered into a particular union with the seven Popish cantons.

The arms of the republic of the Valais are, party per pale gules and argent, three mullets in each field, with one on the pale.

The republic of the Upper Valais consists of seven parts, called Zenten or Tythings. In six of these the government is democratical; but that of the seventh, which consists of the city of Sitten, is aristocratical. Each Tything sends a representative to the general diet, which assembles twice a year, that is in May and December, at Sitten. This diet has the management of the public concerns, both civil and military, besides appeals in processes brought before the Tythings: it likewise gives audience to envoys, &c. Over each Tything is a chief, called a meyer, or mayor, with a particular regency and jurisdiction; but the Tything court is composed of the Tything judge, assisted by twelve assessors and judges, who act both in civil and criminal cases. The military affairs of each Tything are under the direction of a banneret and captain.

The principal places in the Upper Valais are the following:

Brug or Brieg, a large open town, and the capital of a Tything of the same name, is seated on the river Saltana, at the foot of the mountain of Brug, in the pass of Simplon. Here are several fine buildings, particularly a handsome Jesuits college and nunnery of Ursulines, and here also are held the Tything courts. In the year 1755, the greatest part of the town was destroyed by an earthquake.

Leuck is a village seated on an eminence near the conflux of the Dala and the Rhone, and has two churches, a fine town-house, and an old castle, which belongs to the bishop of Sitten. As it stands near the center of the Valais, the deputies of the country often assemble here.

The famous hot baths, called the Baths of Leuck, are in a valley about two leagues distance, inclosed on all sides by high mountains, through which there is only a narrow passage to a wood on the south side. They are formed by five springs, not far from each other. The largest, which fills eight baths, flows plentifully, and the water is hot enough for boiling eggs. It is for the most part clear; but sometimes changes its colour. It is purgative, and good against colds, the gout, weak stomachs, diseases of the liver, lungs, and spleen, dimness of sight, convulsions, defluxions, the dropsy, stone, ulcers, distempers of the womb, &c. There is another of the springs good against the leprosy, and at a small distance from these are several cold springs, the largest of which flows only from May to September, that is, during the summer, when other springs are dried up; but this is ascribed to the melting of the snow on the Alps.

Sitten, or Sion in French, and in Latin Sedunem, the capital of all the whole Valais, is seated on the river Sitten, at a small distance from the Rhone, in the forty-sixth degree seven minutes north latitude, and in the seventh degree forty minutes east longitude. It stands almost in the center between the Upper and Lower Valais, in a delightful plain, overlooked by pretty high hills on the east side, on the highest of which is a fort, in which the bishop resides in very hot weather, or in sickly seasons. Here is also another fort, called the Valeria, which has a church, and several fine houses. The city is neat and well built, with four churches: the most remarkable of these is the cathedral, which has at the great gate a fragment of Roman marble, with an inscription to the honour of the emperor Augustus.

The

The subjects of this republic consist of the inhabitants of the Lower Valais, which contains several districts.

In this country is the mountain of St. Bernard, which has on its summit a large convent, where the friars maintain all travellers for three days gratis, whether Papists or Protestants; but people of fashion and gratitude make some civil acknowledgement on their leaving this house of hospitality. If any one dies here, they do not inter him, but carry him to a chapel at some distance in the midst of snow, where the dead body lies without corruption from the extreme coldness of the place. A thousand travellers would be in danger of perishing on this rugged mountain, were it not for these honest friars, who send out people with brandy and other cordials to comfort them, especially in the winter, and upon great thaws, when they sometimes find the poor travellers stretched on the ground, and almost starved to death by the violence of the cold, or ready to drop down with fatigue from the difficulty of the road. This renders these friars so well beloved all over Switzerland, that when they send thither for a collection, which they do once a year, there is scarce a family, rich or poor, Protestant or Papist, but gives freely to the relief of the convent, which though it is said to be large enough to hold six hundred people, and to be so shut up in snow and ice that nothing grows near it, yet such care is taken, that this house wants for nothing.

St. Maurice is a large handsome town, seated between two hills on the Rhine, over which it has a stately stone bridge, reaching from one hill to the other. On the west side of the bridge, close to a high mountain, stands the governor's seat; on the eastern side is a tower, and below both a gate, which is shut by night. This pass is a great thoroughfare for all goods and persons going from the lake of Geneva through the country of the Valais, and over the mountains of St. Bernard. In this town is an Augustine canonry, the abbot of which is vested with the lower jurisdiction in several villages; and the abbey contains many pieces of antiquity, particularly a great number of Roman inscriptions, and near the high altar is a curious Mosaic pavement.

S E C T. XXVII.

The Principality of NEUFCHATEL.

Its Situation, Extent, and Produce, the Language, Religion, History, and Government of the Country; with a Description of the City of Neufchatel, and an Antiquity on the top of a Mountain.

THE next of the allies of Switzerland which we shall now mention, is the principality of Neufchatel, bounded on the north by Basil; by the lake of the same name on the east; the county of Bern on the south; and by the Franche Comté on the west; it being about forty miles long, and twenty broad.

It is every way hilly, and along its northern and western borders runs the Jura chain. The mountainous part produces very little, except herbage for cattle; but the inhabitants, who are chiefly artificers, procure themselves a comfortable subsistence by their labour. However, the smallest eminences, with the valleys and plains, not only produce red and white wines, but fruit, corn, hemp, and flax.

The Neuenburg lake, so called from the town of Neuenburg, which stands on its bank, is nine hours in length, and two in breadth; but not of any considerable depth. It affords plenty of fish, particularly pike and trout: on the side of the town it receives the river Orbe, and into its western part run the two small rivers of Areuse, or Reuse, and Seyon. Its north side forms an outlet to the Zill, by which means it has a communication with the lake of Biel.

In the whole principality are three towns, one borough, and twenty-five parishes, with ten chapels of ease, sixty-four villages, and a great number of scattered houses. The current language is French; but with a mixture of the Burgundian, both in the accent and dialect.

The greatest part of the inhabitants are Calvinists, but in the castellany of Landeron Popery is the prevailing religion. The twenty-three head parishes, and nine of the filials, are Protestants, and divided into the three colloques of Neuenburg, Boudry, and the Val de Travers. All their several ministers meet annually at Neuenburg chapel, in the month of May; and this assembly being vested with the superintendency of all ecclesiastical affairs, confirms the church officers who are newly chosen, and collates and ejects ministers, except in the town of Neufchatel. In the castellany of Landeron are two Popish parishes, and one chapel of ease, which in ecclesiastical affairs are under the jurisdiction of Lausanne.

This country anciently belonged to the last kingdom of Burgundy, with which, in 1032, it devolved to the German empire. Since that time it has been possessed by many different families, and in 1707 the high tribunal of the state of Neufchatel, after a mature and impartial examination of the claims of several illustrious families, passed a decree in favour of Frederick I. king of Prussia, who immediately took possession of it, and the usual homage was performed to him, he on his part confirming all the liberties and privileges of the state, and its alliances with the neighbouring powers. At the peace of Utrecht, concluded between France and Prussia in 1713, the French king acknowledged the king of Prussia as sovereign-lord of Neufchatel and Vallangin; and the inhabitants are in all parts of France intitled to the same rights and privileges that are indulged to the natives of the Swiss cantons, or which they enjoyed before the king of Prussia became their sovereign.

On the other hand, by virtue of the community of rights which the lords of Neufchatel have entered into with the cantons of Bern, Lucern, Freyburg, and Solothurn, both the sovereign and the town are reckoned associates of the cantons.

The king, as head of the state, presides in its assemblies, convokes them at pleasure, collects their suffrages, and, when equal, decides the point in deliberation. He has also the management of all military affairs, with respect to which he is stiled lieutenant-general, and with him is connected the council of state. The number of the members depends also on the sovereign's pleasure. This council superintends all the affairs of the state and police, and decides in any occurrences or contests. The governor here sits as president, and in case of his absence the senior counsellor. He likewise summons them together, whenever he pleases, though their usual time of meeting is every Monday and Tuesday in the morning. Under him are many general and particular officers nominated by the sovereign, as the treasurer, to whom the receivers pay the several branches of the revenue; the first secretary to the council of state; the general procurator, who attends to the maintenance of the sovereign's rights; the general commissary; the general advocate, who carries on the processes of the sovereign; the castellans, and the mayers or mayors, who are placed over the lower courts, with a stadtholder or lieutenant under them.

The principal court of justice, which judges without appeal, is that of the three states of the sovereignty of Neufchatel. The first of these states is composed of four nobles, who are generally the four eldest noblemen in the council of state. The second is called the state of officers, and consists of the four castellans of Landeron, Boudry, the Val de Travers, and Thielle, and any deficiency in these is supplied by the mayers or mayors. The third state is composed of four burghers of Neufchatel, annually elected by the town council from among their own members. In this assembly the governor presides, and on an equality of votes has the casting voice: the general procurator takes care that nothing be transacted contrary to the prerogative of the sovereign. This assembly finally determines all suits brought before them from the lower courts in the sovereignty of Neufchatel, explains the acts of the council of state, and gives their assent to any new edicts of the sovereign, or to the repeal or alteration of the old ones.

Among the superior courts, is that for the trial of criminals, in which the decrees are executed without appeal, unless the sovereign, or his governor, are disposed

to favour the convict, either by mitigating, or annulling the sentence; but to aggravate it is not in the power of either. Those courts for the punishment of criminals are of two kinds, some invested with the high jurisdiction, and others confined to the lower; and their sentences extend no farther than imprisonment, the pillory, whipping, &c. Of this last kind are all the country courts.

Their militia, exclusive of that of the precinct of the city of Neufchatel, amounts to upwards of eight thousand men, who are ranged into several companies; and the whole military establishment is under the direction of a general inspector, four lieutenant-colonels, and the like number of majors.

Neufchatel, called by the Germans Welsch-Neuenburg, and in Latin Neoconum, or Novicastrum, the capital of the country, is seated on two eminences adjoining to the lake of the same name, which here receives into it the little river Seyon. It is a fine town, consisting of four large streets, and an old castle, in which the governor resides, to which there is an ascent by one hundred steps, some of them cut out of the rock. The houses are generally well built, and among them are several handsome structures and good fountains. Near the castle is a fine old church, and a terrace that affords a view both of the town and lake. In the plain at the bottom is another church, the town house, and likewise a gymnasium. Here are several monuments of antiquity, particularly a stately tower on the descent of one of the hills, said to have been built by Julius Cæsar. Round the town are on all sides vineyards, gardens, and country villas. The city is governed by a council of sixty burghers, who enjoy such privileges that they are almost independent. Neufchatel has several times suffered greatly by fire, and in 1750 endured as much from two inundations of the Seyon.

It ought not to be omitted that on one of the summits of the Jura chain, near a scattered village called la Cote aux Fees, is a very superb temple hewn out of the rock, in which Mercury was anciently consulted by means of certain prophetesses. It is with great difficulty that a person can descend to the entrance, before which is a stately portal, where an almost inaccessible rock forms an arcade of a stupendous magnitude.

SECT. XXVIII.

The Republic of GENEVA.

Its Situation and Produce. With a particular Description of the Lake of Geneva, and of the City of that Name.

THE republic of Geneva, by the Germans called Genff, and by the French Genève, is the last of the allies of Switzerland. This republic is but of small extent, for, exclusive of the city of Geneva, it does not contain above eleven parishes, eight of which are partly under the jurisdiction of the duke of Savoy; yet it is a considerable ally of the Swiss cantons. The country in general is very fruitful and populous: its villages are large, well built, and adorned with many fine houses belonging to the citizens of Geneva. It abounds with fruit, and produces white and red wine; the former indeed is small, but the latter excellent. The only corn sowed here is wheat, which its soil bears here in great plenty; and the republic constantly keeps a large magazine of it against a time of scarcity, when they sell it out at a reasonable rate; and in a time of plenty, they also oblige the bakers, and those who keep public houses, to buy it of them, but at a moderate price.

The lake of Geneva resembles the sea, both in the colour of its water, the storms that are raised on it, and in the ravages it makes on its banks, and is as little subject to frost as the lake of Constance. It receives different names from the coasts it washes, and has in summer something like the ebbing and flowing of the tide, occasioned by the melting of the snows, that fall more copiously into it at noon, than at other times of the day. It has five different states bordering on it; these are France, the dutchy of Savoy, the canton of Bern, the bishopric of Sitten, and the republic of Geneva. This lake is in

shape like a half moon, whose convex side looks towards Switzerland; so that it is sixteen leagues in length on this side; while towards Savoy, it does not exceed twelve. It is pretty narrow at both ends; but widens by degrees to the middle, where it is twenty-five miles over. As to its depth, it is said in some places to be unfathomable; and is therefore navigable by larger vessels than are commonly seen in rivers. Near Villeneuve, the Rhone discharges itself into it with such rapidity, that for the distance of half a league its water, which is very foul, continues unmixed with that of the lake, which is very clear; but afterwards, says Mr. Keyser, there is no visible distinction, though some of the ancient, and several of the modern writers affirm the contrary. Formerly this lake afforded trouts of fifty or sixty pounds weight; but now one of twenty or thirty is reckoned very large.

The Rhone, at its influx, forms an island, on which, together with the banks on both sides, stands the city of Geneva, which is thus divided into three unequal parts, that have a communication by four bridges, and is situated in the forty-sixth degree twelve minutes north latitude, and in the sixth degree nineteen minutes east longitude. The greatest part of the city is seated on a hill, and has its view bounded on all sides by several ranges of mountains; but these are at so great a distance, that they leave open a surprising variety of beautiful prospects, and from their situation, cover the country they inclose from all winds except the south and north, and to the last of these winds the inhabitants of this city ascribe the healthfulness of the air; for as the Alps surround the city on all sides, forming a vast basin, within which is a well watered country, there would here be a constant stagnation of vapours, did not the north wind put them in motion, and scatter them from time to time. From this situation Mr. Addison observes, the sun rises later at Geneva, and sets sooner, than in other places of the same latitude; and the tops of the neighbouring mountains are covered with light above half an hour after the sun is down at Geneva. These mountains also much increase the heats of summer, and form an horizon that has something in it very singular and agreeable. On the one hand a long range of hills, distinguished by the name of mount Jura, is covered with pasture and vineyards; and on the other huge precipices, formed of naked rocks, rise in a thousand odd figures, and being cleft in some places, discover high mountains of snow, at the distance of several leagues behind them. To the southward, the hills rising more insensibly, leave the eye a vast uninterrupted prospect; but the most beautiful view is that of the lake, and its borders, that lie north of the town.

The part on the right side of the Rhone, which from a church of that name is called St. Gervais, is very much inferior both in its dimensions and beauty to the buildings on the eminence on the left side of that river; but for these thirty years past, daily improvements have been made in every part of the city. The large and beautiful fortifications have drawn hither several sorts of workmen, and occasioned many judicious measures for procuring materials for building at a reasonable rate; so that what might at first appear to raise the price of private building, has had a very contrary effect. New-street consists of fine buildings, particularly the house facing the Treille, or walks made behind the town-house. These walks consist of lime-trees, and being on an eminence, afford a beautiful prospect of the large gardens beneath them, and of the fields and meadows towards the mountains. One of the most magnificent houses is that of Mr. Lullin, an ecclesiastic, which is said to have cost him above eighty thousand dollars. Some streets of the Lower Town have a kind of piazzas; but they are loftier than those of Bern, and project farther. Shelters of this kind are very convenient in a city without coaches.

Among the public buildings we ought not to omit St. Peter's church, which was formerly a cathedral, and is a spacious antient structure, in the form of a cross. In the front is the figure of the sun, which was worshipped in the time of the Pagans, and which the city several ages after took for its device, with this motto,

POST

POST TENEBRAS SPERO LUCEM; but after the inhabitants had embraced the Reformation, the motto was changed for POST TENEBRAS LUX; the former denoting that after darkness, it hoped for light, and the other, that light was come. In the nave of the church behind the pulpit are the statues of the twelve apostles carved in wood, as on the other side are the twelve prophets.

It is remarkable, that in the churches the kings of England and France are nominally prayed for. The Christian behaviour and peaceable temper of the clergy here, may serve for a pattern to their brethren differing from them in some doctrinal points. Both the clergy and laity are averse to any discourse on the proceedings against Servetus, and wish that the whole matter was buried in oblivion.

On the Plainpalais without the city, is the general burial-place, and in this church-yard the body of Calvin lies interred; but the inhabitants of Geneva, to shew their aversion to sectarism, will not tell or seem to know in what place it is deposited; but it is said, that a Lutheran ecclesiastic was buried close by Calvin.

Adjoining to the cathedral of St. Peter is the chapel of the Maccabees, where both the Germans and Italians perform divine worship, and where also the professors of philosophy read their lectures. Besides the two churches and this chapel, already mentioned, there are four other churches. The general hospital is a new building that has a particular chaplain of its own. The French have likewise an hospital for the relief of their brethren. The town-house is a stately edifice of free-stone, situated on an eminence not far from the cathedral, and in it is a spiral passage paved with square stones, where a person may walk or ride under cover from the bottom to the top; and at a small distance from it is the arsenal, in which are shewn the ladders, a charged petard, and other implements made use of by the Savoyards in their famous design of surprising the city by night in 1602, when they were repulsed and beaten off with all the ignominy their perfidiousness deserved. The university, which is reckoned among the most celebrated in Europe, was founded in 1558, and has twelve professors belonging to it, with a very valuable library, in which are some curious manuscripts. At the efflux of the Rhine out of the lake is a building in which are kept the public barges, yachts, and vessels built for their defence.

Without the gates are handsome seats, delightful gardens, and pleasant walks. The salubrity of the air, with the excellent provisions, the agreeable situation of the place, the politeness of the inhabitants, the great number of manufacturers and artificers, as also of persons passing through it from Germany or France to Italy, or from Italy to France, as likewise of young foreign gentlemen residing here to perfect themselves in the French tongue, polite literature, and other academical exercises, contribute to render this city extremely delightful.

Great quantities of beautiful manufactures and fabrics are made here; and among many works of ingenuity that of watch-making is carried on with great success. Its trade is, however, somewhat declined; but is still very considerable, on account of its being a thoroughfare for goods passing from France to Germany and Italy, as also from Germany to France, they being easily shipped from hence on the Rhine or the Rhone.

The revenues of the city, besides that arising from the sale of the corn, which is inconsiderable, annually amount to about a hundred and thirty thousand dollars, the greatest part of which are employed in the salaries of the civil and ecclesiastical officers, in the building and repairs of the public edifices, and in the payment of the garrison, which consists of eight hundred men well disciplined, who wear an uniform of blue faced with red.

The power has been immemorially lodged in the people, who consist of about fifteen hundred burghers; their chiefs being four syndics, who, with twenty one councilmen, constitute the supreme court of twenty-five, of which two persons of one family cannot be members at the same time.

The next is the more severe court, consisting of sixty, and the great council of two hundred. The syndics are chosen by the people out of the council of twenty-one; and they continue in office but a year: however, they retain their seat in the council, and are capable of being chosen again. For the support of credit it is enacted by an express law, that no son who does not discharge his father's debts shall be capable of any office.

This little republic has some peculiar ordinances relating to matrimony. No marriage is permitted unless both parties be Protestants; all previous promises or engagements of a Reformed with a Roman catholic, are declared void, and the agents, with those who have given their assent to it, are punishable according to the nature of the circumstances. A woman of forty years of age cannot marry a man that is ten years younger than herself; if above forty, her choice is confined to five years younger. A man about sixty is not to marry a woman who is not at least above half that age; and a widow must remain such six months before she can alter her condition. In this particular a man is not expressly limited; but is, however, enjoined to wait a reasonable time, with this singular addition, "both to obviate scandal, and to shew that he has felt the hand of God."

The maintenance of a good police, and the suppression of luxury, is the province of a particular chamber; but a very extraordinary fund here, is that arising from the dirt of the streets. In other places money is paid for having it carried away, whereas here it is farmed for eight hundred livres paid to the city, for the exclusive privilege of taking it away for manuring land.

C H A P. XXIII.

Of I T A L Y.

S E C T. I.

Of ITALY in general.

Its Names, Situation, Figure, Extent, Mountains, Rivers, and Produce. The Arts, Language, Religion, Customs, Manners, and Food of the Inhabitants, with the Divisions of the Country.

ITALY was antiently known by the names of Saturnia, Oenotria, Ausonia, and Hesperia. The first was derived from Saturn, the second and third from its primitive inhabitants, and the fourth, which signifies a western country, from the Greeks; because lying to the west of them. In succeeding times it obtained the name of Italia, according to some authors from Italus, a king, of Sicily; but in the opinion of others from the Greek word *Ιταλος*, which signifies an ox, this country, from the richness of its pastures, being remarkable for the abundance of its fine oxen. Each of these appellations, at first peculiar to distinct territories, were afterwards given to the whole country.

Italy, including Sicily, lies between the thirty-seventh and forty-sixth degree of north latitude, and between the seventh and nineteenth degree of east longitude. Nature has fixed its boundaries; for towards the east, south, and west, it is washed by the Adriatic and Mediterranean seas, and to the north by the high and lofty mountains of the Alps. Its figure is generally compared to that of a boot, and is therefore divided into three parts; the top of the boot containing antient Lombardy; in the upper part of the leg are the territories of the church and of Tuscany; and in the small of the leg and foot is the kingdom of Naples. The length from Aosta, at the foot of the Alps, to the promontory called Capo del Armi, in Lower Calabria, is computed at near eight hundred Italian miles, which make about seven hundred and twenty-six English statute miles. Its breadth at the foot of the Alps is five hundred and sixty Italian miles; and through the middle, that is, between Ancona and the mouth of the Tiber, one hundred and thirty-six; but in some places hardly twenty-five.

The principal mountains in Italy are the Alps and the Apennines. The Alps, of which we have given some account in treating of Swisserland, are a long chain of mountains, that begin at the mouth of the river Var, and, after many irregular windings, terminate near the river Arsa in Istria. They divide Italy from France, Swisserland, and Germany, and are variously denominated according to their situation. The Alps on the sea-coast reach from Vada or Vado, to the source of the Var, or even to that of the Po; the Cottian Alps, from the source of the Var to the city of Susa; the Greek Alps, from the city of Susa to mount St. Bernard; the Peninian Alps, from mount St. Bernard to mount St. Gotthard; on these border the Rhætian Alps, which extend to the source of the river Piava; and lastly, to mention no more, the Noric, or Carnician Alps, which extend from the river Piava to Istria, and the source of the Sauffrom. We have already given an account of some surprising particulars relating to these stupendous mountains, and shall give others no less extraordinary in treating of Savoy and Piedmont.

The Apennine mountains take their rise near the Alps, on the sea-coast, in the territories of Genoa, and dividing Italy into almost two equal parts, reach to the streights that separate Italy from Sicily, and give rise to an incredible variety of rivers that water this delightful country. The largest and most remarkable of the rivers of Italy are the following:

The Po, which rises in mount Veso, one of the highest of all the Alps, and after receiving upwards of thirty

small rivers, discharges itself into the Adriatic by seven different mouths. The Adige, in Latin *Athesis*, has its source in the Rhætian Alps, and waters the cities of Trent and Verona, it being the only large river in Lombardy, and instead of joining the Po, runs like that river into the Adriatic. The Arno flows from the Apennine mountains, and falls into the Tuscan sea near Pisa. The Tiber rises also out of the Apennine mountains, and at a small distance from Rome; empties itself into the Tuscan sea. Besides these there are many others.

This country produces in great plenty all the necessities and conveniences of life; for all the variety of delicacies that lie scattered, as it were, in other countries, are here almost every where met with in profusion. These consist in corn, rich wines, and the choicest fruits; as oranges, citrons, lemons, olives, pomegranates, &c. raisins, almonds, sugar, oils, mulberry-trees, beyond number, to facilitate the producing of silk; tame and wild beasts, alabaster, jasper, gold, silver, sulphur, iron, alum, &c. On this account authors have been extremely lavish in their praises of this fine country, which they have stiled the parent of plenty; the source of earthly felicity; the pride of our earth; the garden of Europe; and the beauty of the world. But it must be acknowledged that the fine plants, which, from time to time, have been introduced into the western and northern countries from Italy, as the reputed mother of them, are not all original natives, the far greater part being transplanted to the Italian soil from the east. Thus all the fruit-trees, the produce of which the Latins called *mala*, were transplanted to Italy after the conquest of the Romans in Africa, Greece, Asia Minor, and Syria. The apricots came from Epirus, and are called *mala Epirotica*; the peaches are named *mala Persica*, from their being brought from Persia; the citrons *mala Medica*, from their being transplanted from Media; the pomegranates *mala Punica*, from Carthage; and chesnuts were transplanted from the town of Castania, in the district of Magnesia, in Macedonia. The best pears were sent from Alexandria, Numidia, Greece, and Numantia, as their Latin names sufficiently indicate. The first plums were imported from Armenia and Syria, especially from Damascus. Lucius Lucullus was the first who introduced cherry-trees from Pontus, which soon after became the growth of all other countries in Europe.

But however rich and fertile Italy in general may be deemed, yet no small difference is discoverable with respect to the fruitfulness of the soil, the salubrity of the air, and the pleasantness of its provinces. It is subject to several great inconveniences, particularly in the middle and lower parts, and in most countries the number of inhabitants is far from being sufficient for the improvement and culture of this fruitful soil. On considering the multitude of people in Italy, during the reigns of the Roman emperors, its present desolateness, which is most perceptible in the papal dominions, cannot but appear surprising. The ingenious Mr. Addison was of opinion, that the Campania of ancient Rome contained more people than are at present throughout all Italy, and that there is not a town of any consequence in the whole country where the ecclesiastics do not make at least one-third of the inhabitants.

The ancient inhabitants of Italy were the triumphant conquerors and rulers of the world. The softer arts have now taken place, and seem the chief employment of the modern Italians. Painting was indeed introduced at Rome by Caius Fabius, and was brought to considerable perfection before the time of Augustus; but a corrupt taste soon after prevailing, the politer arts were obliterated, and by degrees sunk into oblivion. Since the decay of the Roman empire, Painting paid Italy a second visit,

visit, and the masters that excelled in it for a long time preserved an unrivalled reputation. Whether the first Greek painters came to Bologna, Florence, or any other city, has been warmly disputed. In the thirteenth century, most of the church painting was either in Mosaic or fresco. The first painters who distinguished themselves, were generally also statuarys and architects, and their works are still the admiration of the curious. The invention of engraving is claimed by the Italians; but that honour is only justly due to the Germans; for Andrew Mantegna, who died in 1517, in the 69th year of his age, was the first who applied himself with success to this art in Italy. The Italians still maintain their superior character for skill in statuary. Some causes of the advancement of this science among them, is their having the noblest models, which they keep before them; the many lectures and conferences in the academies; the liberal payments; the constant opportunity of displaying their skill; the incentives of praise; and the gaining of prizes. Almost every city has an academy of sculpture and painting, and some places more particularly distinguish themselves by excelling in particular branches of sculpture. The Italians have also distinguished themselves in architecture.

Italy has produced great men in all sciences, and formerly gave birth to those generals, orators, poets, and historians, whose actions and writings will be revered as long as manly fortitude, polite learning, and elegant composition, are considered as ornaments of human nature. Yet its state of literature cannot now be deemed considerable, though encouraged not only by several universities, but by a multiplicity of academies or literary societies, which are to be found almost in every city. Some of these affect very odd and whimsical names, as the *Otiosi*, *Humoristi*, *Lincei*, *Fantastici*, *Immobili*, *Imperfecti*, *Inquieti*, *Incogniti*, *Discordanti*, *Occulti*, *Ardenti*, *Catenati*, &c. and indeed most of their productions are tinged with the singularity of these appellations.

The Italian language is originally derived from the Latin, with which the many nations of Goths, Huns, Vandals, &c. that over-run Italy, so mingled their dialect as to give birth to a new language, at first very lavish; but gradually polished, and softened into its present agreeable smoothness. Its genius seems particularly adapted to poetry and music; for which the Italians are also famous: and hence the Italian singers are more in request than those of any other nation.

The Popish is the only religion generally tolerated in Italy, and here the pope has his seat in quality of head of the church of Rome. The Jews indeed enjoy a kind of toleration; but it is in most places under great restrictions. However, they enjoy an entire liberty in the city of Leghorn.

The Italians are polite, affable, and ingenious; they endeavour to recommend themselves by their wisdom and gravity; observing a just medium between the stately gravity of the Spaniards, and the airy levity of the French. They are said to act a buffoon, a mimic, or a scaramouch, better than any other nation; and to be as apish and whimsical during the carnival, when under a mask, as any other people; but are too wise to do it with a bare face. They have a warm sense of gratitude, and upon all occasions are ready and willing to return an obligation, though ever so small; but, on the other hand, are jealous and revengeful; very retentive of the sense of an injury, especially where their own honour, or that of a wife, sister, or mistress, is concerned, and in these cases scruple not to proceed to treachery and murder: but as they are very courteous to strangers, especially after they have begun an acquaintance or friendship with them they are very cautious of disobliging or quarrelling with them. They are extremely nice in all the punctilios of civility, and no people are more profuse of strained compliments, and pompous titles. Whispering in company, speaking in another language, and interrupting a man before he has done speaking, are esteemed the height of ill breeding, and are scrupulously avoided by all polite people; and reflecting upon persons, either absent or present, is no less detested.

The nobility and gentry lavish their money on fine houses, paintings, statues, beautiful gardens, grottos,

fountains, and cascades, more than in keeping a splendid table, and indulging in the luxuries common in other parts of Europe; and though the great are fond of rich equipages, coaches, and a large retinue of servants, they do not suffer the latter to interfere with the oeconomy of their table; but commonly keep their servants at board-wages.

They commonly sleep about two hours after dinner, which is but a slight meal in comparison with their suppers. These last they begin with roast meats, and end with soups, and the like. Boiled snails, served up with oil and pepper, or fried in oil, and the hinder part of frogs, are esteemed delicacies; and several sorts of fowl are eaten here by the great, which the poorest amongst us would hardly touch, as kites, hawks, jackdaws, and magpies. They both eat and drink very sparingly, and have their wine cooled by ice or snow.

The inns in the little towns, says Mr. Misson, are ill furnished with provisions, especially on some roads. The first course, called the *antipasto*, is a dish of giblets boiled with salt and pepper, and mixed with whites of eggs; after which come two or three small dishes, one after another, of different ragouts. Between Rome and Naples, the traveller is sometimes regaled with the flesh of buffaloes and crows; but that of the buffaloes is black and hard, and that beast must be hunted, otherwise it is impossible to chew its flesh. In all our travels through Italy, says the above author, we never saw either a hare or a partridge in the fields: and I might also add, that we saw none in the inns, which is the more extraordinary; as there are large spots of ground in Italy that are almost uninhabited, and consequently might be expected to abound with game, like other places of the same kind, in other parts of the world: besides, the lords of these grounds seldom reside upon them, and yet are as jealous of their rights as those of other countries. Quails, however, are not such rarities; for on the approach of spring, they come in such flocks from Africa, as to cover the whole country; at which time they are so tired with their long passage, that they throw themselves into the ships, and wherever they can find a place to repose themselves, and may be caught in heaps without the least struggling; but as they are extremely lean, those who take them usually feed them some time before they eat them.

Among the various sorts of wine in this country, is one called *Lacryma Christi*, or the tears of Christ. About Loretto their wine casks are made short and broad, like a dutch cheese; but towards Pavia, their length is about seven times their diameter.

Towards Parma and Placentia, where there are excellent pastures, they make cheese of all their milk. As butter is scarce in Italy, they use oil in all their ragouts and fricasees; but though they draw it from their own olive-trees, it is frequently worse than in those countries where none of those trees grow; for what will yield a price, and keep longest, is always exported for the sake of gain.

It is remarkable that the Italians begin the day immediately after sun-set, and their clocks always strike twenty-four hours from one sun-setting to another. According to this manner of computation, the hour of noon varies daily; for when the sun sets at four o'clock according to our calculation, they reckon one when we count five, and consequently it is noon at twenty hours; and in like manner, when the sun sets at eight on our dials, it is one o'clock with them when we reckon nine, and just noon at sixteen hours; and yet with respect to the artificial day between sun-rising and sun-setting, they, like us, use the words yesterday and to-morrow.

The Italian manufactures and trade are in a flourishing condition. Italy has a great variety of excellent wines, fruits, and commodities, which it exports, and its silks alone make a very considerable article. The most famous annual fairs in Lombardy are held at Alessandria, Cremona, Bergamo, Brescia, Verona, Reggio, and Placentia.

Each state has its own coin both great and small, the knowledge of which, though requiring a particular application, may be gathered from the following account, which contains only what is necessary.

In SAVOY and PIEDMONT.

Twenty foldi make one lira, or pound, which is equal to one shilling English. The louis d'ors and Spanish pistoles are worth sixteen liras; the Savoyard pistoles, fifteen liras three-fourths. Other Italian pistoles, fifteen and a half. The Italian silver crown is valued at five liras and five foldi; a ducat or ongaro at eight liras thirteen foldi; a Milanese filippo at four liras thirteen and a half foldi.

In the MILANESE.

Three Milanese liras are equal to two Piedmontese. One filippo is worth seven liras and ten foldi, about five shillings sterling, two shillings being equal to three liras. A Spanish pistole, twenty-four liras and between three and four foldi. An Italian pistole, twenty-four liras. A ducat in gold is worth thirteen liras sixteen foldi. A ducatoon of Milan, Venice, and Florence, or a silver crown, is equal to eight liras: and a zechine in gold is worth fourteen liras ten foldi.

At VENICE.

Two foldi make one cassetti, ten cassetti one lira, equal to about six-pence two-fifths sterling. One ducato corrente is worth six liras and a half, sixty-two cassetti, or one hundred and twenty-four foldi. A ducato di banco, or four shillings and four-pence sterling, is an imaginary coin, and worth five liras one-sixth. A doppia, or a Venetian, Spanish, Genoese, Florentine, and French pistole, is equal to twenty-nine liras current, or thirty-six of the base liras. A zecchino is eighteen liras and a quarter. A ducat of gold, or ongaro, is equal to sixteen liras. A large silver crown, eleven liras current, in common currency thirteen base liras eighteen foldi. A justinian and filippo, eight liras ten foldi; but common currency, ten liras two foldi.

At GENOA.

Twelve denari make one foldi, and twenty foldi are equal to one lira; which is about eight-pence three-fifths sterling. A piece of eight goes here for five liras. A scudo d'oro, or half doppia di Spagna, is nine liras eight foldi. A scudi d'argento is worth seven liras twelve foldi. A scudo di Cambio, four liras. A filippo di Milano, five liras eight foldi. A scudo d'argento, ninety foldi moneta carta, in which coin the customs are paid. A doppia d'España, French weight, is nineteen liras two foldi current. A doppia di Genoua, eighteen liras sixteen foldi. A doppia d'Italia, full weight, is eighteen liras eighteen foldi.

At FLORENCE.

Twelve denari make a soldo; twenty foldi a scudo. A scudo d'oro is an imaginary coin, which is reckoned at seven and a half liras, or one hundred and fifty foldi. A testoon is worth two liras, or three giuli. A Spanish pistole is valued at twenty liras and about four foldi, or between thirty and thirty-one giuli. An Italian pistole, twenty liras, or thirty giuli. A ducat, or silver crown, seven liras, or ten giuli and a half. A piece of eight, six liras; but in paying of custom one hundred and fifteen foldi, or five liras three-fourths.

At LEGHORN.

One gratia is equal to one soldo and one-third or five quatrini. One giuli di Roma is eight gratie. One testoon is two liras, or three giuli. One lira, which is an imaginary coin, is one giuli and a half, twenty foldi, or two hundred and forty denari; and one soldo, twelve denari. One pezzo is twenty foldi; one pezzo d'ollo reali, or piece of eight, is six liras nine giuli, or a hundred and twenty foldi, about four shillings sterling. Seven liras make one ducat, which is the piastra or scudo of Florence. One Spanish pistole is valued at twenty liras, and between four and five foldi or thirty-two giuli. One Italian pistole is twenty liras, or thirty giuli.

At BOLOGNA.

Twelve denari make six quadrini, which are equal to one soldo; twenty foldi, or bajochi, or Bolognini, make one lira, and two giuli are equivalent to one lira. A scudo, or pezzo d'otto, is four liras five foldi, or eighty-five Bolognini, about four shillings and three-pence English. One Spanish pistole is sixteen liras, and between ten and twelve foldi. One zechino is nineteen giuli. One ducat, or ongaro, is eighteen giuli, or nine liras ten foldi, or about five shillings and three-pence English; a ducatoon, or silver crown, ten giuli and a half.

At ROME.

One bajocho, a copper coin, is equal to five quatrini. Ten bajochi are worth one giulo, as also one paolo. Seven gazetta, and one quatrini, are likewise equivalent to one paolo; and one gazetta is seven quatrini. Ten giuli make one scudo monita, or current, which is about four shillings and four-pence sterling. A Spanish pistole is thirty-two giuli, or paoli, more or less. One Italian pistole is thirty-one giuli, or paoli.

At NAPLES.

Three quatrini make one grana; ten grana, one carlini; two carlini, one taro; five tari, one ducato; forty-five carlini, one Spanish pistole; twenty-six carlini, one zechino; twenty carlini, one ongaro.

With respect to the divisions of this country, antient and modern, it was originally formed into a multitude of small states, and afterwards the Gauls settling in the western, and many Greek colonies in the eastern provinces, it was, from its different inhabitants, divided into three large parts, called Gallia Cisalpina, Italy properly so called, and Magna Grecia; and this division is generally met with among antient geographers and historians. But the Romans at length subdued all Italy, after which it was divided by Augustus into eleven provinces; but his authority dying with him, the old division was again received, and continued under the Roman emperors till the invasion of the Goths and Herulians in the fifth century. The Grecian or eastern emperors at length drove out the Ostrogoths, and made themselves masters of Italy. But the Longobardi possessing themselves of the upper parts, at last reduced what belonged to the eastern emperors under the name of the exarchate; which was also on the other side abolished by the Saracens, who had seized upon Sicily and Naples. The pope thus on the point of losing all, had recourse to the Franks, and Charlemagne their king, after his conquering the kingdom of Lombardy, was proclaimed Roman emperor at Rome on the twenty-fifth of December, 800. But the authority of the Roman emperor was of short continuance in Italy, it being insensibly curtailed by the ambition and avarice of the popes, and at last brought to the lowest ebb on the extinction of the Swabian line. Hence Italy was again parcelled out into a great number of small territories.

Mr. Addison's observations on this subject are extremely just: "If a man considers, says he, the face of Italy in general, one would think that nature had laid it out into such a variety of states and governments as one finds in it. For as the Alps at one end, and the long range of Apennines, that passes through the body of it, branch out on all sides into several different divisions, they serve as so many natural boundaries and fortifications to the little territories that lie among them. Accordingly we find the whole country cut into a multitude of particular kingdoms and commonwealths in the oldest accounts we have of it, till the power of the Romans, like a torrent that overflows its banks, bore down all before it, and spread itself into the remotest corners of the nation. But as this exorbitant power became unable to support itself, we find the government of Italy again broken into such a variety of sub-divisions as naturally suits with its situation."

Italy includes both the main land and the islands. The main land is commonly divided into three large parts, the

the Upper, Middle, and Lower. This division is very proper, and coincides with that of the antient geographers. Upper Italy at present contains the greatest part of the antient Gallia Cisalpina and Lombardy; which consists of seven large duchies, ten small principalities, and three republics. Middle Italy forms a part of Gallia Cisalpina and of the antient Italy, or, in other words, of the grand duchy of Tuscany, the ecclesiastical state, and some other small countries. Lower Italy contains a part of the antient Italy Proper, and Magna Grecia, at present the kingdom of Naples. We shall begin with Upper Italy, and, in giving an account of the several states, shall comprehend under one head the description of the countries belonging to the same prince, whether on the continent, or in the islands.

In describing the several countries of Upper Italy, we shall first treat of the king of Sardinia's dominions, and having given an account of those on the continent of Italy, shall from thence proceed to the kingdom and island of Sardinia; previously observing, that this kingdom and the principality of Piedmont are independent countries, but that the duchies of Savoy and Monferrat are fiefs of the empire.

S E C T. II.

Of the Duchy of SAVOY.

Its Situation, Extent, and Produce; a particular Description of the Montagnes Maudites, or Cursed Mountains; and of the Alavanches, or monstrous Snow-Balls. Of the Rivers and Lakes of Savoy, particularly of the astonishing Course of the Arvo, and the Road near it. The Manners and Way of Life of the Savoyards, with a particular Account of their Method of carrying Travellers over Mount Cenis, and of their sliding down from that Mountain. The Oppression of the Nobility, with the Titles and Arms of the King of Sardinia; an Account of the principal Order of Knighthood, with the Prerogatives and Revenues of the Sovereign. A concise Account of the principal Places in Savoy.

THE duchy of Savoy, called in Latin Sabaudia, is bounded on the west by France; on the south by France and Piedmont; on the east by Piedmont, the Milanese, and Swisserland; and on the north by the lake of Geneva, by which it is separated from Swisserland. Its greatest length from east to west is eighty-eight English miles, and its breadth from north to south seventy-six.

Savoy seems sequestered from all incentives to luxury and softness, by their lofty barren mountains and enormous rocks, by which the greater part of it is overrun, and are known to produce only some moss and shrubs, with box-trees, which grow in such plenty, that brooms are made of them. The valleys between the mountains yield some grain; but abound more in pasture; for the industry of the inhabitants has made the best improvements in the mountains themselves which the soil would admit of. The wine about the lake of Geneva, Momelian, and St. John Maurienne, is not contemptible; and some parts have such a good breed of cattle, that most of the oxen in Piedmont and the Milanese are sent from Savoy. Mules are also bred for exportation; but all this is inconsiderable in proportion to the greatest part of the country, which is taken up by huge mountains.

Some of the highest of these mountains are called the Glacieres, or Ice Valleys, and the Montagnes Maudites, or Cursed Mountains in Faucigny, the perpendicular height of the latter, from the surface of the lake of Geneva, is computed to be at least two thousand fathoms, which are equal to twelve thousand eight hundred and sixteen feet, or above two English miles; and the surface of the lake of Geneva is four hundred and twenty-six fathoms higher than the level of the Mediterranean. The ascent to these mountains is very steep, craggy, and slippery, but not continued; a new ridge of mountains frequently appearing on the other side, higher and more steep than that which is left behind; till at length, from the last eminence to be surmounted, the prospect of the frozen valley appears in full view, and on the opposite

side a chain of craggy inaccessible rocks, covered with ice and snow, and so scarped and split, that at some distance they appear like prodigious piles of Gothic buildings and ruins, while the surface of the frozen valley below seems speckled, if we may thus express ourselves with rocks of a monstrous size, that are broken off, and fallen from the higher grounds. Here the air is so extremely cold and piercing, that though the months of July and August are alone fit for this journey, men are then forced to go cloathed as in the depth of winter. Mr. Addison observes, with respect to the sharp rocks on the tops of the mountains, that they were probably once much higher than they are at present, the rains having washed away abundance of the soil, and left the veins of stone shooting out of them; as in a decayed body, the flesh continues shrinking from the bones.

It is proper here to take notice of the Alavanches, or monstrous snow-balls, which are the more dreadful as they always come suddenly down with such incredible rapidity, that they carry all before them; so that whenever they happen to fall along these steep declivities, it is next to impossible for travellers to avoid being swept away with them. They are commonly occasioned only by the dropping of some small quantity of snow blown by the wind from some prominent rock, or shook off by the stumbling of a horse, the firing of a gun or pistol, or by any thing else that shakes the air. This piece of snow, though at first very small, rolling down the steep descents, gathers up such fresh quantities as it rolls, and increases so astonishingly in bulk, that it tears up trees and sometimes part of a wood by the roots, with houses, churches, men, and horses, nothing being able to resist the force of these balls, till they have got quite down to the bottom, where they generally break in pieces by the violence of the shock, and sometimes cover a whole village, which lies buried under it. These balls are more particularly dangerous for travellers in those roads which are along the sides of the high mountains, where, to prevent their being overtaken by them, they commonly fire a pistol or gun at every quarter or half a mile, to shake off all the loose snow that is apt to occasion them; after which they travel through that space with all the silence and speed they can.

These amazing kind of snow balls are not peculiar to this country; but are common in Swisserland, several parts of Germany, and Italy; but they are more frequently found in these parts of Savoy, where they are also larger and more dreadful. Some of them by the tract they leave behind are found to be above a hundred yards in diameter. In the year 1695 one of them fell upon a village called Valmedia, which destroyed eleven houses, and as many barns and stables so entirely, that there scarce remained one stone upon another; and a number of men, women, children, and cattle were lost. The noise they make resembles a long and loud clap of thunder, and is heard among the echoing rocks and mountains at several leagues distance; and yet so rapid is their motion, that passengers have not time to avoid them.

The chief rivers in this country are, the Rhine, which flows out of the lake of Geneva, and on that side separates it from France; into it run the following rivers: the Arvo, which rises in Faucigny, and, near Geneva, discharges itself into the Rhone: the Susses and Siers, the sources of which are in the Genevois, and fall into the Rhone near the Seisel: the Isere, which rises at the foot of Mount Iseran, and, among other rivers, receives the Arc, which, having a great many water-falls, is very rapid, and full of foam.

The river Arvo, just mentioned, runs for many miles between high craggy and inaccessible rocks, which seem as if split on purpose to give its rapid waters a free passage. The surprising echoes and continual sounds occasioned by its streams, the trampling of the horses and mules, the hallowing of passengers, &c. in these places are reverberated three, four, and even in some parts six or seven times, with such frightful loudness, as strikes the traveller unaccustomed to them with terror; and the firing of a gun, or pistol, is here more terrible than the loudest claps of thunder. The roads which are cut along the sides of the steep rocks, and in many places are not above five or six feet wide, afford both above and below

the dreadful prospect of a steep precipice, with impending monstrous rocks that seem just ready to fall, which, joined to the roaring noise of the river, strikes the amazed beholder with horror. The great cataracts of that river in several places are more or less loud and terrible, according as the waters are more or less swelled by the melting snows, with which the tops of the mountains are covered. One in particular, called by the inhabitants the Nun of Arpena, falls from a prodigious high rock with great noise and violence. The fall of this cataract is here said to be above eleven hundred feet. We shall only add, that the Arvo, which travellers are obliged to cross over seven or eight times, has all along that way bridges, some very strong and beautiful, and others so old and crazy, that it is almost impossible to pass over them without fear.

Besides the four rivers above-mentioned there are many smaller ones, with innumerable springs and rivulets which flow down from the adjacent hills; and what appears surprising, many of these, which are several yards in breadth, run a long way by the sides and declivities of the hills two or three miles above the valleys, watering a number of large villages situated along the hills before they fall down into the plains. The beds of these rivulets seem indeed to have been made by art, and are deep enough to receive the waters that come from the higher parts of the mountains, which increase with their course, till meeting with some impediments, they fall with great violence into the flat grounds, and there either form themselves into lakes, or discharge themselves into some of the greater rivers.

The principal lakes are those of Annecy in the Genevois, and Bourget in Savoy. The last has a fish unknown in other countries, called lavaretta, which frequently weighs four or five pounds, and is so palatable, that it never fails of bringing a good price at Chamberry. Here are also some remarkable springs, particularly near the lake of Bourget is one that rises and falls with some noise; but not at stated and regular times. After Easter this alteration is frequently perceived six times in an hour; but in dry seasons not above once or twice: it issues from a rock, and is called la Fontaine de Merveille. Of a different kind are the springs of this country, that sometimes throw up more or less water, according to the alterations in the Rhone; but not by such a short and frequent flux and reflux as in the spring just mentioned.

The Savoyards, from the nature of their country, are generally so poor, that a traveller meets few people on the public road, who do not recommend themselves to his benevolence; and a farmer with a yoke of oxen, two horses, four cows, a few goats and sheep, and a small parcel of land, is esteemed a man of considerable fortune. Their bread is of oats; but the more wealthy use some wheat. Their other food consists of butter, cheese, walnuts, garden-stuff, and sometimes, though seldom, flesh meat; and their drink is milk and good water. However, those who live in the valleys fare somewhat better. They are all, however, chearful, have healthful florid complexions, and are remarkable for their fecundity. Among both sexes a great many are seen deformed and lame; and the women in particular have wens that reach from ear to ear. One-third at least of the males seek a subsistence in France and other countries in quality of chimney-sweepers, shoe-blacks, raryshew men, &c. yet they are so honest, that they may be trusted to change gold; and if they are once able to set up a little shop, they are such masters of the thriving talents, that it is often the foundation of a very considerable fortune; yet so prevalent is the love of their country, that when they have acquired a little stock abroad, they generally return home.

The inhabitants of Mount Cennis, and the neighbouring mountains are called Marrons, or Marroniers. "One would imagine, says Mr. Keyser, that from the heavy burthens they daily carry up these steep mountains, they would soon or late fall into consumptions. In our cities in Germany, what a noise do our chairmen make, if they are to carry a person of any bulk two or three hundred paces; while here the chairmen, without the least panting or resting, run directly up a mountain, whose height is a good hour's journey,

"and then on the plain above outstrip us; and as soon as they have refitted the chairs, which is dispatched in a few minutes, they carry the company over the worst part of the way, for two hours together, making only four pauses, and those very short; such is the effect of custom, and of the simple diet to which they owe their uncommon longevity, many of them attaining to above a hundred years of age. Their usual drink is milk, and they seldom taste any wine. The better to secure their footing, their shoes are without heels, and the soles rubbed with wax and rosin. The machines in which travellers are carried are a kind of straw chairs, with low backs, two arms, and instead of feet a little board hanging down by cords for resting the travellers legs. The seat, which is made of bark and ropes twisted together, is fastened to two poles, and carried like a sedan, with broad leathern straps."

In winter the plain on the top of Mount Cennis, being covered with snow, is crossed in sledges drawn by a horse or a mule. The descent is in some places always performed in chairs; but from Mount Cennis to Lanenburg, it is conducted in a very extraordinary manner. On the spot where the declivity begins is a house called la Ramasse, where the travellers getting into a sledge, with his guide, slides down with such swiftness, that he is carried about three miles in seven or eight minutes, the rapidity of the motion almost taking away his breath. The guide sits forward steering with a stick, and has on each side an iron chain, which he drops like an anchor, either to slacken the course of the sledge, or to stop it. Travellers having been sometimes much imposed upon, the king has lately laid a tax on all kind of carriages over the mountain; and on both sides is an officer, to whom travellers, in case of any imposition, may apply for redress.

In Savoy every one speaks French, and most of the names of the towns and villages are of that language; but the inhabitants in their customs and dispositions resemble the Germans. They are all of the Romish religion; but do not acknowledge the decrees of the council of Trent.

The nobility both in Savoy and Piedmont are greatly oppressed; the king's ordinances are, however, in some respects of advantage to them, by having established in all fiefs the perpetual right of primogeniture. In 1724 the king resumed all the alienated domains, by which means the dignity of the antient nobility gradually declines, as it also does by the continual increase of the new; for whoever purchases an estate that has the title of a marquise or barony, is thereby enobled and stiled marquis or baron, and such estates may be purchased of the king for six or eight thousand livres. Every nobleman must prove from whence he derives his arms, or else is deprived of the right of using them, and must be at the expence of purchasing a new coat; and an escutcheon intirely new costs from ten to sixteen thousand livres. In order to bear the title of duke, prince, marquis, count, or baron, it is necessary to have a patent signed by the king or his ancestors, and the same also registered.

The liberty of hunting is under severe restrictions, and of all mines discovered and worked a certain share belongs to the king. No person is to fell trees even in his own wood, without leave obtained from the intendant; nor is any timber to be exported. No money is to be placed at interest or lent on mortgage out of the country: nor is any pension or order of knighthood except that of Malta to be accepted of, from any foreign prince. The nobility are prohibited from entering into any foreign service, or travelling abroad without a written licence from the king. None are to be seen with fire-arms out of their fief; and a person not possessed of a fief, and even the officers in the army, are not to keep any.

A foreigner who intends to settle in the country must be naturalized and take the oath of allegiance; but if he afterwards happens to be above three years out of the country, he forfeits all his privileges. No foreigner, who is not naturalized, is capable of being heir to a Savoyard or Piedmontese.

The present royal family of Savoy has long been dignified with the title of royal highness on account of their claim

claim to the kingdom of Cyprus, though till the year 1713 that house was only in possession of the ducal dignity. In that year Victor Amadeus II. duke of Savoy, obtaining the kingdom of Sicily on the peace with France, assumed the royal title, and was actually crowned king of Sicily at Palermo. Such he continued till 1718, when, agreeably to the quadruple alliance, he resigned the kingdom of Sicily to the emperor Charles VI. and in the room of it had Sardinia ceded to him as a kingdom, which he took possession of in 1720.

The titles of the king of Sardinia run thus: Charles Emanuel III. by the grace of God king of Sardinia, Cyprus, and Jerusalem; duke of Savoy, Montferrat, Chablais, Aosta, and the country of Geneva; prince of Piedmont and Oneglia; marquis of Italy, Saluzzo, Susa, Ivrea, Ceva, le Maro, Oristan, and Sezana; count of Maurienne, Geneva, Nice, Asti, Alessandria, Tende, Gocean, and Romont; baron of le Vaud and Faucigny; lord of Vercelli, Pignerol, Tarentaise, of la Lomeline, and Val de Sesia; prince and perpetual vicar of the holy Roman empire in Italy.

The king's arms are quarterly with a point central, shield and heart-shield. The dexter field is again quartered. In the first argent is a cross potence or, with four smaller for the kingdom of Jerusalem: the second chequered argent and azure, with a crowned lion, gules, for the kingdom of Cyprus: the third or, with a crowned lion gules, for the kingdom of Armenia; and the fourth argent, a crowned lion gules, by some thought to indicate the dutchy of Luxemburg, or, according to the others, the kingdom of Cyprus. The second field consists of three parts; the dexter gules a horse rampant argent, for the dutchy of Lower Saxony: the sinister is sable and or chequered with a wreath of green, for the dutchy of Upper Saxony; and the lower point superadded argent three chapes of a cimier gules, for the dukedom of Engern. The third field is party per pale, the dexter is argent variegated with small shields sable, and a lion sable, for the dutchy of Chablais: the sinister for the dutchy of Aosta, a lion argent in a field sable. The fourth field is also party per pale, and for the dutchy of Genevois, contains chequered or and azure: the sinister for the dutchy of Montferrat, a target gules. The point or is a black eagle, for the county of Maurienne. The central shields argent, with a cross gules, and four Moors heads with ribbands argent at the cantons, for the kingdom of Sardinia. The heart-shield gules, a cross argent, denoting the dutchy of Savoy.

The principal order of knighthood is that of the Annonciada, or Annunciation, which was instituted by Amadeus VI. in 1562. The badge is always worn appendant on the breast from a gold chain round the neck. The collar is about an inch broad, and each link contains these four letters F. E. R. T. wrought in the manner of love knots. The ancient motto of the house of Savoy, alluding to these initial letters, is *Fortitudo Rhodum Ejus Tenuit*, that is, His courage preserved Rhodes. From this collar fastened to a small chain, hangs a medal representing the angel appearing to the virgin Mary, set round with gold on a silver ground, in the innermost circle of the Star with the abovementioned four letters. The circle is also environed by a silver wreath, and the wreath with fiery tongues formed in gold. All the knights of this order have the title of excellency; but none can be installed, without being first of the inferior order of St. Maurice, instituted by Amadeus VIII.

The order of St. Maurice, by maintaining in its commanderies three galleys against the Turks, bears some affinity to the order of Malta. The knights indeed are allowed to marry, but not to widows: second marriages are also prohibited; but in both cases a little money laid out at Rome procures a dispensation.

The king's prerogative is unlimited, and though superstition is carried to as great a height in this country as any where in Europe, yet, in church affairs, the authority of the pope has been reduced as low as possible. No bull can be made public without a licence from the privy council; nor can the inquisition of Turin molest or lay any one under an arrest, without previously acquainting that council. All ecclesiastical preferments are at the

king's disposal, and he is invested with the power of assigning pensions on them to the amount of one third of their income. He can also nominate a person for the dignity of cardinal, who must be created at the next promotion. His palace chapel, with the ecclesiastics that serve in it, and the foundation of Superga, instead of being under the archbishops of Turin, are subordinate to the lord almoner, who has a distinct jurisdiction. What the convents possessed before the year 1600 has been left to them as endowments out of the royal domain; but every thing else, whether moveables or immoveables, are subject to taxes equally with the laity. All civil contracts, though relating to ecclesiastics, must be transacted in the presence of the temporal judge; before whom are also tried causes wherein ecclesiastics are concerned, either as plaintiffs or defendants.

The principal boards, or colleges, are the privy council, which consists of a prime minister, two secretaries of state, and other persons of rank and great employments; the council of Sardinia is composed of the sovereign, the first president, and some other members; and the council of state, which has also its peculiar members.

The royal revenue, by the reassumption of the ancient crown lands, has received an addition of upwards of a million of Piedmontese livres. All future alienations of the domains are prohibited; the fiefs, as they escheat, are also to be added to them, and all survivorships to be annulled. The total of the revenue cannot, however, be precisely determined. The taxes are raised without farming, except that of tobacco, but are screwed up to the highest pitch, and levied with an inflexible severity, to the extreme vexation of the distressed Savoyards; while the Piedmontese landholders are considerably eased, or do not feel the burthen so sensibly.

The king's subjects in Savoy, Piedmont, and other parts of the continent, are said to amount to above two millions.

The king's military forces in 1729 consisted of between twenty and twenty-two thousand regular troops, besides the horse-guards, the maitresses, and fifteen regiments of militia, which make about six thousand men, and are trained up in the military exercises like the regular troops. In the year 1741, the army, including the militia, amounted to about forty thousand; but in time of peace the king commonly keeps no more than fifteen thousand.

The high court of justice, which is here called the Parliament, sits at Chamberry. As the king is, on account of Savoy, a member of the ancient kingdom of Arles, and a vassal of the empire, he has a seat and voice in the diet of the Germanic body.

The duchy of Savoy is divided into six provinces; these are, Chablais, Faucigny, the Genevois, Proper Savoy, the Tarantaise, and the county of Maurienne: the principal places in which are the following:

Chamberry, the capital of all Savoy, is called in ancient records Camberiacum, and Chamarium. It is situated in a pleasant valley, on the river Leise, in the forty-fifth degree forty minutes north latitude, and in the fifth degree forty-five minutes east longitude. The streets are mostly straight and clean, the town being washed by several branches of the Alban, and many springs that flow down from St. Martin's Hill. It is well built, and has several squares, and many stately edifices, though not in the modern stile; and is of a middling size, its chief strength consisting in its walls. It is the seat of the highest court, or parliament of Savoy, and the residence of many of the nobility. It belongs to the diocese of Grenoble. The collegiate church of the Holy Chapel was founded by duke Amadeus, and the head of the chapter is stiled dean of Savoy. It has often been taken and retaken; and in the year 1731, was almost entirely destroyed by fire.

Aix, in Latin Aquæ Gratiaræ, or Sabaudicæ, is, as well as the former, situated in Savoy Proper, near the lake of Bourget, eight miles to the north of Chamberry, and is celebrated for its hot baths, the use of which is free to every one, on giving a trifle to the rubbers. The lower flows from a very strong spring, and has a sulphureous taste; but the other is quite insipid. The water is clear,

clear, and of a green colour; but no fish or any other creature will live in it. Here are the ruins of a Roman triumphal arch.

Laneſbourg is a large village, in the county of Maurienne, ſeated at the foot of Mount Cenis, which lies ſo near it on the ſouth and eaſt, that, from the end of November to the 17th of January, the inhabitants never ſee the ſun, which on that day makes its firſt appearance on the tops of the mountains.

SECT. III.

The Principality of PIEDMONT.

Its Situation, Extent, and Produce, particularly of its large Truffles, and its Silk. Of the Mountains and Vallies of Piedmont, and the Animals on thoſe Mountains, particularly white Hares, the Chamois, the Bouquetin, and the Tumar; with a concise Account of the Waldenſes. Of the Rivers of Piedmont. The Perſons, Manners, Religion, and Trade of the Piedmonteſe. A particular Deſcription of the City of Turin, and other remarkable Places.

PIEDMONT, a part of the antient Lombardy, is bounded on the north by Savoy and Italy; on the weſt by France; on the ſouth by the Mediterranean and the republic of Genoa; and on the eaſt by the duchies of Montferrat and Milan; extending about one hundred and fifty miles from north to ſouth, but much leſs from eaſt to weſt. It is called Piedmont, and in Latin Piedmontium, from its ſituation at the foot of the mountains, or Alps, which ſeparate France from Italy. This country is in ſome parts mountainous, but is every where very fruitful. The plains produce fine corn, and Montferrat and the Milanefe yield great quantities of Turkey wheat, which commonly ſerves for bread, and with which people of the middle rank mix rye: the pods are uſed for fuel, and the ſtalks, being thick, ſerve to mend the roads. The hills produce plenty of wine, which, like the Italian wines, is very luſcious when new; eſpecially the white. There is alſo a tartiſh red wine, called vino bruſco, ſaid to be very wholeſome for fat people, and, on the other hand, the ſweet wine is recommended as a ſtomachic. The neighbourhood of Turin is famous for its fine fruits, and many long walks of cheſnut and mulberry trees, which produce both pleaſure and profit. Marons, or large cheſnuts, are a favourite dainty among the common people: theſe are put into an oven, and when thoroughly hot, and cooled in red wine, are dried a ſecond time in the oven, and afterwards eaten cold. Truffles grow here in ſuch abundance, that Piedmont has obtained the name of the Truffle Country. Some are black, others white marbled with red, and the larger they are the dearer. Sometimes they are found of twelve or fourteen pounds weight; and many country people earn from fixty to ſeventy dollars a year only by digging for them.

The trade in cattle is ſaid to bring into Piedmont no leſs than three millions of livres per annum. The cultivation of ſilk is alſo a profitable article, the Piedmonteſe ſilk being, on account of its fineneſs and ſtrength, eſteemed the beſt in Italy. Many peaſants annually ſell four or five rubbs of ſilk, each weighing twenty-five pounds before it is wound off from the cocons, at twenty-five ſols the pound. The fine ſilk ſells for about a Louis d'Or per pound. The Piedmonteſe gentry breed vaſt numbers of ſilk-worms under the care of their tenants, who have the eggs and mulberry-leaves delivered to them, and in return they give half the ſilk to their maſters.

The mountains contain minerals. Rochemelon, which lies eaſtward, between Ferliere and Novareſe, is eſteemed the higheſt of all the Italian Alps, and it is a day's journey to aſcend to the top, where, in clear weather, it affords a moſt beautiful proſpect over all the Milanefe, Trevigo, Venice, &c. The exploſion of a muſket is here only heard as the craſhing of a ſtick when broken. On this mountain is ſaid to have formerly ſtood a ſtatue of Jupiter, but it was made to give way to an image of the Virgin Mary, before which an annual maſs is read on the 5th of Auguſt, to a vaſt concourſe of people. Even at that time of the year, they are obliged, in ſome places, to clam-

ber over heaps of ice; and as, on this occaſion, they are to paſs one night at leaſt upon the mountain, if they are not well provided with good covering, they ſuffer extremely from the froſt. Mount Piſo, which ſtands to the ſouth of the valley of Lucern, is ſaid to be one of the moſt lofty in Europe, and is ſuppoſed to be that over which Hannibal made his memorable paſſage into Italy. The road hewn through the rock requires near two hours travelling, and is quite dark.

The vallies of Piedmont lie to the weſtward, contiguous to Dauphiné in France: theſe are the valley of Lucern, that of Perouſe, and that of St. Martin. The laſt is ſixteen Piedmonteſe miles in length, but very narrow. The lower parts abound in wine and other fruit, the middle in cheſnuts, and the upper in fine paſtures. This valley is the ſtrongeſt fortified of any; for beſides the prodigious mountains, covered at leaſt eight or ten months in the year with ſnow, and conſequently impaſſable, it is acceſſible only by a very narrow cavity called the Tower Bridge, and no broader than the rapid river, or rather brook, of Germaneſque, running through it, over which is a lofty bridge, which, on being broke down, it is impoſſible to enter the valley. On the Alps which ſurround it are ſeven fine lakes, on the ſide of the valley of Lucerne.

In the above valleys, eſpecially that of St. Martin, among the higheſt of the mountains and impaſſable rocks, are large woods and thickets, abounding in white hares, which retain that colour all the year round; beſides foxes, large pheafants, and brown and white partridges. Theſe thickets are alſo remarkable for being the haunts of bears and wolves. On the higheſt part of the Alps, and in open places, where only a little herbage grows, are found the marmotte, a kind of rock-rat, a creature ſomewhat larger than a rabbit, and in colour of a mixed brown and red. The fleſh, which is eaten, has much the taſte of pork. This animal has a very ſhrill cry, and paſſes eight or nine months of the year, that is, while the mountains are covered with ſnow, in a profound ſleep.

The chamois is a kind of wild goat, but much ſtronger; they generally keep on the mountains; but are very difficult to be caught, becauſe they place centres on the hills about them, and on the adjacent eminences, which, upon any appearance of danger, give the reſt the alarm by a certain noiſe; upon which the whole herd run down the next ſteep declivities, which they ſeem made by nature to climb up and down with ſurpriſing dexterity and ſwiftness. Their horns are ſhort, crooked, and ſmooth; their fleſh is very good, and of their ſkins is made the true chamoy leather.

The bouquetin is another kind of wild goat, but much larger and leſs ſhaggy: its conſtant abode is on the mountains, which, on account of their height, are continually covered with ſnow. It generally ſleeps on the ice, is much fleetier than the chamois, and the common people reckon the fleſh very ſtrengthening. When a perſon is deprived of the uſe of his limbs by cold, ſome drops of this creature's blood are adminiſtered in warm wine or broth, which, upon the patient being put to bed, throws him into a great ſweat, after which he recovers. It is alſo uſed in pleuritic diſorders, and in ſudden frights: and as the freſh blood cannot always be had, they dry it, and reduce it to powder. It is ſaid that theſe creatures defend themſelves with their horns, which are two or three feet long, and thick in proportion; and that when cloſely purſued they will throw themſelves down high precipices, and break their fall by the help of their horns, ſo as to receive no hurt.

Among the tame beaſts are the tumar, which, Dr. Buſching ſays, is of two ſorts, one engendered by a bull and a mare, and the other by a bull and a ſheaf: the latter ſpecies, ſays he, is conſiderably ſmaller than the firſt, and is called the biſ; the former, called baſ, has the upper mandible ſhorter than the lower, and both almoſt reſemble thoſe of ſwine; yet the inciſory teeth in the upper jaw are an inch or two more backward than in the lower, and are alſo much longer, like thoſe of hares and rabbits. The head and tail of both reſemble thoſe of an ox; but the former, inſtead of horns, has only knobs; in all other reſpects they are ſhaped either

either like a horse or an ass. Though not so large as a mule, they are of surprising strength, eat little, are very swift of foot, and are excellent beasts for travelling.

These valleys have always belonged to Piedmont. The Waldenses, or Vaudois, their inhabitants, have rendered themselves famous in history for their dissenting from the errors of the Romish church a long time before the birth of Luther and Calvin, and for the persecutions they have suffered on that account: but since the year 1730, they have not been openly molested for their religion; but, in order to suppress them by degrees, a Popish church has been built in every parish. The number of people in these valleys scarce at present exceeds seven thousand, of which one thousand are catholics.

The chief river of Piedmont is the Po, which flows out of Mount Viso. The river Sesia, the Doria, Baltea, the antient Druria, the Tenaro, and several others, run into it. The Var, antiently called the Varus, rises in the county of Nice, and, after watering it, empties itself into the Mediterranean.

The Piedmontese are esteemed lively, artful, and witty, the inhabitants of the mountain of Aosta excepted, who are farther distinguished by large wens, as are even their horses, dogs, and other animals. If the Piedmontese were allowed to give full scope to their genius, which is shackled by the Romish religion and their manner of government, great literary advancements might be seen among them; but the introducing of any books that differ in the least from the Romish tenets, is severely prohibited. Turin has an university, which is well founded and regulated after the Romish manner; but neither the Jesuits nor any other regulars are allowed openly to keep schools. This was ordered by king Victor Amadeus II. who not only new-modelled the university, but published a rule for the uniform education of youth throughout the country.

The language of the Piedmontese is a mixture of French and Italian. In this country are about fifty earldoms, fifteen marquisesates, a multitude of lordships, and twenty abbeys. Though the country be entirely popish, except some valleys inhabited by the Waldenses, the king reserves to himself the greatest part of that power in church affairs, which in many other places is given up to the pope, and the *constitution unigenitus* is here universally opposed. In the valleys of Lucerne, Peyrouse, and St. Martin bordering on Dauphine, as hath been already intimated, live the celebrated Waldenses, a name which they derive from their living in the valleys, the Italians calling them Waldeſi, that is, people of the valleys.

The chief trade of this duchy consists in hemp and silk; and though most kinds of silk commodities are made at Turin, and as good as in other places, yet they are dear, the Piedmontese workmen being less quick and expert than those of other places; and indeed this trade is of no great consequence, both on account of the high duty and the land carriage on mules.

The principal city of Piedmont is Turin, or Turino, antiently Augusta Taurinorum, the capital of all the king of Sardinia's dominions. It is seated in the forty-fourth degree fifty-six minutes north latitude, and in the seventh degree sixteen minutes east longitude, at the confluence of the Po and Doria, in a very pleasant country, that affords a most delightful prospect, the neighbouring hills being covered with villas, convents, and other buildings. The city is pretty large, the circle of the ramparts being about four miles and a half. The fortifications are remarkable for their strength, and particularly the subterraneous works, which cannot be seen without permission from the governor. The citadel is a regular pentagon, with a vaulted deep well in every bastion, so that the garrison cannot be deprived of water; and, considering the number and extent of the subterraneous works, the whole city may be almost said to stand in the air. The ground on which it is erected being a little raised above the adjacent country, no water can be conveyed into the ditches, which is here of advantage, as the mines would in a great measure be rendered unserviceable, could they be overflowed. Both the city and the citadel mutually add to each other's strength.

From the city side you pass over several bridges and ditches through an entrance, which leads to a kind of dungeon, or a large round tower, with a flat roof. This is a magazine for provisions and part of the military stores. It is bomb-proof; the French, in the siege of 1706, having thrown several hundred bombs upon it, but to no effect. This tower has also its subterraneous passages, or galleries, towards the other bastions; so that if the enemy should become masters of the latter, the dungeon alone would easily hold out fourteen days before it would be obliged to capitulate. Here is kept the main guard. On the left hand towards the area of the citadel is the commandant's house, and on the right that of the governor; both these form an elegant amphitheatre facing the area, on the left hand of which are the barracks, from which one is led by torch-light into the souterraines, which indeed are surprising. At the entrance are vaulted stables for fifty horses: a hundred and thirty paces behind these, and forty or fifty more under the main ditch, you come under the counter-guard, where are other stables for fifty horses more. Here the subterraneous passages extend in two branches, the one to the Po, the other to the distance of two or three Piedmontese miles, not so much for the sake of an outlet, as to lead to the vast number of mines, which take up every part of the ground.

In one of these galleries is shewn the place where Micha, the brave pioneer, devoted his life for the good of his country. The French were, however, greatly mistaken in thinking themselves sure of being masters of the citadel by means of this large gallery, which is broad enough for a carriage to turn about in; for the small gallery is over the larger, and has several trenches from whence they may fire upon the enemy; and, in case of necessity, iron portcullices may be let down, and granadoes, bombs, and other instruments of destruction thrown into it, through loop-holes provided for such extremities. Besides, this large gallery is fortified at the end of every thirty paces, and there are many mines underneath it.

Indeed there are properly four galleries over one another, the lowermost of which is at the depth of a hundred and seventeen feet under ground. Into these none but Germans are admitted, as being constant friends to the house of Savoy, and therefore the officer who attends foreigners here always enquires their country. The mines, counter-mines, and other subterraneous works, are very surprising. In the lowest gallery there are spiracles to let in the air and keep it dry. From the subterraneous works of the one bastion an idea may be formed of the other four. Besides all these conveniences, every one is provided with an oven, a well, and a magazine for provisions.

The walls and bastions are all lined with free-stone, and take up an hour and a half in walking round the fortifications. The walks shaded with oaks on the ramparts appear very delightful at a distance, and those who walk there have a most agreeable prospect of beautiful villas and gardens, and on one side of the mountains, which, during the greatest part of the year, are covered with snow. If Turin continues to increase in size and magnificence, as it has lately done, it will have the noblest streets of any city in Europe, they being at present exceeded by none in Germany, Holland, France, or Italy. But this is true only with respect to the New City, in which are the royal palace, New-street, and Post-street, which are all remarkably fine. From the door of the king's palace is a view which extends seventeen hundred paces over the palace court, and St. Charles's-square, along the New-street to the New Gate. The houses in St. Charles's-square are very magnificent, and have all arched piazzas, so that in the heaviest rains one may walk dry under shelter. New-street is eighteen paces broad, the houses four stories high, and every house exactly resembles that opposite to it on the other side of the street, and is at least a hundred paces in front. There are but three buildings on each side from the area before the palace, to the entrance into St. Charles's-square, where the New-street begins, which extends a hundred and twenty-three paces in front. The inner court of the

palace is a hundred and forty-four paces long: the palace du Chateau is a hundred and ninety-seven: the street between this square and that of St. Charles four hundred and twenty-three: the square of St. Charles two hundred and eighty-four: the Farther-street four hundred and fifty-seven; and the open square before the gate a hundred paces. Bernini, the celebrated architect, is said to have preferred this street to any in Italy; yet the street of the Po seems superior to it; that street is eleven hundred common paces in length, and the houses only three stories high. The spacious and lofty piazzas of the Castle-square are continued in a direct line on both sides of the street, and the houses within the gate form a fine amphitheatre.

The houses are mostly of brick, overlaid with plaister of Paris, which while new has a good effect; and, what is not commonly seen, they have a range of balconies to every story: but the houses are disfigured by the great number of paper windows.

The streets are kept clean by a very ingenious contrivance. Between the citadel and the Port de Susa the water is brought in by a canal out of the Doria, and thence conveyed through an aqueduct over the town-ditch into the city, where it is distributed at pleasure through all the streets, and carries off all the filth and soil. This contrivance also serves to clear the streets of the snow in the winter, unless it be ordered to leave it on the ground for the diversion of the prince, who often rides upon the snow in a sledge. The city is also lighted by lanthorns hung up in the streets and cross lanes.

The most splendid structure is the front of the palace where the king resides, which is built of free-stone, and superbly decorated with columns and statues, and has a magnificent stair-case, where stands a brazen statue of Victor Amadeus on a horse of white marble. The hall before the king's apartment, and the other chambers, are hung with tapestry representing the life of Cyrus. These hangings were a present from the emperor Charles V. to the house of Savoy; and both for their beauty, antiquity, and the number of pieces of which the whole set consists, are extremely valuable. The king's apartment is very well furnished, and in his bed-chamber is an admirable piece of tapestry, representing a battle in which the Lorrainers were entirely defeated.

On the left hand of the late queen's apartments, in which are some good pictures of the royal family, is a gallery in which are three hundred marble statues, most of them antiques, placed on each side of the gallery. It was on this floor, but fronting the court, that the late king resided. The closet where he conferred with his ministers is near the audience-chamber. This apartment opens into a fine gallery of paintings, in which the largest and finest pieces are by Paul Veronese. The fresco painting on the wall, and particularly that on the ceiling, is admirable, and done by the chevalier Daniel, a German.

Upon the left hand, on the second floor of the wing of the palace which looks into the garden, is the chapel of the Holy Sudary, which, that it might be adapted to the tragical relic preserved there, is built entirely of a dark grey marble. The sheet, as the clergy here pretend, in which Christ was wrapped after his crucifixion, has imprinted on both sides the bloody figure of a man, and is kept in the middle of the chapel in a tabernacle, within an inclosure of iron work. It is publicly shewn on great solemnities, as the marriage of the hereditary prince, &c. It ought not, however, to be omitted, that the pretended sudary is also shewn at Lisbon, Mentz, and in above twelve Romish churches besides.

The rest of this palace is old and of brick, as is also another palace. The royal library is worth notice. Among other spacious buildings contiguous to the palace is the king's theatre, which is reckoned a master-piece in its kind; it having five galleries, one above another, finely decorated with sculpture and gilding. Clapping, hissing, or other noisy indications of applause or dislike, are forbidden, when any of the royal family are present: a decorum that must be very agreeable to a curious spectator. The other buildings contiguous to the palace are the record-office; the new royal printing-house, which

has twelve presses; and the arsenal, which is quite new, and a well contrived structure.

In the old city the streets are crooked and narrow, though here and there are some good houses. The university, which was founded in 1405, is a large quadrangle, and is esteemed a fine building. In the inner court is a double row of piazzas over each other; and the university library, besides twenty thousand printed volumes, has a very valuable collection of antient manuscripts, which consist of a hundred and sixty-nine Hebrew, three hundred and sixty-nine Greek, a thousand and eighty-four Latin, two hundred and ten Italian, and a hundred and seventy-two French.

With regard to the ecclesiastical buildings in this city, they are very antient, and in the Gothic taste. There are forty-eight churches and convents, and seventeen more may be seen in the neighbourhood from the ramparts. The chapel of St. Laurence near the palace is the finest in the city, and is celebrated for its several marble statues and its lofty roof. The tabernacle on the great altar consists of beautiful small pillars of Oriental marble, and the pix in which the host is kept is made of lapis lazuli.

The chapel of the Holy Trinity is smaller, but has many magnificent decorations: it has a lofty cupola, superb altars, and curious works in marble of all colours. Here is also a rich foundation for pilgrims.

The Corpus Christi chapel in the green-market is remarkable for a miracle said to have been wrought there. It is pretended that in 1453 the Savoyards having pillaged Exilles, a consecrated host was brought along with the booty to Turin, packed up with some other things upon an ass; but when the beast came to this spot, he devoutly kneeled, and could not be made to stir a step farther. Mean while the box with which it was loaded flew open, and the wafer shot up into the air, where it continued hovering in the sight of the people till the bishop arrived, into whose sacred hand it gently descended, and was by him carried into this chapel.

One of the finest churches in Turin, named la Consolazione, has a miraculous image of the Virgin Mary, which brings many pecuniary offerings; and the Franciscan church in St. Charles's square is beautified on the outside with fine statues and pyramids.

The Jesuits church, though somewhat dark, is equalled by few churches in the city for fine paintings in fresco, and marble decorations. Adjacent to it is a college, which is so large as conveniently to lodge the fifty fathers of which that society consists.

Among the laudable foundations at Turin, the five hospitals for the poor, sick, and disabled, may be reckoned the most useful. The largest and finest of these hospitals is that of St. John, for lying-in women and their children, foundlings, and the sick. Such single women as are with child are admitted here, as are also those who are married. This hospital contains about twenty such patients, besides four hundred foundlings and orphans, one hundred incurables, and two hundred patients who are judged curable. The children are employed in spinning of silk, and in other works, till they are fit to be taught some mechanic trade. The ground-floor is for the male patients, and the upper story for the females; both are so lofty as to be equal in height to three ordinary stories. The beds are placed at a distance from each other, and in the center is an altar which may be seen by all the patients, who may hear mass without getting out of their beds. The front is a hundred and eighty common paces in length, and appears so magnificent that it resembles a royal palace. The annual revenue generally amounts to about thirty thousand crowns.

Another laudable foundation in this city is styled la Charité, or the hospital for the poor, which takes up a great part of the street of the Po, and has a considerable revenue arising from rents and the annual subscriptions of the citizens. The king gives every year to this hospital three hundred sacks of corn, three of which are computed to make a sufficient quantity of bread to serve one person a whole year. This house generally contains two thousand, and often three thousand poor people, picked out of the streets, and employed in several sorts of manufactures. Here the young and old of both sexes are

preserved from idleness, and provided with meat, drink, cloaths, and attendance, when sick, or grown decrepit with age. Forty soldiers in blue, with red bandoliers, are daily dispersed about the city to take up all beggars and vagrants. Those who are foreigners are banished the city, and the natives brought to the hospital. The main building consists of two quadrangles, with galleries round them, one for the men, and the other for the women. The church is worth seeing on account of its roof, on which the Ascension of the Virgin Mary is admirably painted by the chevalier Daniel; and in the passages of the ground-floor are the busts of the benefactors, with elegant Latin inscriptions.

With respect to the government of the city, the king takes care to be exactly informed in what manner the laws are executed, and has been formerly known to go by himself muffled up in a cloak, that he might with his own eyes observe the state and management of the city. In order to prevent the exactions of the peasants in raising the price of wood during winter, there are four large store-houses of wood and coals; and when the peasants endeavour to take advantage of the weather, fuel is sold at this magazine at a reasonable rate.

Turin, however, labours under several inconveniences. The thick fogs, which in autumn and winter continually rise from the Po and other waters, render the air thick and moist, and consequently unhealthy. These exhalations are of great disadvantage to the city, which is often involved in fogs and rain, while Rivoli, a town at no more than three leagues distance, enjoys the serene sky and brightest sun-shine.

Another of the most considerable disadvantages that attend this city is the foul muddy water in most of the wells, which is chiefly owing to the negligence of the people in not keeping them sweet and clean, dead dogs, cats, and other filth, being frequently thrown into them.

Besides, the inns require great regulations, to prevent travellers being imposed upon; for there is not a place in all Italy where the entertainment is so bad, considering the price. The country produces plenty of good wine, yet none of it can be obtained without paying extravagantly for it, that usually sold at the inns being the most execrable stuff imaginable. On meagre days the Papists fare extremely ill; for though the Po affords variety of fine fish, as pike, carp, perch, trout, and sturgeon, from eighty to an hundred pounds weight; the avaritious landlords will not put themselves to the expence of fresh fish, but their guests must take up either with salt-fish, or an amulette.

The manner of burying the dead is one of the most disagreeable circumstances that attends this city. The corpse is carried in procession to the grave, where it is put in the ground without any coffin. This is not only extremely shocking when the deceased happens to die of the small-pox, measles, and such contagious distempers; but may have a very unhappy effect on pregnant women, and other persons liable to catch the infection. The masked fraternities who frequently attend at funerals, and of whom nothing can be seen but the eyes, make indeed not only a dreadful but a shabby procession. It is also extremely disagreeable, that even when there is a contagious distemper in the city, three or four dead bodies are suffered to lie a whole day in the churches uncovered. Persons of rank have family vaults in the churches and chapels; but people in inferior circumstances are thrust into a vault belonging to their parish-church, fifty or a hundred together, without any coffin. Indeed these receptacles are very deep, and have several doors, the passage leading to them being vaulted. But this cannot prevent the cadaverous smell and noxious effluvia from penetrating into the churches.

In the neighbourhood of Turin are the following palaces: the most frequented by the royal family is that called la Venerie, where the court generally continues from Spring to December. It stands about a league from Turin, the road leading to it is well paved, and the greatest part of it planted on each side with trees, it running a little winding between fine meadows, fields, and vineyards.

Before the palace is a street of houses built of stone two stories high, and in a direct line, belonging to private persons. In two chambers contiguous to the king's apartment are the pictures of thirty of his majesty's ancestors, with Latin inscriptions expressing their most famous achievements. Beyond these is a chamber of pictures of the emperors of Germany, another with those of the kings of France, and a third of the kings of England, all as big as the life. The gallery is a hundred and twenty-five paces in length, twenty-two broad, and very lofty. At each door stands two large twisted pillars of red and white marble, and the pavement consists of square pieces of green and white marble. This edifice, which is extremely admired, was designed by Filippo. The royal chapel was also designed by the same architect. The cupola is of a graceful height: within it are the statues of St. Ambrose, St. Chrysostom, St. Augustine, and St. Jerom, standing on pedestals of red, green, and yellow marble. The statues, which are of a gigantic size, are of white marble, and were brought hither from Rome. The high altar is extremely beautiful, and there is scarce any kind of marble which is not to be seen, either in the pillars or altars of this chapel. The stables are two hundred and thirty paces in length, and within them are above two hundred and twenty horses. On entering them it is an established custom that a stranger must deliver up one of his gloves, which must be redeemed with a piece of money.

The road to the palace of Rivoli runs in a direct line through fields, meadows, and vineyards, and perhaps has not its equal. It was planted since the siege of Turin in 1712, the French, among other devastations, having rooted up every tree in the country. This walk affords a very beautiful prospect; at one end of the vista stands the palace of Rivoli upon an eminence, and at the other the city of Turin; and about two leagues beyond that in a straight line the magnificent church of Superga. Rivoli, besides having the best apartments, has the finest paintings, and the royal family are much better lodged there than at la Venerie or in Turin.

Near the city stands a villa of the princess of Piedmont, very agreeably situated upon an eminence. The building is not large, but regular, and the garden is in the form of an amphitheatre.

Montcallier is a spacious castle situated upon a hill on the other side of the Po, at about the distance of a league from Turin. This is a quadrangular building, with a large square tower. The hill, as well as the neighbouring country towards Alessandria, is very delightfully variegated with vineyards, corn-fields, villas, and gardens; but is at present never honoured with the presence of the royal family.

It will be proper here to take notice of the church of Superga, which was built by the late king in pursuance of a vow he made at the last siege of Turin. It stands upon the highest mountains in the neighbourhood of the city, at an hour and a half's ride on horseback. At each end of the church stand two elegant towers; and the cupola is supported by eight large Corinthian columns of dark green marble. The bases of these columns are between five and six feet high, streaked with white, and their fronts so curiously inlaid with large pieces of white and red marble, that they resemble agate. Within the dome is a gallery that has eight windows in the circumference, and is a hundred paces round. Within the dome are three galleries, one above another; the two lowest have stone balustrades, and the upper iron work. The prospect from this gallery is more beautiful than can be imagined: from thence may be seen Rivoli, with its long terrace planted with trees; the valley towards Susa; its mountains covered with snow; the meanders of the Po, the Doria, and the Stura; with the fine plains along those rivers, which extend as far as the eye can reach; the valleys and plains beyond Montcallier; as likewise the delightful eminences in the neighbourhood, covered with vineyards, gardens, and fine seats; and lastly Turin itself. Contiguous to the church is a large square building, for the occasional devout retirement of any of the royal family, where his late majesty has several times spent some weeks in Lent.

The

The other places worthy of notice in Piedmont are Fort Brunette, which has not its equal in the world, and is a very strong fortress formed to guard against the French frontier fort of Briançon, a few miles distant. It consists of eight bastions, which, together with all the out-works, are hewn out of a rock. The bastions and other works have a communication by subterraneous passages under the rocks, so large that carriages and heavy cannon, with several horses, may conveniently go from one place to another. In the whole fortress not a single building is to be seen, and of the garrison only some centinels. Batteries and mines would here be of no effect, and two thousand men, with sufficient provisions and ammunition, might easily hold out against a numerous army. This fortress commands two valleys.

Susa, formerly Segusium, a city on the Doria, and the capital of a marquisate of the same name, is seated at a small distance from the above fort, and is an inconsiderable place; but though it is only defended by a wall, it has always a strong garrison. Here is a marble triumphal arch erected by king Cottius, in honour of Augustus.

Nice, the capital of a county of the same name, which anciently belonged to Provence, is situated in the forty-third degree, forty minutes latitude, and in the seventh degree twenty-five minutes east longitude, and is a seaport at the mouth of the river Paulon; but its harbour is only convenient for small vessels, though considerable sums have been lately expended in improving it, and great encouragement given to traders by declaring it a free port. It has several remains of Roman antiquities. In 1691 it was taken by the French, and in 1696 restored to Savoy. In 1706 it was again taken by the French, who demolished part of its fortifications, and in 1708 totally destroyed them. In this principality are several other divisions besides those already mentioned, as the duchy of Aosta, the lordship of Vercelli, the marquisates of Saluzza, Ivrea, Soligno and Cleva, and the county of Asti.

S E C T. IV.

Of the other Territories subject to the King of Sardinia, as the Duchy of Montferrat, some other Districts that formerly belonged to Milan, and the Island of Sardinia. The Situation, Extent, Face of the Country, and Produce of that Island: Its History, the Manners and Customs of the Inhabitants, with a Description of Cagliari, its principal City.

THE duchy of Montferrat, stiled in Latin Mons Ferratus and Mons Ferranus, probably from the fertility of its soil, is bounded on the east by Milan, on the south by the republic of Genoa, and on the west and north by Piedmont; it is computed to be sixty-two miles in length, and forty-eight in breadth.

This country, though very hilly, is pleasant and fertile, and abounds in corn, a variety of fruit, and excellent muscadine wine; it also affords a great quantity and variety of game, especially of pheasants and partridges: it contains about two hundred cities, towns, and castles.

In 967, the emperor Otho I. is said to have raised this country to a marquisate, in favour of Aldran prince of Saxony, and upon the death of the last male heir of this house in 1305, the marquisate came to his sister Violenda, the wife of the Greek emperor Andronicus Palæologus, whose family enjoyed it till the year 1532, when the sovereignty was extinguished. In 1536, the emperor Charles V. adjudged it to the duke of Modena, whose wife was of the Palæologan family; and in 1572, Maximilian II. raised it to a duchy. In 1631, seventy-five places in the duchy of Montferrat were transferred to the duke of Savoy, in lieu of a yearly income of fifteen thousand crowns, due to him from the duke of Mantua; and in 1703, the emperor also gave to the duke of Savoy that part of Montferrat which the dukes of Mantua had held as a fief from the empire and emperor, to be held by him by the same tenure.

Cassal, the capital of the duchy, is pleasantly situated on the Po, in a delightful plain, in the forty-fifth degree

six minutes north latitude, and in the eighth degree thirty minutes east longitude, forty-two miles to the east of Turin. The town was once so well fortified, and its citadel so strong, that it was reckoned one of the most defensible places in all Italy. It was surrounded with very strong ramparts, a large ditch, with bastions, ravelins, and other works, to which the duke of Modena added a very noble citadel which had six bastions. This city has a bishop, who is suffragan to the archbishop of Milan, and is famous for its many sieges.

Here are also Crescentino, a fortified town and marquisate, and also the marquisate of Pomaro; with the towns of Trino, Verua, St. Salvitore, and some others.

The king of Sardinia possesses several districts which formerly belonged to the duchy of Milan; these are the territories of Alessandrino, Lomelina, Vigevenaces, the Novarese, the Tortonese, Anghiera, St. Fedele, and Bobio.

One of the most considerable cities in these districts, is Alessandria, in the territory of Alessandrino, which took its name from pope Alexander III. who built it in 1160, and is surnamed Della Paglia, from the inhabitants for want of wood using stubble to heat their ovens for baking bread. It is seated in a marshy country on the river Tenaro, which divides it into two parts, that are joined by a wooden bridge 400 feet in length, covered over on the top. It is a strong town with an excellent citadel; the houses are of stone; but it is neither large nor handsome, though it is said to have 12,000 inhabitants. It is the see of a bishop, suffragan to the archbishop of Milan, and is endowed with some considerable privileges: the Jews, in particular, are permitted to live here, and carry on a small trade. They have a separate quarter allotted them, where they live among themselves, and when they go abroad, both men and women are obliged to appear with some mark of distinction: the former wear grey hats and long beards; the married, a grotesque kind of head-dress, and the maids go bare-headed.

When the city and its territories were ceded to the duke of Savoy, in the late wars that prince ordered a fort to be built on the other side of the Tenaro, and another in the suburbs of the city; but the emperor taking offence at these innovations, it was alledged, by the court of Turin, that such fortifications had been built in those places many years before, and that no more was meant than to repair them. If Alessandria is not covered by them, the rest of the ceded country is at least, in some measure, secured. Indeed, the king of Sardinia's dominions are greatly exposed on the Milanese side. In the cathedral of this city are some good sculptures in marble, and paintings in fresco. Upon the pavement of a chapel is an humble epitaph, which informs us that "Philip Maria Resta, the least of bishops, and the greatest of sinners, recommends himself to the prayers of the reader." In another chapel, a square stone over the entrance of a vault has the following extraordinary inscription:—"For the benefit of the pious worshippers of the virgin mother of God, who expired while her son hung on the cross, the governors of this chapel caused this vault to be dug in virgin ground, that the dead, as well as the living, may feel the influences of the mother of mercy."

We now come to that part of the king of Sardinia's dominions, from whence he obtains the titles of royalty.

Sardinia is situated in the Mediterranean; and, on the northward, is divided from the island of Corsica by the straits of Bonifacio, it being situated between the thirty-eighth degree forty-five minutes and, the forty-first degree twenty minutes north latitude, and between the eighth degree thirty minutes, and the tenth degree twenty-five minutes east longitude. This island, next to Sicily, is the largest and most fertile island in the Mediterranean; it extending a hundred and seventy miles in length from north to south, a hundred in breadth from east to west, and about seven hundred in circuit, comprehending the turnings and windings of the coast.

The morasses, and the high mountains on the north side of this island, obstructing the wind, render the air very wholesome, upon which account the ancient Romans made it a place of banishment. The country is, however, extremely fertile, it producing all sorts of corn

and fruit. In some parts of it are woods of five or six miles in length of orange and citron trees; and as for olives, plums, pears, cherries, and chesnuts, they grow in such plenty, that they hardly yield any price. There are here also bred vast herds of large and small cattle, so that this island furnishes Italy with wool, hides, and a fine sort of cheese. Few countries afford a greater quantity of game of all sorts; the most profitable of which to the inhabitants is that of their buffaloes, wild-boars, and various kinds of deer, some of which are so finely marked, that their skins might be taken for those of tigers. The ridges of the mountains on the northern side are no less rich within than barren without, they yielding great quantities of metals and minerals. Round the coast are many sea-ports, spacious and deep enough to receive a considerable number of the largest ships, besides many inferior ones for smaller vessels.

This island has undergone many changes with respect to its government: it was once subject to the Carthaginians; the Romans held it next, and kept possession of it till the decline of their empire; when, in the ninth century, it fell into the hands of the Saracens, who were afterwards expelled by the Genoese and Pisans; from which time the inhabitants were governed by petty princes of their own. It suffered greatly during the wars between the Pisans and Genoese, as well as afterwards during those between the emperors of Germany and the popes. Boniface VIII. at last granted it, in the year 1298, to king James of Arragon, whose son, Alphonso IV. after much opposition, made himself master of it in 1324. From this time it continued under the dominion of Spain, and was governed by a viceroy, till the year 1708, when the English making a conquest of it for king Charles III. afterwards emperor, by the title of Charles VI. it was confirmed to him by the treaty of Utrecht. In 1717 it was recovered by the Spaniards, and the next year the emperor exchanged it for Sicily with the duke of Savoy, who was put in possession of it in the year 1720.

This kingdom is of more importance to the house of Savoy as a monarchy than on account of its revenues; for the charges of the army and civil officers being deducted, the remainder does not much exceed a hundred thousand livres. It is governed by a viceroy.

The whole island is divided into two parts; Capo di Lugatori forms the north part of the island, and Capo Cagliari the south. It has three archbishoprics, and four bishoprics, which, as well as the several collegiate churches in the island, are immensely rich; and both the clergy and monks have such vast privileges and immunities, that every family strives to have one or more of their children of that number: hence they swarm every where, to the no small detriment and oppression of the mercantile and working part of the inhabitants, who are forced to starve themselves to maintain the others in pride and luxury.

The inhabitants have been generally represented as brutish, ignorant, poor, proud, and lazy; so that, notwithstanding the fertility of the country, and the many advantages the inhabitants enjoy from their situation and ports, their lands are in a great measure neglected, and the people indigent: but their ignorance, poverty, and indolence, are probably owing to the tyranny and oppression of their governors and of their overgrown clergy and nobility, both which enjoy such exorbitant privileges as must necessarily cramp the industry of the middling sort of people. As for the nobility and gentry, they have always taken care to extort such privileges from their new masters, that they are not only exempt from the payment of taxes, but from being tried for any crime, even that of treason, by any but a council of seven of their peers, who uphold each other in all these cases; so that the viceroys can seldom punish the most guilty of them, by having the majority of votes on his side, and even then it only ends in some fine, or at most in banishment. This makes every one that can afford the price purchase nobility from those governors at any rate; by which means they are grown so numerous and arrogant, that the whole burthen of the public taxes, as hath already been intimated, fall on the people of the lower rank. Indeed it does not seem to have been the

design either of the crown of Spain formerly, or of Savoy since, to remedy any of these evils, and put the island in such a flourishing condition as it might soon be raised to, by the encouragement of agriculture and commerce.

Cagliari, the capital of the island, and the seat of the viceroy, of an archbishopric, and an university, is seated on a large bay of the same name, on the south part of the island, in latitude thirty-nine degrees twenty-five minutes, and in nine degrees fifty-three minutes east longitude. It has a secure harbour, capable of receiving a great number of ships of burthen, and, besides other works, is defended by a castle. The city being situated on the declivity of a hill, is divided into high and low. On the higher appears the stately cathedral covered all over with marble, and adorned both without and within with the finest architecture, sculpture, paintings, and every thing that is rich and beautiful. The whole upper town is surrounded with a good wall, and is handsome and well built; but the lower, which stands near the sea-shore, being seated just under the other, and receiving all the filth which falls down upon it, is generally dirty and unwholesome, especially in winter, and is but poorly inhabited. There are in the whole but four parishes, including the cathedrals, twenty-two monasteries, and three suburbs.

There are many small islands round Sardinia, the largest of which are Asinaria, Tavolara, Antioca, and Pietro. The most considerable of these islands is that of Asinaria, which is about twenty-five miles distant from Cape Doria, and was stiled by the ancients the great island of Hercules. It is about twenty-eight miles in compass, and is seated in the forty-first degree north latitude, and in the eighth degree forty-five minutes east longitude.

Having now concluded our account of the dominions of the house of Sardinia, we shall proceed to those of Austria in Upper Italy.

SECT. V.

Of the Dutchy of MILAN.

The Situation, Extent, and Produce of the Milanese; with the Trade, Revenues, Forces, Manners, and Customs of the Inhabitants. A particular Description of the Lake called Lago Maggiore, with its two beautiful Islands Isola Madre and Isola Bella, and of the City of Milan.

THE Austrian dominions in Upper Italy at present consist of the most considerable part of the dutchy of Milan, including Pavia, Cremona, &c. and the entire dutchy of Mantua.

The dutchy of Milan is bounded to the westward by Savoy, Piedmont, and Montferrat; on the north by Swisserland; on the east by the territories of Venice, and the dutchies of Mantua, Parma, and Placentia; and on the south by the dependencies of the republic of Genoa; extending from south to north upwards of a hundred English miles, and in its greatest length from east to west above a hundred and eight.

There is scarce a country in Europe more fertile in a variety of excellent productions. It is every where watered either by rivulets or canals, and, after the harvest of the usual kinds of grain, the people sow Turkey wheat, chiefly on account of their poultry, which they have in great plenty, and exceeding good. The pastures are very rich, especially in the district of Lodi, which is famous for the breeding of cattle. The cheese made in the country, and improperly called Parmesan, is used all over Italy in the best soups. Here are also excellent wines, and all manner of vegetables and fruits in perfection; together with a considerable number of mulberry-trees for breeding the silk-worms. The charms of this country are also heightened by three large and beautiful lakes: these are the Lago Maggiore, the Lago di Lugano, which is twenty English miles in length, and the Lago di Como, which extends from north to south thirty-six Italian miles.

The trade of the Milanese is considerable; but the greatest part of the commodities the country affords is consumed

consumed by the inhabitants, their exports generally coming far short of their imports. They, however, manufacture great quantities of woollen and linen cloths; silk is also here in great plenty, but it is not so fine as the Piedmontese, and the stuffs made of it are chiefly for home consumption; but the fine silk stockings, gloves, and handkerchiefs made here are usually exported. Milan is also famous for its curious works in steel, crystal, agates, hyacinths, and other gems; and the country every where abounds with ingenious artificers.

From the extraordinary fertility and richness of this country, it may be supposed to produce a considerable revenue for its sovereign. It is said to have brought in to the kings of Spain above two millions of dollars per annum; and Keysser says, that the Austrian general-governor has an annual income of two hundred thousand florins.

The regular forces in the dutchy amount to eighteen thousand men, the greatest part of whose cloathing, arms, and other necessaries, come from Germany, to the no small discontent of the Milanese, who think it hard that as the money for the payment of these troops is raised among them, it should not be laid out and circulated in their country.

The political vicissitudes of the state, from this country devolving from the French to the Spaniards, and from these to the Germans, have occasioned the resort of troops into this dutchy composed of these different nations; and these have introduced a much more social and free way of living than is found in the south parts of Italy. To these the fertility of the country and the wealth of the nobility do not a little contribute. The ladies can hardly be under less restraint even in France than they are here; for, during the carnival, they give balls and masquerades by turns at the public taverns, in order to avoid the inconveniencies with which such entertainments would be attended at their own houses; while their husbands seem perfectly easy with regard to these festivals, either from pusillanimity or a confidence in the virtue and discretion of their ladies, and some are so passionately fond of them as to grudge them nothing that can contribute to their pleasure. The women of the lower class imitate their superiors as much as possible, and indulge themselves in liberties which in other parts of Italy are denied them. Here, as in Paris, trade is mostly managed by women, who amuse themselves with sewing and embroidery, and the shops, though they are quite open while the season permits, are places of rendezvous for a great deal of company. Even in convents the austerities of the monastic life are so far relaxed, that a traveller may not only talk, rally, and laugh with the nuns at the grate, but join in a concert with them, and spend whole afternoons in these familiarities.

We have already mentioned the beautiful lakes in this dutchy, and it will be proper before we proceed to describe the principal cities, to give a description of the Lago Maggiore, or Lago di Locarno, which is the most extraordinary. It is sixty-five Italian miles in length, in most places it is six broad, and its depth about the middle is eight fathoms. Towards Swisserland it terminates in a canal that is of vast advantage to commerce. The lake is every way environed with hills, covered with vineyards and summer-houses, and above the vineyards are plantations of chesnut trees, the fruit of which is consumed in such quantities, that when chesnuts are in great plenty, the price of corn falls, especially at Genoa. Along the banks of the lake are fine rows of trees, and walks arched with vine branches, especially near the town of Alesco. This beautiful prospect is farther heightened by large natural cascades falling from the mountains.

Two leagues from Sesti the lake begins to widen, and on entering the bay appears the two celebrated islands Isola Madre and Isola Bella; the former belonging to count Boromeo, and the latter to the emperor. These two islands have been compared to two pyramids of sweetmeats, adorned with green festoons and flowers. At one end of the garden of the Isola Bella are ten terraces, the perpendicular height of which, taken together, says Mr. Keysser, is sixty ells above the height of the water, each ell consisting of three spans. These terraces decrease

proportionably in their circuit as they rise towards the top of the hill, where an oblong area, paved with fine stone, and surrounded with a balustrade, affords a most delightful prospect. It is in length from forty-five to fifty common paces, and on every side stands a range of marble statues of a gigantic size. The rain-water runs into cisterns underneath, to which also other water is conveyed in order to supply the water-works. Round every terrace is a pleasant walk, and at the four angles are large statues and pyramids placed alternately. The walls from the bottom to the top are covered with laurel hedges, and espaliers of orange, lemon, peach-trees, &c. The laurels stand in the open air during the whole winter; but the lemon and orange-trees are sheltered over with a covering of boards, and in sharp weather cherished with heat, from fires provided for that purpose at a great expence. The annual charges of these Boromean paradises amount to forty thousand Piedmontese livres. But to raise so noble a superstructure upon such a foundation, and to bring these islands to their present incomparable beauty and magnificence, seems an undertaking beyond even the revenue of a prince to accomplish. The Isola Bella was no longer ago than the middle of the last century only a barren rock, to which every basket of earth, and whatever is found there, must have been brought by water at a prodigious expence.

The garden of Isola Bella has a south aspect, and at the two angles of its front are two round towers, in which are very lofty apartments, adorned with red and black marble. Here is also a covered gallery, supported by stone columns, and shaded with lemon-trees. On the other side, that is towards the east, is a delightful walk of large orange-trees disposed in four or five rows.

At a small distance is a fine grove of olives, with narrow walks, and a cascade that falls down above twenty steps. Here is also a plantation of large pomegranate-trees. The lake comes up so close both to the palace and gardens, as scarcely to leave so much dry ground as to set one's foot upon, except a small space before the north front of the palace, which has a fine prospect towards Isella. On the east and west sides are large vaults, upon which the earth has been raised to the height above-mentioned; and the whole may be compared to the hanging gardens of antiquity. These vaults are not only a foundation for the soil, but an ornament to the gardens, all of them resembling so many grottos. Near the palace are kept in a shed built on purpose three fine gondolas for parties of pleasure upon the water.

In the palace are a great number of fine paintings, vases, busts, and other curiosities. Among the pictures, the flower-pieces, some of which are done upon marble, cannot be sufficiently enough admired; several of the chambers are hung with portraits of the cardinals who were of the Boromean family. The vaults on which the palace stands are contiguous to the lake, and like grottos are adorned with marble and shell-work. The floor is a sort of Mosaic formed of small stones, placed so as to represent a variety of figures. Besides this assemblage of the beauties of art and nature, the lake, with its undulating waves, continually washes the entrance into these grottos; so that a more delightful summer retreat can hardly be imagined.

On going from the house towards the garden, the smell is immediately refreshed with the mingled odours of fruits and flowers. The first contre-espallier, after ascending a few steps, consists of bergamot, lemon, and citron-trees; next to this appears a high range of orange-trees, beyond which you come to a lofty grotto adorned with water-works and statues. Over its center is an unicorn of enormous size, in a springing attitude, with a Cupid on his back, and on both sides is an ascent by steps to the oblong area which terminates the ten terraces.

From Isola Bella to Isola Madre is about half an hour's sailing, though their great height makes them appear much nearer. The latter has seven terraces, which are high but sloping, and a considerable distance from each other, by which means it appears to be lower than Isola Bella, though according to the original plan they are of an equal height. The greatest part of the external foundation of Isola Madre is a high perpendicular rock, projecting considerably over the water, so that it did not require

require so much masonry as *Ifola Bella*. That part of the front of the palace is only completed which looks towards *Sesti* and the above island, and is adorned with fine paintings of flowers, portraits, and landscapes.

The garden of this island also abounds with beauties, particularly a fine espalier of citron-trees, with a low contre-espalier of orange-trees, an arched walk of cedars, a smaller espalier of jessamine, an espalier of acacia, and another of rosemary not less than eight feet in height. Here are also several small groves of laurel, with walks cut through them. Some of these trees are of an uncommon thickness; and one of these espaliers of laurels is above eighteen feet high: such a hedge, by means of the mildness of the air, and its being fenced from the north wind by the neighbouring mountains, shoots up to this height in six or seven years.

The *Ifola Madre* is a secure place for keeping of pheasants, which are easily confined here on account of the great breadth of the lake: for when any of them attempt to fly over it, they soon flag and drop into the water, from which they are immediately taken up by a waterman who puts off for that purpose, and brought back. This, however, seldom happens; for as this island is larger than *Ifola Bella*, and abounds with every thing proper for them, as well as places for shelter, they seldom attempt to make their escape. There is a little house built for the young pheasants, and near it a beautiful grove of lofty cypress trees. This appears to be the finest part of the island, and recalls to one's mind the fabulous descriptions that have been given of enchanted groves and islands. The walks through this cedar plantation lead by a descent to the summer-house near the lake. The shores of both islands are set round with painted flower-pots, and when any foreign prince comes in the night, or makes some stay here, both islands are illuminated with lights of all colours, which exhibit a very glorious spectacle.

But to return, the duchy in general is divided into the Milanese, properly so called, the earldom of *Angliera*, the districts of *Como* and *Lodigiano*, with a part of the *Pavese* and the *Cremonese*; the two last of which, with their capitals, will be described in a separate article.

Milan, in Latin *Medilanum*, the capital of the duchy, is situated in the forty-fifth degree twenty-three minutes north latitude, and in the ninth degree twenty minutes east longitude, and is ten Italian miles round; but would not, perhaps, take up half the space, were its many gardens excluded. Its chief defence is a lined rampart. The citadel stands at some distance from the city, yet, being in the form of a crescent, environs a considerable part of it. This consists of six bastions, which, with the morafs on the land side, secures it pretty well from being approached with trenches or mines. Towards the city are two turrets, the walls of which are twelve ells in thickness, and faced with square blocks of marble. The city is provided with a foundery for guns, and an arsenal with arms for twenty thousand men, and over the gate is an inscription in honour of Philip II. king of Spain, which gives him the title of defender of the faith.

The city of Milan is not to be compared for beauty and convenience with *Turin*, most of the streets being narrow and crooked. Paper windows are here also more common than either at *Turin* or *Florence*, and have a worse appearance; as even in the houses of noblemen, glass and paper are often seen in the same window, the latter being stuck on to supply the place of a broken pane. All the houses are covered with pantiles, and in many of the cross streets, and at the stations where the public processions stop, figures are erected, some of marble; but most of them of brass. The inhabitants are computed at three hundred thousand.

Here are twenty-two gates, two hundred and thirty churches, of which ninety-six are parochial, ninety convents, a hundred religious fraternities, and a hundred and twenty schools. The archbishop's cathedral, dedicated to *St. Maria and Thecla*, is four hundred and eighty feet in length, and is built in the Gothic taste. It excels in the number of its ornaments and sculptures, with which it is entirely covered both within and without; and, to form a true idea of this edifice, it is ne-

cessary to conceive a vast collection of roses, trees animals, pyramids, grotesques, statues, and a thousand other varieties, mingled without taste or regularity. The statues are done by good hands, and some of them deserve admiration, particularly one of *St. Bartholomew* just flayed, and his skin hanging over his shoulders; though some give the preference to those of *Adam* and *Eve* over the main portal. The great number of pillars that support the roof, many of which can scarce be fathomed by three men, are all of marble, of which every where, both without and within the church, there is a vast profusion. Between the pillars are placed large paintings representing the life of *St. Charles Boromeo*, and among other passages his selling the principality of *Doria*, and in one day distributing eighty thousand dollars among the poor. Near these are silver votive offerings to the weight of some thousands of ounces, representing heads, ears, and other parts of the body, which had been hurt or diseased, but supposed to have been restored to perfect soundness by the intercession of *St. Boromeo*. The silversmiths expose to sale such votive pieces of different sizes ready made, that a recovered patient may immediately pay his vow, lest his gratitude should be cooled by delay.

The church is paved with Mosaic work, formed of pieces of red, black, and white marble, inlaid so as to represent circles, foliage, festoons, flowers, &c. so that when it is viewed from the cupola, it resembles a beautiful carpet.

The tabernacle in the choir, where the host is kept, is supported by four angels of brass of the size of a man, and at some distance on each side stands another angel. The stalls of the prebends are made of walnut-tree, on which all the remarkable actions of the emperor *Theodosius* and *St. Ambrose* are admirably executed in sculpture, and every action represented on a distinct compartment. The canons are divided into three classes, thirty of which are nobles, and, like cardinals, wear a red vestment. The second class consists of wealthy citizens, who are clothed in green; and the rest wear the common habit of the clergy.

The two chancels facing the entrance of the choir are encompassed with fine brass statues, and its outside contains the history of the New Testament, admirably expressed in basso rilievo upon white marble, by *Andrea Bissi*; but the best of them is that of the birth of *Christ*, which is accounted a master-piece.

The body of *St. Charles Boromeo* is placed on the altar of a subterraneous chapel, directly under the principal cupola; it is dressed in episcopal robes, and deposited in a crystal shrine within a coffin made of wood. There is but one key to it, which is kept by the archbishop, without whose order this relic is not to be seen. The walls of the chapel are almost every where lined with silver; but the epitaph is on marble. Every fourth of November this body is exposed with great solemnity and devotion. The treasury is extremely rich, and contains a prodigious number of gold and silver vessels, bustos, statues, ostensoria, rings, chalices, crucifixes, &c. of which the metal is the least valuable part. Among these is a silver image of *St. Boromeo*, bigger than the life, with a diamond crucifix of immense value, hanging at his breast. The front of the mitre, which is always put upon the deceased archbishop's head when his body is carried in procession, is entirely covered with pearls.

On the roof of the choir hangs one of the nails with which it is pretended *Christ* was fastened to the cross; it is cased in crystal, and near it is a machine by which six persons at once may be drawn up to it. On the third of May, the festival of the invention of the cross, this relic is carried about in a grand procession, the archbishop holding it under a magnificent canopy, the whole body of the clergy, the governor-general, and the principal persons of the city assisting at the ceremony. Among other curiosities shewn here, is a piece of *Aaron's rod*, which, however, the church of *St. John de Lateran* at *Rome* pretends to have quite entire; some pieces of it are also shewn in the palace church at *Hanover* among the relics which *Henry*, surnamed the *Lion*, brought from the Holy Land.

A marble

A marble stair-case carried round one of the main pillars, leads up to the first outward gallery. Here is a marble statue of duke John Galeazzo Visconti, on the top of a pyramid, with a flag in his hand. This duke in 1386 laid the foundation of this edifice. Many statues of saints, dukes, and other eminent personages, stand round this gallery. The roof of this church will be entirely covered with marble, part of it being so already. The large square blocks of marble used for this purpose are so closely cemented together with stucco, that no rain can penetrate through the joints. Hence it may be easily conceived that the pillars and arches must sustain an immense weight. Upon one side of this gallery are marble statues of all the architects who have conducted the building of this church.

On mounting ninety-one steps higher, you come to a gallery which leads round the inside, and at the height of thirty or forty steps above this gallery, hang three large bells, one of which was consecrated by St. Charles Boromeo; and here, through an aperture, is a view of the inside of the principal cupola, which is divided into a great number of square compartments, and adorned with seventy-six statues. Four flights of steps, and other curious works enriched with statues, bring you to the top of the cupola.

With respect to the outside of this church, the eastern part, or that belonging to the choir, is completed; but the part most exposed to view, particularly the front towards the great square, is in a bad condition; probably that persons of fortune and a liberal disposition may be incited to contribute largely towards it. It is already four hundred and fifty years since the church was begun, and the whole square behind it is filled with workmen employed in sawing, cutting, and polishing the marble; and there is reason to believe that something or other will always remain to be done, a yearly income of eighteen thousand crowns being levied till the church shall be entirely completed. It is pretended that two thousand statues are still wanting for the front, and that the other parts of the edifice require at least five thousand. The number of statues about the church so long ago as the year 1714, amounted to four thousand four hundred; and some affirm, that above six hundred of those already set up, are worth a thousand dollars each: but it is not improbable, that in these computations, the word statue is a little overstrained beyond its usual import.

Opposite to the cathedral stands the archbishop's palace, a very spacious building that has two courts, in one of which are the statues of St. Charles Boromeo, and St. Ambrose; the latter with an iron rod in his hand, as an emblem of his heroic opposition to the emperor Theodosius. This palace has a communication with the cathedral by a subterraneous passage.

With respect to marble sculptures, paintings, gilding, and stucco-work, St. Alexander's church surpasses any in Milan, except the cathedral. The high altar of this church, the chancel, and two confessionals, are enriched with lapis lazuli, agate, jasper, and other gems. The life of this saint is painted on canvas in several compartments.

The church of St. Ambrose is divided between the Bernardines and the canons regular. The choir is common between them, and is, as well as the cupola, adorned with mosaic-work. The tabernacle for the host stands between four pillars of porphyry. Near the chancel is shewn upon a marble pillar, a brazen serpent, which the vulgar believe to be the same which Moses set up in the wilderness, though others, more modest, judge it to be made only of some fragments of the former; while others again imagine it to be a symbolical image of the god Æsculapius. However, on Easter Tuesday, a great number of sickly children are placed before it, from a superstitious expectation of their being restored to health.

The body of St. Ambrose is deposited near the high altar. The gates of the portal are by tradition said to be the same which St. Ambrose shut against the emperor Theodosius, till he had done penance for his cruelly massacring the inhabitants of Thessalonica on account of a sedition. Pilgrims generally pick little splinters out of these gates, and carry them away as sacred relics.

The Ambrosian college, which stands near the center of the city, is a foundation for teaching the several branches of literature, where youth are instructed gratis by sixteen professors. What is here principally worth a traveller's notice is the library, which, except in vacation time, is open every morning from ten to twelve, and also two hours in the afternoon. It contains forty-five thousand printed volumes; but these, however, are far less valuable than its treasure of manuscripts, which are said to amount to fifteen thousand; but though this number is probably much exaggerated, it must be acknowledged to contain some good pieces. The most curious manuscripts in the whole library are, a translation of Josephus's history of the Jews by Rufinus, it being reputed to be above one thousand three hundred, or according to others, one thousand one hundred years old, and written on the bark of a tree; and the works of Leonardo da Vinci. Mr. Addison observes, that in the Ambrosian library is shewn the Italian genius; for they have spent more money on pictures than on books; but among the heads of several learned men, there is no Englishman to be met with except bishop Fisher, whom Henry VIII. caused to be beheaded for not owning his supremacy. Books are indeed the least part of the furniture which people usually go to see in an Italian library; for these are generally set off, after the example of the old Greeks and Romans, with pictures, statues, and other ornaments, where they can afford them.

In an apartment behind the library are several rarities often mentioned by travellers, as a head of Titian by his own hand, with the pictures of persons eminent for their learning, among which are those of Lucretia Cornara, and Isabella de Rosales; the former of whom was mistress of seven languages, and by her skill in philosophy, gained the applause of the university of Padua.

In the Ambrosian college is also an academy of painting, where, in the summer months, the artists both in painting and sculpture frequently draw and make models from the life.

Some adjacent rooms serve for a museum, where, among other curiosities, is the skeleton of a woman of great beauty, who directed that her bones should be disposed of in this manner, that the living, by viewing the dead, might be better able to restore health to the sick. There is here also an image which walks about the room, and performs many gestures by clock-work.

The church of St. Angelo, besides the statues in the front, has abundance of fine paintings and marble sculptures; as has also the church of St. Antonio del Fuoco, which, among other paintings, has a fine piece by Annibal Carracci, and is adorned with inlaid work in the Florentine taste, consisting of pieces of oriental marble, mother of pearl, and gems, in the form of birds and flowers, and altar-pieces of the finest Florentine marble.

Before the main entrance of St. Celso's church are two large statues of Adam and Eve; the latter is particularly esteemed a master-piece. In the front are four fine statues of the Evangelists, also of white marble, with many other statues, whose pedestals are of brass. In the church are several fine pictures, as also the tomb of Annibal Fontana, the famous sculptor, with a pompous inscription, in which it is said that nature stood amazed while he transformed marble into men.

The church of St. Francis is remarkable for the massacre of the innocents, painted in fresco over the great altar, and the picture of our Saviour's feeding five thousand people.

The church of St. Giovanni da Casarotti is small, but adorned with decorations in marble: it has a vault for the interment of executed criminals, and belongs to the fraternity of Cavalieri, who wear a small cross upon one shoulder on their upper garment, and are of the best families in Milan. It is an indispensable duty incumbent on this order, that when a malefactor is to be executed, some of the members visit him the night before, in order to prepare him for the other world. At the place of execution, one of the most eminent among them ascends a ladder up to the gallows, holding the crucifix before the criminal, who goes up backwards, and at parting pronounces the benediction; while the capuchins

chins, whose usual office is here to attend criminals in their last hours, remain below. On this occasion two ladders are placed against the gallows, one for the executioner and the criminal, and the other for the cavalier, who attends masked, and when the criminal is dead, cuts him down. Others of the fraternity assist in taking up the dead body, and carrying it to the chapel in order to be interred. The fraternity have, however, few opportunities of performing these humble offices at Milan; for the soldiers are exempt from the civil jurisdiction, they being tried by martial law; and such is the fertility of the soil, and the opulence of the people, that even the poor by begging find no difficulty in obtaining subsistence, without taking to dangerous courses. Besides, the privilege of sanctuary granted to churches and monasteries, shelters many criminals from the hands of justice.

The church of St. Paolo, belonging to the Bernardine nuns, is remarkable for its fine frontispiece, upon which is a statue of the Madonna di Loretto, and the conversion of St. Paul, in basso relievo, on a single piece of white marble, in which the efforts of the horse to recover from his astonishment are most admirably expressed. Within the church the whole life of that apostle is represented in several beautiful pictures, by four brothers of the name of Campi, who are natives of Verona. The most remarkable of the other paintings are the decollation of John the Baptist, the Lord's supper, and Christ committing to St. Peter the power of the keys.

The church De la Passione is one of the finest ecclesiastical buildings in the city, particularly its front, which is crowded with excellent statues, and scripture histories in basso relievos. It belongs to the canons regular, who reside in a very stately building adjacent to it. In their refectory the Lord's supper is excellently painted, according to some, by Christopher Cibo; but others attribute it to Gaudenzio. Their garden is very large, with pleasure-walks arched over by vines, and a very fine gallery adorned on both sides with statues of black and white marble.

What appears very singular is, that both here and in other churches of the Milanese, the entrances are crowded with old women spinning, or busy about some other employment. As they do not beg, they probably conceive it to be a work of merit to spend the whole day, as it were, in the house of God.

In most churches of Milan the Ambrosian ritual is used, which differs from the Romish only in some forms of prayer, and a few ceremonies; but the convents of regulars adhere to the Romish.

Among the charitable foundations, the principal is the great hospital, a noble building, founded by duke Francisco Sforza. The middle court of this structure is surrounded by a piazza, each side consisting of twenty arches, supported by marble pillars, and is two hundred and fifty feet square, with three galleries running round the building. Besides this large court, there are eight smaller, and twenty-four wards for the sick and wounded, who are distributed according to their different diseases. The consumptive patients have their particular ward, another is appointed for fevers, a third for the small pox, a fourth for the venereal disease, &c. There are sometimes four hundred patients in the fever ward, which is very long, and in the form of a cross, with an altar in the center; so that all the patients may see it from their beds. In the admission of exposed foundlings, or of the sick and wounded, no difference is made with regard to country or religion. The protestants lie in the same wards with the other patients, but at the farther end; and while the host is elevated or carried about, a curtain is drawn between them and the rest. Thus, by a very commendable and humane indulgence, the adoration of the host is dispensed with, and the conscience freed from all compulsion; nor are strangers obliged to kneel on meeting the host, either in the churches or streets.

The number of patients exceeds one thousand five hundred, the females being distributed into nine particular wards, and the officers and servants of all ranks are said to amount to five hundred.

At the expence of the hospital, but at another place, are maintained about three hundred idiots and lunatics,

and also above five thousand foundlings, some of whom are kept in the country. The boys are brought up to handicraft trades, and the girls are taught the use of the needle and household business. It has been sometimes known, that persons in good circumstances, having no legitimate children, or near relations, have taken a child out of this hospital, and adopted it as their own. Its annual income amounts to ninety or one hundred thousand dollars. The inquisition in this city chiefly exercises its severities on the Jews, for none of that persuasion must come within the city, without first making his appearance before this tribunal, and at the Dominican convent in the suburbs of the Porta Vercellina. This court, besides ecclesiastics, consists of sixty noblemen, and one hundred and fifty reputable merchants.

It is surprizing what a number of misshapen dwarfs, and people afflicted with wens of a monstrous size, are to be found in the streets of Milan.

In most of the Milanese inns, a young traveller is generally asked whether he would have a letto fornito, which means a female bedfellow, who never unmask till she enters the bed-chamber. How dangerous is this to the morals of young travellers! and to what an extreme risque is their health exposed, while it depends on the choice of a mercenary landlord!

In the neighbourhood of the city are many beautiful seats, among which, that of the marquis Simonetti's villa, a few miles from Milan, is particularly remarkable for its surprizing echo, which towards the garden, from two wings of the building, parallel to each other, and standing at the distance of fifty-eight common paces, without windows or doors, distinctly repeats the sound of a man's voice, but chiefly the last syllable forty times, and the report of a pistol above sixty.

S E C T. VI.

A Description of the City of Pavia, and of a celebrated Carthusian Convent near that City; with an Account of the City of Cremona.

THE greatest part of the Pavese, as hath been already intimated, belongs to the king of Sardinia; and both this district and that of Cremona are included in the dutchy of Milan.

Pavia, or Ticinum, the capital of the Pavese, is situated in the forty-fifth degree eighteen minutes north latitude, and in the ninth degree forty-four minutes east longitude. It is a large, but old and desolate city on the river Tessino, with very indifferent fortifications, and a castle and citadel in the old taste. The streets are indeed broad and straight; but the houses are mean, and the city has no remains of its ancient splendor, when capital of the kingdom of Lombardy. It has nine churches, a like number of convents, and is a bishop's see; but the cathedral is old and of brick, as are most of the public edifices. In the area before it stands a brass equestrian statue called Regisola, by some thought to be Antoninus Pius, and by others Marcus Aurelius. The Augustine convent is only remarkable for the noble marble monument in which are said to be deposited the bones of St. Augustine. Its university, founded by Charlemagne and re-established by Charles IV. has seven colleges. Here is also another college founded by pope Pius V. whose statue is erected before it; but a much finer of the same pope may be seen in the college.

Five miles from Pavia is a Carthusian monument, celebrated for its magnificence. The church is remarkably superb, the front being entirely of white marble, ornamented with sculptures, and is covered with wires to secure it from being sullied or damaged. Within the church is curious iron-work, a great part of which is gilt: it is said to have cost 60,000 dollars. Here are also twelve incomparable statues of Carrara marble, four of which on the out-side represent the cardinal virtues; the other eight, which stand in the middle aisle of the church, are the four evangelists, with St. Gregory, St. Austin, St. Ambrose, and St. Jerom. Here are likewise two large basons for holy water, of curious workmanship. Besides the high altar, there are sixteen others,

in as many chapels that stand opposite to each other, exactly alike, with regard to the marble columns and the architecture, and only differing in the paintings and ornaments before the altars. The colours and disposition of the alabaster, granates, and different kinds of marble, cannot be sufficiently admired. Most of the altars are adorned in the new Florentine taste, with exquisite imitations of flowers, &c. formed of precious stones inlaid in marble. The great altar is richly adorned in this beautiful manner, and before it stand several bronze pyramids, and it is ornamented with a chandelier of the same taste. Indeed this altar glitters with a profusion of gems, and the tabernacle upon it is so curiously inlaid with onyx, lapis lazuli, agate, &c. that it is valued at eighty thousand dollars. The roof of the church is blue, with stars of gold, in imitation of the sky spangled with stars in a clear evening. In short, the splendor of this superb church is daily increasing, some distinguished artists being constantly retained for improving, and adding new ornaments.

The library of the convent is far from being answerable to its outward magnificence. The building on the right hand of the entrance into the great court has very fine apartments in the second story, in which the present empress was once entertained. In a little square garden adjoining to the convent are water-works, with which the grave fathers take a great delight in putting tricks upon other monks of their order; and whenever the conductor intends a person the favour of a deluge of water, or a shower, there is no escaping it.

There is, besides, in the area of the building a large garden of a quadrangular form, with a very beautiful walk covered over with an intertexture of vines, five hundred common paces in length, and adorned with marble statues on each side. Opposite the wall of this spacious square are the cells of the monks, built separately, with a little private garden behind every cell. The number of monks in this convent amount to between fifty and sixty.

We now come to the Cremonese, the last district we shall describe in the duchy of Milan, which is exceeding fruitful, and, besides delicious wine, produces great quantities of honey and flax.

Cremona is a walled city in the Cremonese, situated in the forty-fifth degree twenty minutes north latitude, and in the tenth degree thirty-six minutes east longitude. It stands on the Po, which has a bridge over it guarded by a fort: it is also defended by a castle, and is five Italian miles in compass. Its squares are spacious, and its houses handsome, with straight and broad streets. The cathedral is a magnificent structure, besides which there are sixty-two churches, chapels, and convents.

The Dominican church is adorned with some good paintings, and a superb altar of lapis lazuli, agate, and beautiful marble. On the ceiling is seen the picture of the virgin Mary, who, in token of her peculiar protection, lays her mantle over three monks and as many nuns of the Dominican order. In the area before the church is a statue of St. Dominic, holding a cross in his right hand, and in his left a dog with a lighted torch in his mouth. St. Peter's church, which belongs to the canons regular, is a beautiful structure, adorned with elegant paintings. The Augustines have a good library, and their church also exhibits several good pieces of painting. The university in this city is now in little repute.

Cremona owes a part of its reputation to the attempt made on that city by prince Eugene in 1702. By means of a correspondence carried on between the Imperialists and some of the citizens, and particularly with Casoli, the curate of St. Maria Nuova, a church that stood near the ramparts, he got possession of the Porta Santa and town-house, where marshal Villeroy resided, and on the first of February entered the city by a canal or aqueduct, through which the French had formerly surprized the place. But the troops which were to support this bold enterprize, having lost their way by the darkness of the night and a fog, came up too late, and gave the French time to recover from their panic, and put themselves in a posture of defence; so that the Imperialists were obliged to retreat, contenting themselves with the honour of carrying off Villeroy prisoner from a

garrison of six thousand men. The French, in the first transport of their rage against Casoli, pulled down the church of St. Maria Nuova to the ground; so that nothing of it is now to be seen. But near the place where the church stood, is shewn the subterraneous passage through which the Germans entered the city, which is now secured with a strong iron grate.

S E C T. VII.

The Dutchy of MANTUA.

Its Situation, Extent, Produce, and beautiful Face of the Country: Its History, and a Description of the City of Mantua.

THE dutchy of Mantua, also called the Mantuan, is bounded on the east by the dutchy of Ferrara and the Padovan, on the north by Bresciano and the Veronese, on the west by the Milanese, and on the south by Modena and Mirandola, extending about fifty-six English miles in length, and forty in breadth.

Its principal river is the Po, besides which it is also watered by the rivers Oglio, Menso, Secchia, and some others, all which discharge themselves into the Po.

The country abounds in corn, fruit, vegetables for the kitchen, with some wine, great quantities of flax, and a considerable number of good horses. In winter, after great rains, the road between Cremona and Mantua, which are forty Italian miles distant, is almost impassable, from the softness and depth of the soil: but this inconvenience is fully compensated by the exuberant fertility of the whole country; and one cannot sufficiently admire the verdure of the fields and meadows, which are divided by beautiful rows of trees, with abundance of vines twining round their trunks and spreading among their branches. The great number of nightingales that frequent this tract of land, by their plaintive warblings, render the charming scene still more delightful. Indeed a person who makes any stay in Italy, is so accustomed to fine prospects and enchanting landscapes, that they in time grow familiar to his eye, and are less regarded than when they first presented themselves to his view.

With respect to the history of this country, Lewis Gonzaga, having extirpated the Bonacolsi family, made himself master of Mantua in their room: he was of German descent, and took upon him the title of imperial vicar of Mantua, for which he appears to have obtained permission from the emperor Lewis of Bavaria, though the pope refused to acknowledge him as such. He was succeeded by his issue both in the government of Mantua and the imperial vicarship. In 1432 John Francis obtained from the emperor Sigismund the title of marquis, and Frederic II. who was created a duke by the emperor Charles V. by marriage obtained Montferrat, which was afterwards also raised to a dukedom. At length, on the accession of Philip duke of Anjou to the crown of Spain, the duke of Mantua, in consideration of receiving sixty thousand pistoles, and a monthly subsidy of thirty-six thousand dollars for maintaining a French garrison of four thousand men, admitted the French troops into his capital. France also engaged to procure him the restitution of the possessions that formerly belonged to the house of Gonzaga in Italy, and to make good the damages he suffered by the approaching war. But this league with France proved his ruin; he was on that account put under the ban of the empire, and in 1703 the emperor transferred to the duke of Savoy that part of the dutchy of Montferrat which the dukes of Mantua enjoyed as a fief. Two years after the Imperialists over-ran the whole dutchy of Mantua, and in 1708 duke Charles IV. dying under the ban of the empire, the house of Austria has continued in possession of this dutchy, which is now annexed to the government of the Milanese.

Mantua, the capital of the dutchy, is situated in the forty-fifth degree twelve minutes north latitude, and in the eleventh degree thirty-four minutes east longitude, and stands on a lake, or morass, formed by the inundations of the Mincio, twenty Italian miles in circumference, and two broad. The several parts of this lake have different names, and the two chief bridges extending over it to the city are Ponte di Molini, defended by

two citadels, and Ponte di St. Giorgio, with fortifications at both ends. The city is divided by the water into two almost equal parts, that have a communication with each other by means of six bridges. In the heat of summer, when the lake is low and stagnates, the air becomes so noxious, that the wealthy part of the inhabitants leave the city. The greatest part of the streets are long, broad, and straight; and the city abounds with handsome stone houses, fine squares, and magnificent churches.

On the other side of the lake are three suburbs, namely, to the north Porto Fortezza, to the north-east Il Borgo di St. Giorgio, and to the south Il Thé. The walls, which in some places are fortified with bastions, and in others plain, are computed to be about four miles in circuit. Here are in all four collegiate churches, twenty-one parochial, fourteen other churches and alms-houses, eleven oratories, forty convents, and without the city three parish churches, two other churches, and seven convents. The Jews, of whom there are about four or five thousand, live in a distinct quarter. The number of inhabitants, exclusive of the garrison, was formerly computed at fifty thousand: but in this century, since no court has been kept there, the number has so decreased, that the inhabitants scarce exceed sixteen thousand.

In the cathedral, which is the work of Julio Romano, and is a magnificent structure, are seen paintings of the most celebrated masters, as the calling of Peter and Andrew to the apostleship; the martyrdom of a female saint, whose breasts are torn off with pincers: but the finest of all is a night-piece of St. Antonio del Fuoco, by Paul Veronese, and cannot be viewed without admiration. The cathedral is very spacious, and divided by rows of pillars into five aisles. The church of St. Anthony is more famous for relics than any other in Mantua, a considerable quantity, as it is pretended, of the blood of Christ being kept in a subterraneous chapel with sixteen altars, and once every year shewn to the people. They also here pretend to have the blood of St. Longinus. The Franciscan church has an elegant inside, and such as few of the Mendicant order can shew in Italy: it has also a good library.

The building that was antiently the ducal palace, is far from being a modern structure, but is very large. The ducal gallery and museum, which was once famous, was in the year 1630 pillaged by the Imperialists under general Colalto, who took the city by storm; and all the curiosities, which were worth some millions, fell into the hands of the soldiers, by whom they were partly destroyed and partly dissipated, or sold to persons who knew little of their value. At that time a common soldier was so lucky as to get a booty of eighty ducats; but was so bad an economist as to game it all away in one night, for which Colalto caused him to be hanged the next day. However, some apartments in the palace are worth seeing, the ceiling being painted by Julio Romano, and they contain several tables of Florentine work inlaid with very beautiful pieces of lapis-lazuli and agate; some marble statues and busts; a Moor's head on a pedestal of white marble, with a turban so curiously inlaid, as to imitate very exactly a kind of Indian stuff; two large pieces of painting by Palma, two others by Costa, and a female saint in a chapel painted by Annibal Caracci. Here are also two galleries of portraits, and three saloons, which are somewhat dark, but well painted in fresco; however, but little care is taken to preserve them. The best thing here is the academy, which indeed for the grotto-work, pillars, sculpture, galleries, and height, has not its equal of the kind. However, a most valuable treasure of gold and silver crowns, statues, relics, and other altar-furniture, still remain in the palace church, where are likewise seen two capital pictures of inestimable value, one of the baptism of Constantine the Great, and the other of the martyrdom of St. Andrew, both by Costa.

The silk and other manufactures, and the general commerce of the city, were formerly extremely flourishing, but are now very inconsiderable.

At the distance of half a league from Mantua is the palace of Thé, so called from its being built in the form

of a T. The Imperial soldiers are now quartered on the ground-floor, but more care is taken of the upper apartments, on account of the fine paintings in fresco. Julio Romano drew the plan and elevation of this palace; most of the pictures were painted from his designs, and not a few of them received the finishing strokes from his pencil: the most admired are the fall of Phaeton, and Jupiter's victory over the giants.

At the distance of two Italian miles from Mantua is the duke's menagerie, called Virgiliana, from the grotto where Virgil is said to have passed the studious hours of youth; and near it is Pietola, antiently called Andes, which was the birth-place of Virgil.

S E C T. VIII.

Of the Dutchies of PARMA, PLACENTIA, and GUASTALLA.

Their Situation, Extent, Produce, and Rivers. Their History; with a Description of the Cities of Parma and Placentia.

THE following countries, including Guastalla and Modena, were, by the treaty of Aix la Chapelle, ceded by the house of Austria and king of Sardinia to the infant Don Philip, and from him were to descend to his male heirs; but in case of his dying without male issue, or that any of his descendants should be seated on the throne of the Two Sicilies, or Spain, these dominions were to revert to the former possessors; that is, to the house of Austria and the king of Sardinia.

The dutchies of Parma and Placentia have always been united. To the northward and westward they terminate on the Milanese; to the southward on the territories of Genoa; and to the eastward on the dutchy of Milan; extending fifty-six miles from east to west, and forty-four from north to south.

The soil is extremely fertile, especially in the production of olive-trees, large truffes, and chefnuts. The pastures and cattle are likewise very fine, particularly about Placentia, where the meadows may be laid under water from a small river, which, from its slimy water, fertilizes the ground. However, the celebrated Parmesan cheese is no longer made in this country, but at Lodi in the Milanese, at Trino, Bologna, and some other places. Petroleum, or rock-oil, is gathered in many places, and some without any mixture of water, as at Miano and Vizzole; but in other parts it is found floating on the surface of the water. There are here also found sexangular-crystals, and in the Apennine mountains, which run along the south frontiers of this country, are copper and iron mines.

The principal rivers are the Lenza, which partly divides the dutchy of Parma from Modena; the Taro, which rises in the dominions of Genoa, and is larger than the Lenza; both these, with the Nura and Trebia, discharge themselves into the Po.

The cities of Parma and Placentia were for a considerable time subject to the Roman empire; yet, like other Italian states, struggled for liberty, but have several times changed their masters. They have been governed by France, and by the popes; and at length pope Paul III. in the year 1545, conferred them on his natural son Peter Alvisius Farnese. Many disputes have since arisen in relation to these dutchies; but in the quadruple alliance of 1717 it was agreed, that on the demise of the duke of Tuscany and Parma, Don Carlos, the infant of Spain, should succeed to these countries; but Anthony, the last duke of the Farnese line, dying in 1731, without male issue, the infant Don Carlos was invested with the possession of those dutchies; but in 1735, it was stipulated in the preliminary articles of peace, that Don Carlos should be king of the Two Sicilies, and that the emperor should possess the dutchies of Parma and Placentia. Thus they continued in the house of Austria till the peace of Aix la Chapelle in 1748, when they were ceded to the infant Don Philip.

The prince's annual revenue is computed at between five and six hundred thousand scudi.

Parma

Parma is the capital of the duchy of the same name, and is a large and populous city, seated on the river Parma, which divides it into two parts, in the forty-fourth degree forty-five minutes north latitude, and in the eleventh degree east longitude. The streets are long and broad, and the houses are in general tolerably elegant. It is of a circular form, and about three miles round. The fortifications are far from being considerable; but on the east side stands a strong citadel. The ducal palace is on the south side of the river, and has a communication with the citadel by means of a bridge. It consists of three parts, two of which are newly built; but the gallery, which was formerly remarkable for its inestimable collection of paintings, medals, antiquities, and other curiosities, together with the library, was stripped by Don Carlos, who carried away with him every thing of value to Naples: so that the chief thing remarkable in this city is, the large theatre built by duke Renatus I. in the year 1618, in the form of a Roman amphitheatre: the pit is sixty-five common paces in length, and the stage sixty-two. In the former are twelve rows of seats, rising behind each other, and above them two galleries. There is also a smaller theatre in an adjoining hall.

Parma has several pompous churches, and its bishop is suffragan to the archbishop of Bologna. The cathedral is a noble edifice, that has several rows of Corinthian columns on the outside, and the cupola is beautifully painted by Correggio, and represents the assumption of the Virgin Mary. Near this structure is the church called Il Battisterio, the outside of which is covered with marble. In this edifice, which is of great antiquity, all children born in the city, and within two miles round, must be baptized; and here, on Easter eve, the provision of holy water is prepared for the whole city.

Here is an university, which was founded in 1599 by duke Renatus I. and also an academy instituted for the nobility in 1601, by the same patron of the sciences. It is under the direction of the Jesuits, and two hundred and fifty noblemen are admitted at once.

There are here manufactured great quantities of silk stockings, and indeed silk is the only commodity foreigners take from hence. This city and Placentia warmly dispute the precedence. In 1734 the French and Sardinian forces fortified themselves so well in the neighbourhood of this city, that being attacked by the imperial general count Merci, he lost his life, and the troops he had commanded were obliged to retire.

There are only a few inconsiderable towns in this duchy, besides the above capital.

The city of Placentia, called by the natives Piacenza, is pretty large, and deservedly obtained its name, which signifies pleasantness, from its situation in a most rich and delightful country, at a small distance from the Po. It is seated in the forty-fifth degree north latitude, and in the tenth degree twenty-four minutes east longitude. Its fortifications are inconsiderable, but the citadel is pretty strong. The streets are straight, and the principal street, called Stradone, the place of resort for taking the air, is twenty-five common paces broad, and three thousand feet long, in a direct line, with six hundred stone posts for separating the foot from the carriage way, and on both sides are eleven spacious convents. The other buildings of the city are not very remarkable, though it contains forty-five churches, twenty-eight convents, and two alms houses.

The cathedral is pretty much in the Gothic taste; but the church of the Augustines is reckoned the most beautiful, and esteemed worthy of its architect, the celebrated Vignoli. In its vestry is a singular curiosity representing the crucifixion, cut on a piece of wood by an unknown artist, who has taken pains to illustrate that great event with a multiplicity of figures, some on horseback, others on foot, and all inimitably executed. St. Maria in Compagna is also a very fine church, and St. Sixtus's church has a most beautiful monument of black and white marble, with the statue of Margaret of Austria, consort of duke Octavius. The ducal palace, though large, makes no great appearance on the outside; but within are some good apartments. In the area before the town-house, stand two admirable brass statues of

Alexander and Renatus IV. both of the house of Farnese, and dukes of Parma and Placentia.

The bishop is suffragan to the archbishop of Milan. Here is also an university. At this city begins the Via Emilia, which extends as far as Rimini on the Adriatic.

This duchy has also no other town besides its capital worthy of notice.

The duchy of Guastalla is about twelve miles in length, and five in breadth, and with the principalities of Sabionetta and Bozzolo, was formerly subject to the house of Mantua; but on the death of Joseph Maria in 1746, Maria Theresa, queen of Hungary and Bohemia, took possession of the duchy; but in 1748, resigned it by the treaty of Aix-la-Chapelle to the infant Don Philip.

The principal town of this duchy is Guastalla, which is a strong place seated near the river Po, on the confines of the duchy of Modena, fifteen miles to the north of Reggio, and is remarkable for a battle fought near it between the French and Imperialists, in 1734, to the disadvantage of the latter.

SECT. IX.

The Duchy of MODENA.

Its Situation, Extent, and Produce; with a Description of the City of Modena, and the other Places most worthy of Notice.

THE duchy of Modena is surrounded by the duchies of Parma and Mantua, the ecclesiastical state, the duchy of Florence, and the republic of Lucca; extending fifty-six miles from north to south, and between twenty-four and thirty-six from east to west.

This country abounds in corn, garden-fruits, excellent wine, and other productions. Near St. Paolo is found an excellent alkaline earth, sometimes as a powder, but more frequently as a moist oleaginous topus, which being pulverized is bright, smooth, white, and quite insipid: it is used as an excellent remedy against poison, fevers, dysenteries, and hypochondriac disorders. In the mountain Castello di Monte Baronzone, and at Fiunetto, are wells from forty to sixty feet deep, and on the water floats a reddish petroleum, which abounds most in spring and autumn. These wells are inclosed, and every fortnight the oil is skimmed off the surface. Castello di Monte Gibbio has wells of the same nature, which are not only perpetual, but yield a yellowish oil, esteemed the best in the country, and is used for embalming, varnishing, painting, and as an ingredient in some medicinal preparations. At Sassò and Quercola amber is dug out of a soil impregnated with petroleum.

Two Italian miles from Sassuolo is an aperture in the earth, which frequently, but most commonly in spring and autumn, emits smoke, flames, ashes, and stones of a strong sulphureous smell, which it sometimes throws sixty or eighty feet high. These eruptions are often attended with a very loud noise; the hill upon which is this aperture is quite barren, and during the time that the ashes and stones are briskly thrown out, the petroleous wells of Sassò and Monte Gibbio are very turbid. This hill also affords several kinds of petrifications.

The chief rivers of Modena are the Crostolo, the Secchia, and the Panaro.

The duchy of Modena, properly so called, has its name from its capital, and, besides that, and the places dependent on it, contains the province of Frignano, the valley of Cartagnana, the district of Soraggio, the duchy of Reggio, the principalities of Correggio, Carpi Novellara, the earldom of Rivolo, and the duchy of Mirandola; the principal places in which are the following:

Modena, in Latin Mutina, the capital of the whole country, and the usual residence of the duke, is a pretty large and populous city; but the streets are narrow, and the houses without either beauty or symmetry. It is seated in a spacious plain between the rivers Panaro and Secchia, in the forty-fourth degree thirty minutes latitude, and in the eleventh degree twenty-seven minutes longitude, and is almost of a circular form. It appears most beautiful at a distance, from the great number of its

its steeples and towers, especially that of the cathedral, which is very high and large; but neither the streets nor houses are handsome, nor the fortifications in good repair. The citadel is, however, a good regular fortress, but is on a level with the town; and though the houses in all parts have piazzas, they are both low and dark, and the churches in general are very little worthy of notice, though there are some fine ones. In a chamber under the tower of the cathedral is hung up by an iron chain the bucket of a well, with iron hoops; it was taken in a petty war from the inhabitants of Bologna, and is here preserved as a monument of courage and victory. The handsomest churches are those of the Jesuits, of the Theatines, and of St. Dominic. The Jesuits church, in particular, is extremely beautiful, and the roof painted from a design of father Bossi. The altars are very elegant, and behind the high altar is the history of St. Bartholomew, painted in several capital pictures by Procaccini. The bishop is a suffragan to the archbishop of Bologna. In the college founded by St. Boromeo seventy or eighty young noblemen are maintained and instructed. The ducal palace is indeed a noble and splendid structure, and the gallery of pictures, including the lobby, consists of six rooms, all filled with select pieces of the most famous masters: the most admired is Corregio's night-piece, representing the birth of Christ, with the Virgin Mary and the shepherds: the resplendence from the child, who lies in his mother's lap, in a most beautiful manner shines on the faces of the virgin and the shepherds, and illuminates the whole piece. The house of Este has been in possession of this duchy ever since the year 1288.

The city of Reggio, the capital of a duchy of the same name, was anciently called Regium Lepidi, and is situated in a very fertile plain, in the thirty-eighth degree twenty-eight minutes north latitude, and in the fifteenth degree fifty minutes east longitude. It is a small but very handsome and strong city. The citadel is said to have been built by Charles the Great, who is also supposed to have rebuilt the city, and to have surrounded it with a strong wall, which is still so firm that a cannon ball can make but little impression upon it. In the heart of the city is a square, adorned with the statue of the famous Brennus, a Gaulish chief, which is highly esteemed by the connoisseurs, and the inscriptions round the pedestal are no less curious.

Reggio is the see of a bishop suffragan to the archbishop of Bologna, and its cathedral is a large building of the Gothic order, adorned on the inside with a great variety of statues and paintings by the best masters.

The city of Mirandola is very large, strong, and beautiful, and is said to have been built by Constantine the son of Constantine the Great. It is situated in the forty-fourth degree fifty minutes latitude, and in the eleventh degree forty-five minutes east longitude, twenty-six miles to the south-east of Mantua. It is surrounded with strong and high ramparts, with seven bastions and other works, and is defended by a good citadel. It is the see of a bishop, and, besides its cathedral, has fifteen churches and convents. In 1702 it was strongly fortified by the Imperialists, and in 1705 taken by the French; but in 1707 surrendered again. In 1734 and the following year the Imperialists bravely defended it, and repulsed the enemy.

We shall next describe the four independent republics, Venice, Genoa, Lucca, and St. Marino, and shall begin with the former, with the dominions belonging to each.

S E C T. X.

Of the Republic of VENICE.

The Situation and Extent of its Territories on the Continent of Italy. A concise History of that Republic. The Persons, Dress, Manners, Customs, and Diversions of the Venetians. The different Ranks of the Nobility; with the Manner of choosing the Doge, his little Power, the Ceremony of marrying the Sea, and the different Offices of State. The Arms

of the Republic; its Orders of Knighthood, Religion, Revenues, and Forces; with a particular Description of the City of Venice.

THE dominions of the republic of Venice on the continent of Italy extend east and west from the river Adda, which flows from the lake of Como, and reach in one continued line to the duchy of Carniola, where the curve they form along the Adriatic sea is somewhat interrupted by the Austrian dominions, after which they extend from north to south along the coast of the same sea, and terminate at the province of Istria. Thus the Venetian territories are bounded on the north by Trent, Tirol, and the country of the Grisons; on the east by Carniola and the gulph of Venice; on the south by the same gulph, Romania, and the duchy of Mantua; and on the west by the duchy of Milan; extending about a hundred and eighty miles in length, and in some parts an hundred in breadth.

This is a fine champaign country, with a fruitful soil, producing rich fruits, corn, wine, and oil; with plenty of silk, rich pastures, and all sorts of cattle. Their Paduan sheep have very fine wool, and the flesh of their hogs is much valued. But we shall give a more particular account of each of the countries included in these territories, in treating of them separately, and shall begin with the republic, which is confined to the city of Venice, the capital of the whole.

With respect to the origin and advancement of this republic to the grandeur it formerly enjoyed, and its present state, it must be observed, that on the invasion of Italy in the fifth century by the Huns, under Attila their king, when they spread a general desolation wherever they came, great numbers of the people who lived near the Adriatic fled to those islands on which at present stands the celebrated city of Venice, which, about the year 421, had in some measure been built upon by the Paduans, for the advantage of commerce. Here having settled small states, they were at first governed by consuls, afterwards by tribunes, and formed a kind of republic, the council of which consisted of those magistrates. These islands became better inhabited on the succeeding incursions of the Goths and Longobardi into Italy, when multitudes from Rome and other large cities repairing thither, this state soon became able to make some head against these bold invaders; till at length the chiefs of the islands coming to an agreement with the Longobardi, were suffered to remain unmolested. This was the commencement of the city and state of Venice.

About the end of the seventh or the beginning of the eighth century the former government of these islands was abolished, and an unlimited power conferred on Paulucio Anafesto, who obtained the title of doge, or duke. Under this sovereignty the state greatly increased, till the people being oppressed, became weary of the evils of domestic despotism; and on their choosing a new duke, in 1171, curtailed his power, by assigning him a council of two hundred and forty persons, composed not only of nobles, but of commons. At length duke Ziani siding with pope Alexander III. against the emperor Frederic, obtained such a signal victory over him at sea, that the pope presented him with a ring, which he was to drop into the Adriatic, as a sign of his marriage with and perpetual sovereignty over it.

The Venetians, who had already extended their dominions into Lombardy, Dalmatia, Istria, Syria, and other places, made a very considerable acquisition in the beginning of the thirteenth century, by possessing themselves of the principal islands in the Archipelago and Mediterranean, particularly that of Candia. From this time they obtained immense profit by trading in East India goods, which they imported from Alexandria in Egypt, to which they came by the way of the Red Sea. Under duke Marino Morosini was introduced the present form of electing the doge, and at this juncture jealousy and envy occasioned the war with Genoa, which, after continuing a hundred and thirty years, was at last concluded by a treaty in 1381. During this war duke Peter Gradenigo, in 1396, ordained that none but the nobi-

lity should be capable of having a seat in the grand council, and thus the government became aristocratical.

In the fourteenth and fifteenth centuries the Venetians extended their possessions in Lombardy, and, in 1473, the last king of Cyprus appointed the state of Venice his heir. Towards the end of the fifteenth century the commerce and power of the Venetians began to decline, the Portuguese having discovered a way by sea to the East Indies, which at length opened the trade to all the maritime nations. In the sixteenth century affairs went still worse, for the pope, the emperor, France, and Spain joining in a league against them, they were stripped of all their countries and towns in the ecclesiastical state and the Milanese. They also received another severe blow from the Turks, who drove them out of the kingdom of Cyprus. In the seventeenth century a sharp contest arose between the state, the clergy, and the pope, in which, however, they had the advantage. They were also long engaged in troublesome wars with the Turks, losing Candia, and gaining part of Dalmatia and all the Morea; but even the latter, with other places and districts, the Turks recovered in the wars of the present century.

Thus has the republic of Venice continued upwards of thirteen hundred years, amidst many foreign wars and intestine commotions; its grandeur was chiefly owing to its trade, and since the decline of the former its strength and power have suffered a considerable diminution.

With respect to the persons of the Venetians, the men are handsome and well shaped, and their dress, especially that of the nobles, is grave, and yet becoming. The women are very agreeable, but their high-heeled shoes are said to make them hobble in their gait; but they seldom appear abroad, except during the carnival, at their fairs, and some other public occasions, when they are allowed to go in disguise, so that they cannot be known. At Venice is a kind of sumptuary court, which regulates the dress of the men, women, and servants; and no Venetian, of what quality soever, is allowed to wear either embroidery, gold or silver lace, or fringe. The same regulations are made with respect to their gondolas; and as for coaches they have very few, or else they would be subject to the same law. Indeed those who have been ambassadors have the privilege of wearing a stole of cloth of gold, and gold buckles in their girdles; but they are generally satisfied with wearing a little gold galloon on their black stoles.

A noble Venetian never appears in public but in his robes, which reach to his heels, and are of black cloth, lined with greyish cloth in the summer, and with ermine in winter; these robes are fastened with a belt of the same cloth, three inches broad, and adorned with silver buckles and plates. Instead of a hat he wears a long black worsted cap, with a worsted fringe, which he generally carries in his hand, that he may not incommode his large peruke. The physicians, advocates, notaries, and all those called *cittadini*, wear the same habits as the nobles, and, like them, claim the title of excellency. The manner of saluting them is to kiss their sleeve, which, about the elbow, is as wide as a moderate sack, and sometimes serves, as do also their caps, to carry provisions in from the market; for many of them are much reduced, and are brought to so low an ebb, as even to go about begging among the more opulent families. This is frequently the consequence of gaming, by which many houses that still make a figure are greatly embarrassed. The procurators of St. Mark, the *configlieri*, and others of the council, sometimes wear long red or purple robes. They are never saluted in the streets, except by those who wear the same robe. The rank of nobility is not restrained to the eldest sons, and they are not allowed to traffic, much less to marry with foreigners.

The conversation of the nobility is more desirable out of than within the city, they being then no more than private persons. The high conceit of themselves which is but too usual in the city, would there be ridiculous, and not borne with.

The women of quality do not even shew their faces in the churches; and the ordinary women wear over their

heads a large scarf, which opens a little about their eyes.

The females are educated in convents till they are married, without being allowed to see their future husbands; whence the men commonly remedy the defects of their wives by keeping mistresses. Many who are of a more tender conscience than others satisfy themselves with living with women whom they design to marry; but the ceremony is frequently deferred till a few days, or hours, before the death of one of the parties. The most general method with those who are unmarried, is to keep their mistresses at a certain allowance as long as both parties agree; and this is so frequently practised, that those who are unable to be at the expence of keeping one woman, join with two or three other men to have her between them, and without the least jealousy visit her by turns. To prevent young noblemen and gentlemen marrying too soon, or falling into worse disasters, their mothers make no scruple to bargain with a poor girl's father or mother to have her for the use of their son, at a certain rate to be paid monthly or yearly, as they can best agree.

The carnival commences here the second holiday in Christmas, when they begin to wear masks, and open the theatres and gaming-houses. The masquerade dress at Venice consists of only a night-gown or a cloak, with a mask on the face. In the beginning they act with some moderation, but the nearer they come towards Shrove-Tuesday, the more their madness increases. These extravagances are allowed by the senate of Venice, to divert the people from feeling the heavy burthen of their government, which without such amusements would be intolerable. Besides, the vast number of strangers who come to Venice from all parts, to see the diversions of the carnival, brings great sums of money to the city. "I was credibly informed, says Mr. Milson, that during the last carnival there were no less than seven sovereign princes, and thirty thousand other foreigners." The general use of masks prevents a stranger from making any acquaintance at this season, and likewise from seeing any curiosities; for no person is permitted to go into a church or convent in any disguise.

Their eunuchs make a preposterous figure in their operas; for it appears very odd to see one of these mutilated fellows act the part of a bully, and another with his withered wrinkled face representing a young lover; and in every opera a buffoon intermixes his fooleries with the most serious and tragical parts. Their comedies are so ridiculous, that in other places they would scarcely pass for tolerable farces; for Harlequin is commonly the head actor; and to make the spectators laugh, his grimaces are backed with the coarsest and most vulgar obscenity.

The assemblies where they play at *basset* are called *Ridottos*. Ten or twelve rooms may be seen with gaming tables in each, crowded with ladies of quality, gamesters, and courtezans. They have also certain rooms where liquors and sweetmeats are sold. Every person thus masked, provided he be well dressed, has the liberty of talking to the ladies of the highest quality; nobody, not even the husband himself, taking notice of what is said to his wife, because the mask is sacred; but this sometimes gives occasion to an intrigue, in a place where the scarcity of opportunities enables them to do more execution with the wink of an eye, than in other countries by a long courtship. The chief place of masquerading is St. Mark's square at Venice, where you may assume what disguise you please, provided you support the character. The Harlequins ridicule one another very handsomely, and those who personate doctors hold learned disputes; but such as have no inclination to venture upon these engagements, may appear in the habit of a nobleman, or in some foreign dress, and be only spectators; but all the maskers must be without swords.

They encourage here, likewise, during the carnivals and fairs, a set of strolling gypsies, who have a little stage, to which they draw the gazers to them by their shews and a peculiar eloquence they display in favour of their art in telling fortunes. They are furnished with a kind of tube made of tin about ten or twelve feet long, and

and those who have a mind to consult them, need but throw them a fifteen-penny piece, and clap their ear to one end of the tube, and immediately the gypsy at the other end whispers to them and resolves their questions. To raise the higher idea of their abilities, these impostors place on their little stages some paltry globes, and other astronomical instruments.

It must not be omitted that the carnival is not the only time when masks are in request at Venice, there being no feast where they are not used more or less: as at the audiences of ambassadors; on Ascension-day, &c. all which are very profitable to the watermen, who, knowing all the turns and bye-ways, keep a correspondence with the waiting-women, and for a good reward will furnish a ladder of cord for an intrigue; one of their main businesses being pimping. The Venetian gondolas may be hired either from place to place, by the hour, or by the day; and one of the best of them may be had for five or six shillings a day. They are prettily contrived, and very light. They are generally thirty or thirty-two feet long, and four or five broad, and a person may sit in them much at his ease, under a cover like that of a coach, with glasses on both sides. The boatmen are very dexterous in their business, and manage their oars with surprising facility, standing with their faces towards the place to which they are going. All the gondolas must be black, and even the little room is generally covered with black cloth or serge; but foreigners are not confined to this rule. The gondolas, particularly of the ambassadors, are extremely magnificent.

Among the several shows that are annually exhibited, there is one performed on Holy Thursday, which is peculiar to the Venetians. A set of artizans, by the help of several poles laid across each other's shoulders, build themselves up into a kind of pyramid, so that there is seen a pile of men in the air of four or five rows rising one above another; and yet the weight is so equally distributed, that every man is able to bear his part of it. The stories, if they may be so called, growing less and less in proportion as they advance higher, till a little boy represents the point of the pyramid, who, after standing thus a short time, leaps with great dexterity into the arms of one who catches him at the bottom; and in the same manner the whole edifice falls to pieces. This trick was, however, practised by the Romans.

Mr. Keyser observes, that if a traveller cannot contrive to be at Venice in carnival-time, he would advise him to be there about Holy Thursday; or if one of the two must be omitted, he says it should be the carnival: for the festival of the Ascension affords all the diversions of the carnival, as masquerades, operas, &c. except the *ridottos* and the dissolute revels about the close of the latter. But to a person of any taste the loss of those extravagant festivities is sufficiently compensated by the delightfulness of the season, the annual fair, and the solemnity of the doge's marriage with the sea. The annual fair begins on the Sunday before Ascension-day, and lasts till Whit Sunday. During this fair St. Mark's square is taken up with booths so arranged as to form several streets. On Ascension-eve vespers are performed with great pomp and splendor, and the pretended miraculous blood of Christ, with other remarkable relics kept in St. Mark's treasury, are exposed to public view in the great church dedicated to that saint.

In this republic the power is lodged in the hands of the nobility, who are said to amount to near two thousand, including those whose public employments in the provinces oblige them to reside out of Venice. On the birth of the son of a nobleman his name is entered in the golden book, otherwise he forfeits his nobility. Every noble is a member of the senate, on which account it is a received maxim, that they are all of equal dignity; yet there is a considerable difference between the interest and authority of families. To the first class belong the ancient houses whose ancestors chose the first duke, and from thence are called *le case elettorali*: these consist of twelve families, and on them preferably to others are conferred the higher offices. There are four other families who pretend to an equality with these, they being very little inferior to them in point of antiquity. Next follow eight houses nearly of the same antiquity. Duke

Gradenigo having passed a law that the council should for ever consist of the families of which it was then composed, and some others which he ennobled; this produced a second class of nobility, which consists of upwards of eighty families; and with these are also included the descendants of those who were raised to nobility after the Genoese war, on account of their large contributions towards carrying it on with vigour. The third and last class is composed of the citizens whose nobility has been purchased for a hundred thousand Venetian ducats; a resource which the republic has made use of in necessitous times for raising money. Crowned heads, with German and other princes, have thought it no degradation to be made nobles of Venice.

The nobility, as the counts and marquises in the territories of the republic, though some of them are of very ancient families, are now under great restrictions, to prevent their attempting any thing to the detriment of the state. They are excluded all offices, and at Venice must shew a due deference and proper respect for the meanest noblemen, as one of their sovereigns.

In order as much as possible to prevent all intrigues in the election of a doge, the ceremony is conducted in the following manner: Upon the decease of a doge the nobles above thirty years of age meet in the palace of St. Mark, where a number of balls equal to that of the persons present, are put into an urn. Thirty of these are gilt, and the others silvered over. Every noble, according to his seniority, draws a ball; and they who have drawn the thirty gilt balls retire into a private room to continue the election; but in drawing the gilt balls, lest more than one person of a family should happen to be appointed electors, the relations of him who drew a gilt ball are obliged to withdraw, and the same number of white balls are taken out of the vessel. After this the thirty electors who had drawn the gilt balls draw from another urn in which are twenty-one silvered and nine gilt balls: they who draw the gilded choose forty other electors, all of different families, but are allowed to name themselves of the number; and each of the four who drew first has a right of nominating five electors; but the five others can name only four each. These forty electors are again by lot reduced to twelve, who name twenty-five; the first nominating three, and each of the other two. These twenty-five draw lots a second time to be reduced to nine, and of these nine each choose five others; and from the total forty-five, eleven are again separated by lot, who choose forty-one others, who are confirmed by the grand council, and being locked up in a particular apartment of the ducal palace, there remain till they have chosen a new doge. The result of their determination is generally known in six or eight hours, and all the foregoing ceremonies seldom take up more than two days.

In order to render the election of a doge due and legal, it is necessary that out of the forty-one he should have twenty-five votes. His election is followed by a kind of coronation, the ducal cap being placed with great ceremony on his head, on the upper step of the entrance into St. Mark's church.

The doge of Venice has little more than the shadow of greatness, and has been justly defined to be in habit and state a king, in authority a counsellor, in the city a prisoner, and out of it a private person. He is not so much as to stir from the city without the council's permission; it is not in his power to pardon a criminal; all his counsellors have a constant eye over his actions, and may visit his closet every hour: he is as much subject to the laws as the meanest person, and when he dies there is no public mourning.

Were it not an evident truth that the human heart is apt to be fond of external splendor, it might be concluded that the dignity of a Venetian doge, under such disagreeable circumstances, would be rather avoided than eagerly sought after. The state and revenue of the doge on all public occasions is indeed very magnificent. He is the president of all councils; and in the great council has two votes. All the courts stand up in his presence, and pay their obeisance to him. On the other hand, he never rises from his seat, nor takes off his cap, except at the elevation of the host, before a prince of royal blood,

or a cardinal, to whom he also gives the right hand. His name is also stamped on the republic's money. All the credentials of the republic's ministers to foreign courts are made out in his name, though they are neither signed nor sealed by him. The letters of the republic's ministers, and other instruments from foreign princes, are directed to him; yet he is not to open them, but in the presence of some of the council. He has the disposal of all preferments in St. Mark's church, of which he is invested with the entire jurisdiction; and the knights of St. Mark are created by him alone. He likewise fills up the lower offices belonging to the palace: and lastly, his family is not subject to any sumptuary laws. His annual income is twelve thousand Venetian ducats: of this sum he must spend one-half on the four grand entertainments he is obliged to give every year; and to live up to his dignity, he must also spend considerably of his own fortune.

Among the other restrictions are the following: During his life none of his children or brothers can hold any of the great honorary offices, nor be sent on embassies. He is not to marry the sister or relation of a prince, without the consent of the great council; nor can he receive any present from a foreign prince. In state affairs he cannot transact the least matter without the council; nor can he resign, though he may be deposed. In general his authority is no greater than that of a private person, except he has such abilities as to influence the whole council; then indeed his authority bears the sway; but such persons are seldom chosen. On his death a formal enquiry is made whether he has abused his power; whether from a care of his own concerns, he has neglected those of the public; whether he lived agreeably to his dignity, &c. If found guilty of the things laid to his charge, his heirs are fined in proportion to the nature of the crime. Notwithstanding all this, the ducal dignity is solicited, and the person duly elected is not to decline it.

On Ascension-day, the doge, or in case of his illness, the vice-doge, who is always one of the six consiglieri, performs the annual ceremony of marrying the Adriatic Sea in a barge pompously gilt and carved. At about ten in the morning, the signal being given by the firing of great guns, and the ringing of bells, he goes on board the bucentaur, and accompanied by several thousand barks and gondolas, a great number of galleys finely ornamented, and the splendid yachts of foreign ambassadors, is rowed out to sea, about two hundred paces towards the islands of St. Lido and St. Erasmo. The patriarch and dignified clergy come on board the bucentaur, and present the doge and signoria, as they pass, with nosegays or artificial flowers, which, at their return, they make presents of to their acquaintance. The doge at his putting off and return is saluted by the cannon of a fort on the Lido, and by those on the island Erasmo, and with the small arms of the soldiers, who are drawn up along the Lido shore. These islands lie about two Italian miles from the city; and an eminence on the island of Lido affords a distinct view of this pompous procession, and of the vast number of boats, &c. which cover the surface of the water, and make a beautiful appearance. In the mean time several hymns are performed on board the bucentaur, by the band of music belonging to St. Mark's church, and several prayers appointed for the occasion are read or sung, till the doge has passed the two forts of Lido and St. Erasmo; and then he proceeds a little farther towards the Lido shore, the stern of his barge being turned towards the main sea.

Here the patriarch pours into the sea some holy water, which is said to have the virtue of preventing and allaying storms. After this the doge, thro' an aperture near his seat, drops into the sea a gold ring of a few dollars value, saying, in Latin, "We espouse thee, O sea, in token of our real and perpetual dominion over thee." After this all return, and the doge with his company is set ashore near the church of St. Nicholas, in the island of Lido, where the patriarch in person celebrates a solemn mass. In the evening the principal members of the council, and all who waited upon the doge in the bucentaur, are entertained at the ducal palace.

The bucentaur is a kind of galleas, a hundred feet in length, and twenty broad. It has forty-two benches for the rowers, which are concealed under the two great cabins, and on every bench are four rowers. It is not manned with galley slaves, but with men belonging to the arsenal, who on this occasion are allowed extraordinary pay. The bucentaur is never brought out of the arsenal but for these espousals; it being there kept dry under cover, from whence it is launched about eight days before Ascension-day, and remains on the water about eight days after the ceremony. The sculpture on this vessel represents the Pagan sea-gods, water-nymphs, sea-monsters, shells, &c. with the statues of Justice, Truth, Fidelity, Vigilance, Peace, Plenty, Apollo, and the nine Muses, the twelve months, and several other emblematical figures. The gilding cost ten or twelve thousand silver ducats. It is true, the bucentaur, says Mr. Keyser, is very beautiful in its kind, yet it must be owned that the king of Great Britain's chief yacht makes a much more splendid and noble appearance, though it did not cost near so much as the former.

In the grand council all nobles of twenty-five years of age may take their place. It usually meets on Sundays and holidays in the large hall of the ducal palace.

The senate, or *pregadi*, are a committee of the grand council, by whom they are chosen, and have the management of the most secret and important affairs of state, as the making of alliances, declaring war, concluding peace, coining money, imposing taxes, &c. They consist of sixty ordinary, and as many extraordinary members; besides the nine procurators of St. Mark, the *collegium*, the doge's six counsellors, the *il consiglio di dieci*, the censors, the judges *della quarantia criminale*, and other inferior judges; so that the whole senate consists of about three hundred persons.

Mr. Addison observes, that among all the instances of their politics, there is none more admirable than the great secrecy that reigns in their public councils. "The senate, says he, is generally as numerous as our house of commons, if we only reckon the fitting members, and yet carries its resolutions so privately, that they are seldom known till they discover themselves in the execution. It is not many years since they had before them a great debate concerning the punishment of one of their admirals, which lasted a month together, and concluded in his condemnation; yet was there none of his friends, nor of those who had engaged warmly in his defence, that gave him the least intimation of what was passing against him, till he was actually seized, and in the hands of justice."

The next council is the *collegium*, in which all public instruments directed to the state and doge are read; audiences given to foreign ministers, and other important affairs transacted. It consists of the doge, his six counsellors, the three presidents of the court of forty, the six chief officers of state, &c.

Of these three great assemblies, the presidentship is lodged in the *signoria*, or *il consiglio*, composed of the doge and his six counsellors, who consult on all matters to be laid before the grand council; open all foreign letters directed to the doge and the republic; receive petitions; and, in concert with the doge, carry many particulars into execution. This council is annually changed, and when the doge is indisposed, one of them is always vice-doge.

The procurators of St. Mark have not only the inspection of the church of St. Mark, its library, and the records of the republic; but likewise manage all affairs relating to the poor; together with wills, guardianships, the redemption of the Christian slaves, and bringing over rigid creditors to a reasonable composition. Their number never exceeds nine; they hold their office during life, and out of them the doge is generally chosen. The titular procurators of St. Mark are more numerous, the republic in a scarcity of money selling these titles.

The *consiglio di dieci* is a high penal court, which consists of ten counsellors; the doge, who is president; and his six consiglieri. Every quarter of a year three presidents of it are chosen.—The judgment of this court is without appeal, and it is much dreaded for its severity. It is the strong cement which secures the whole aristocracy,

cracy, it being chiefly instituted for the nobility, and its power extends even to the doge himself.

The state-inquisition consists of three presidents, who keep a very watchful eye over the safety of the republic; and their sagacious and vigilant attention to every thing relating to the state is so great, that to avoid the suspicion of any evil design against the government, it is absolutely necessary for every prudent person to be extremely circumspect, and to observe an almost slavish caution in speaking and acting. These inquisitors keep the keys of chests placed in several parts of the ducal palace, and shut up within the open jaws of lions heads carved in the walls; through which notes are conveyed into them by any one who pleases: and thus notice is secretly given to the republic of whatever may concern it to know. Such informations need not be signed, and are therefore generally anonymous; but if a reward is expected, the informer may at any time make himself known, by producing a piece of paper torn from the billet put into these *denuncie segrette*, as they are called, so as to tally with it. But what stress is to be laid on such secret informations, which gives such scope to malice and malevolence to spit their venom, belongs to the prudence of the inquisitors to determine.

As the *consiglio dieci* is peculiarly erected for the nobility; so the *quarantia criminale*, or the penal inferior court, takes cognizance of all other subjects of the state.

The holy inquisition, falsely so called, and which is so formidable in other Popish countries, is here confined by the republic within narrow bounds; but of this court we shall take farther notice, in treating of the religion of the Venetians.

There is a particular college, as hath been already intimated, to whose care the regulation of dress is committed by the republic. None are exempted from the jurisdiction of this college, but noblemen's wives for the first two years after their marriage, and strangers. The former are however no farther indulged, than in wearing a pearl necklace, and a gold fringe at the bottom of their gowns, and in giving their gondoliers ribbons to wear in their caps. But here also, as in other countries, the women are, in this respect, connived at, particularly the courtezans, who readily find patrons, under whose protection they trespass against this sumptuary law with impunity; though there is sometimes an instance of one or two being fined on that account. It is probably owing to the great number of persons who offend against this law, that it is not strictly put in execution.

The smaller arms of the republic are azure, a winged lion, or, with a book opened, argent, on which are these words, PAX TIBI, MARCE, EVANGELISTA MEUS, that is, "Peace to thee, Mark, my evangelist," St. Mark being the patron of Venice. The shield is surmounted by the ducal cap. The large and complete shield is composed of the arms of the several provinces and dependencies of the republic.

The principal order of knighthood is that of St. Mark; the badge of which is a large gold medal pendent on the breast. On one side is either the name of the reigning duke, or his image, with St. Mark delivering a standard to him: on the other a winged lion, holding in one paw a naked sword, and in the other a book with the above words.

The order of the Constantine knights have a cross hanging from a gold chain. The residence of the grand master is at Briana near Venice.

With respect to the state of religion, that established by law is the Roman catholic; but Greeks, Armenians, and Jews are allowed the public exercise of their worship in the countries of the republic, and Protestants observing privacy remain unmolested. The pope, after a long opposition, has obtruded on the republic a court of spiritual inquisition, the members of which are the pope's nuncio, the patriarch of Venice, an inquisitor, and three lay-assistants; but the republic has so curtailed its power, that nothing can be transacted without the assistants, who lay before the republic every case of moment. Jews, Greeks, cases of blasphemy, supposed magic and sorcery, usury, and the censure of books, are not cognizable by this court, but by the civil magistrate; and the

pope's bulls and briefs before they are made public undergo an examination, lest they should contain any thing contrary to the laws and liberties of the state.

At the head of the church is the patriarch of Venice, who is always a noble Venetian, chosen by the senate, and though confirmed by the pope, is independent of the papal chair. He is primate of Dalmatia, and of some provinces of the continent; also metropolitan over the archbishops of Candia and Corfu, and the bishops of Chiozza, Torcello, and Caorle: yet his power is very inconsiderable, he having only the disposal of two benefices in the city of Venice, and being little regarded by the clergy out of it, who depend immediately on the senate.

The territories of the republic are under governors chosen out of the nobility, who are changed at the expiration of a certain term of years.

The annual revenue of the republic is computed at eight millions two hundred thousand Venetian ducats. In war time both the nobles and the other subjects, even the doge himself, contribute in proportion to their incomes towards defraying the expences of the state.

In the army the republic make little use of such of their subjects as live under heavy oppressions: the flower of the infantry consists of thirteen regiments of Dalmatians, men of great resolution, but more expert in the exercise of the sword than fire-arms. The Swifs, on occasion, furnish six thousand men, paid by the republic. If public accounts may be relied on, the whole army consists of twenty-eight thousand nine hundred seventy-seven men, over which is a field-marshal, or commander in chief, who is always some foreign general of distinguished reputation; but with him are joined two senators, without whose consent he can do nothing.

The naval force of the republic is said to consist of fourteen men of war, twenty galleasses, and twenty-five gallies, commanded by a captain-general, who is always one of the prime nobility.

The dominions of Venice consist of those in Italy, of a considerable part of Dalmatia, of four towns in Greece, and of the islands of Corfu, Pachsu, Antipachsu, Santa Maura, Curzolari, Val di Compare, Cephalonia, and Zante.

The Venetian territories in Italy contain the dutchy of Venice, the Paduanese, the peninsula of Rovigo, the Veronese, the territories of Vicenza and Brescia, the districts of Bergamo, Cremaſco, and the Marca Trevigiana, with part of the country of Friuli. We shall begin with the dutchy of Venice, the principal place in which is the city of the same name.

Venice, in Italian Venezia, and in Latin Venetia, the capital and seat of the republic, is situated in latitude forty-five degrees forty-six minutes, and in thirteen degrees ten minutes east longitude, and makes a very noble appearance at a distance, it seeming from its being built on a multitude of very small islands, to float on the sea, or rather, with its stately buildings and steeples, to rise out of it. The number of these islands still remains uncertain, some reckoning sixty, others seventy-two, and others again maintaining that they amount to one hundred and thirty-eight; but the latter must comprehend in the calculation all those places that have been gradually raised in the Laguna, by driving piles in the ground, and building on them.

The Laguna, or marshy lake, which lies between the city and the continent, is five Italian miles in breadth, and too shallow for large ships: by the attention of the republic it is prevented from becoming a part of the continent, and from being ever frozen so as to bear an army; hence the city is inaccessible on that side. Towards the sea the access is also difficult; but the safe and navigable parts are pointed out by piles, which at the approach of an enemy's fleet may be easily cut away. Besides, as a considerable number of men of war and gallies may be expeditiously fitted out for sea from the dock, which contains vast quantities of naval stores, the city is secure from any attack either by land or water, and is strong enough without fortifications. The fish, which are caught at the very doors of the houses, may be esteemed a good preservative against a famine, and the several canals lead-

ing to the city, between the sand banks and marshy shallows, are at a vast expence kept clear of the mud and slime brought with the flood. The return of the sea is something later here than every sixth hour, and it generally rises between four and five feet, keeping the water between the islands of the city in continual motion: but some of these canals being very narrow, the mud is not so effectually carried off as to prevent ill smells in hot weather.

The great canal, which winds in a serpentine form through the city, dividing it into two parts, is one thousand three hundred paces long. The best way of going up and down the city is in gondolas, which glide swiftly on these canals: but Mr. Keyser remarks, that as they are painted black, and lined with black cloth, or serge, they have a gloomy appearance; and the awning being so low that a person cannot stand upright in the gondola, when a stranger gets into one of them, it seems as if he was creeping into a hearse or tomb hung with black. The left side is always in these vehicles accounted the most honourable and eminent, because he who sits on the right must face the rower, who intercepts the view, and sometimes unavoidably splashes him.

Over the several canals are laid four hundred and fifty, and some say above five hundred bridges, great and small, most of them of stone: the highest and longest is the Rialto, which in the midst of the city crosses the great canal at its narrowest part, where it is but forty paces broad. This bridge consists of only one single arch, whose foundation takes up ninety feet, resting on twelve thousand elm piles. It is every where incrust-ed with marble, and is said to have cost the republic two hundred and fifty thousand ducats. In the upper part it is thirty-seven common paces broad, with two rows of shops, forming, as it were, three streets, of which that in the middle is the widest; and at each end is an ascent of fifty-six steps. The city may indeed be every where traversed on foot, but the streets are very narrow, and the pavement of free-stone very slippery in wet weather; and, at the same time, the many small bridges with their steps are not a little troublesome and dangerous, very few of the bridges having any fence on either side.

The city of Venice is about six Italian miles in circumference, and contains seventy parish churches besides others, fifty-four convents of monks, twenty-six nunneries, seventeen rich hospitals, eighteen oratories, forty religious fraternities with their chapels, fifty-three squares, one hundred and sixty-five marble, and twenty-three brass statues. The buildings are indeed all of stone, but the greater part make a very mean appearance; so that the city, in point of beauty and elegance, is inferior to many others. It is true St. Mark's square is very fine, as are also the several stately marble palaces that border upon the great canal, though most of them are of Gothic architecture. In the churches and convents the paintings are most admirable; for in these Venice surpasses even Rome itself. Here are also two academies of painting. The number of inhabitants has been computed at two hundred thousand. These inhabitants are the nobility and the citizens, after whom may be reckoned the lawyers, notaries, physicians, wealthy merchants, glass-makers, and all handicraftsmen, whether dwelling in the city or the more distant islands, together with the seafaring people and the gondoliers.

This city, from the fertility of the country in its neighbourhood, and the facility of carriage, enjoys a constant plenty of all kinds of provisions. The spring-water being very indifferent in most places, almost every house has a cistern, into which the rain water is conveyed from the roof, and clarified by being filtrated through sand. Water is also brought from the river Brenta, and preserved in the cisterns.

From this general sketch of the city, we shall now proceed to a particular description. It is divided into six large parts, of which the three first lie on the east and north side; and the three others to the west and south of the great canal, which, as we have already observed, divides the city into two principal parts.

The first named Sestieria St. Marco, particularly contains St. Mark's square, with the adjacent buildings. This square, which is the pride of the city, is on the

shortest side two hundred and forty paces long, and seventy-five broad, from the ducal palace southward of the canal Della Giudeca. The longest side runs in a direct line from east to west between the churches of St. Mark and St. Geminiano, near 180 feet. In the upper part, or at the first church, it is one hundred and twenty-six paces broad on both sides, exclusive of the piazzas; but in the lower part, or at the second church, only eighty-nine. The ducal palace, towards the water-side, and St. Mark's palace, are entirely Gothic; but on the side of the small canal and in the court, of tolerable good modern architecture, and is mostly of marble. This structure not only serves for the residence of the doge, but also for the meeting of the council. The finest ornaments in the council-chamber and other apartments, are the paintings of the great masters; particularly in the middle of the ceiling of the council-chamber, the republic of Venice is represented above the clouds, and surrounded with a multitude of gods, while the tritons and nereids, at Mercury's command, bring shells, coral, pearls, &c. and present them to her, as the queen of the sea. This is one of Tintoretto's best pieces; and in one of the apartments is another piece by the same master, in which Jupiter, with several other gods, conduct Venice, in order to lay the foundation of her power and grandeur in the Adriatic sea; in which the artist has imitated the ancient pagans, in giving the god such a glory round his head, as is usually painted round that of our Saviour. But the finest piece among all the paintings in this palace, is the taking of the fortress of Zara.

In the palace is also a small arsenal, where a considerable number of loaded muskets are always kept in readiness, that in case of an insurrection of the people, the doge and the nobility may make use of them for their defence; for this purpose the council-chamber has a communication through a door with the armoury, and every three months these pieces are fresh loaded. Among other curiosities in this arsenal are two little statues of Adam and Eve, cut with a knife in an uncommon kind of wood, by Albert Durer, during his confinement, for which he was rewarded with his liberty. Here is also a most curious lanthorn of rock crystal, for which a yearly pension of four hundred ducats was ordered to the inventor, and his heirs to the fourth generation. On the steps in the court of the palace stand two marble statues of Mars and Neptune. Towards St. Mark's church is also another of Francis Maria duke of Urbino, and at the church two others of Adam and Eve.

The lower gallery of the palace on the side opposite St. Mark's square, together with the hall under the New Procuratie, is called the Broglio. Here at a certain hour of the day the nobility walk, and no Venetian of an inferior rank must be seen there; though a foreigner, being supposed to be unacquainted with the custom, is not desired to quit the place. That part of St. Mark's square between the two buildings and the piazza receives an additional ornament from two pillars of oriental granite, on one of which stands St. Mark's lion in brass, and on the other a marble statue of St. Theodore. Between these is the place for the public execution of malefactors, through which no nobleman is seen to pass. A galley completely rigged and armed lies close to the Broglio, for the defence of the ducal palace, on any sudden emergency.

Contiguous to the north part of the doge's palace is St. Mark's church, which is also stiled the doge's chapel. Its materials justify intitle it to be called magnificent, it being both on the out and inside covered with fine marble: but the architecture is entirely Gothic. The best part of it are the Mosaic paintings, and the four horses of brass, which were formerly gilt, standing over the great door, and said to have been brought from Constantinople. These are universally allowed to be master-pieces. The treasury of the church is very rich in gold and jewels, and here is a famous manuscript of the Gospel of St. Mark; but the dampness of the place has spoiled it to such a degree, that it is so far from being legible, that it is not certain whether it be written in Latin or Greek. Before the church are two large masts fixed on brass pedestals, on which in festivals silken flags are hoisted.

Opposite

Opposite the ducal palace is a fine new building, called the Procuratie Nouove, which takes up an entire side of St. Mark's square. In it may be seen the public library and museum of antiquities. The former is only prized for the collection of Greek manuscripts left to the republic by cardinal Bessarion: but in the museum one cannot sufficiently admire the multitude of Greek and Roman marble statues, all highly finished. Adjoining the Procuratie Nouove is the Procuratie Vecchie, which takes up the other side of St. Mark's square as far as St. Geminiano's church. These buildings are called procuraties, from the procurators of St. Mark's church residing in them. Facing the angle formed by the New Procuratie stands an insulated square tower three hundred and eighteen feet high, and the ascent within is such that one may safely ride both up and down. On the spire at the top stands an angel of wood sixteen feet high, covered with gilt brass.

The principal churches in this division are those of St. Moses and St. Maria Zobenigo. Of the palaces by the great canal, one of the most stately is that of Pesaro. This quarter has a communication by a bridge with that of St. Paolo over the Rialto, and near it is the German-house, in which are mercantile goods consigned to or from Germany, and in it the Protestants perform divine service.

The next division, called Sestiere de Castello, contains the magnificent churches of St. Zaccaria, St. Giovanni e Paolo, with the neighbouring Dominican convents, the Scuola di St. Marco, the hospital li Mandicanti with its church, St. Giustina, St. Francesco della vigna, St. Pietro de Castello, called the patriarchate, and the ducal seminary. Here is also the celebrated arsenal, or dock, which is two Italian miles and a half in circuit, walled and moated, with twelve towers along its walls, and within the enclosure a great variety of buildings, in which every thing requisite for a land or sea armament is kept in readiness. These buildings consist of an armoury, store-houses for iron-work, oars, cordage, bullets, tar, hemp, canvas, guns, &c. A rope-house, a salt petre-house, smiths forges, a foundery, basons, and slips for building of ships and gallies. Within it lie the men of war, frigates, gallies, galleasses, and galliots. The workmen commonly amount to upwards of a thousand; they constantly live in the dock, and most of them were born there.

The third division of the city is named the Sestiere di Canale Regio, and has many churches, one of the finest of which is the Padri Gesuiti, or Jesuits. This structure has a superb front, adorned with a profusion of statues and fine columns, and the ornaments within this edifice are answerable to its outward beauty and elegance. The walls between the pillars, the great altar, and the pulpit, are of white marble inlaid with green, and embellished with flowers. The great altar has sixteen twisted columns of white and green marble. The steps and the pavement before it are of yellow and green marble, and resemble a beautiful carpet. The tabernacle is of lapis-lazuli. Among the multitude of other fine pictures with which this church is adorned, the most admired are the martyrdom of St. Lawrence, by Titian; the circumcision and ascension, by Tintoretto; the beheading of John the Baptist, by old Palma; and the Virgin Mary visiting her cousin Elizabeth, by Andrea Schiavone. The vestry is entirely painted by Palma.

In this division is also the theatre, and in this quarter live the Jews, who amount to about fifteen hundred, and are distinguished by their being obliged to wear a bit of red cloth on their hats.

The fourth division of the city contains nothing remarkable.

The fifth, called the Sestiere di St. Paolo, contains the exchange, the bank, the Franciscan church, the splendid chapel of St. Anthony, &c.

And the sixth, named the Sestiere di Dorso duro, has many magnificent churches, adorned with the most beautiful sculpture and paintings.

Round the city of Venice are a considerable number of small islands, some of which have handsome gardens, walks, and beautiful churches. One of the principal of these is St. Murano, a populous island about a mile from

Venice, and has its own magistrates, but, like the rest, is under the jurisdiction of the city. In it are fifteen churches, of which St. Peter's, the principal, belongs to the Dominicans. In this island the famous large looking-glasses are made, and other curious glass-work performed.

We have already mentioned many of the diversions of the city; and shall here add, that among the most rational and agreeable are the excellent concerts performed weekly in the churches of the hospitals de gl' Incurabili and della Pietà. In the former they are chiefly vocal, and in the latter instrumental; and, what is most extraordinary, the performers in both are poor maidens.

The trade of Venice in cloth, especially scarlet, silk stuffs, and looking-glasses, is still very considerable. Here are also manufactured gold and silver stuffs, for which they have a good vent in the Levant; and likewise brocatellas, a kind of stuff like brocade, made of coarse silk, and much used for carpets.

Having given a very particular account of the republic, we shall proceed to give a description of the several countries subject to it.

S E C T. XI.

The PADUANO, or PADUAN.

Its Situation and Extent, with a particular Description of the City of Padua, and a concise Account of Abano and Rovigo.

THE Paduan, or territory of Padua, is called by the Italians Paduano, and is a part of Lombardy: it is bounded on the north by Trevisano, on the east by the Dogado, on the south by the Polesino, and on the west by the Veronese and Vicentino; it extending about forty miles in length, and thirty-five in breadth.

This is one of the most fertile spots in Italy; and the country is adorned with a great number of beautiful villas and gardens: but it is subject to storms, particularly those that come from the sea, which are extremely violent.

Padua, in Latin Patavium, is an antient and large city on the Brenta, situated in the forty-fifth degree thirty-six minutes north latitude, and in the twelfth degree twenty minutes east longitude. The inhabitants boast that the republic of Venice owes its origin and rise to their city; but it is now some centuries since Padua has been brought under the Venetian yoke, which has occasioned it greatly to decline from its former splendor; so that at present it scarcely contains forty thousand inhabitants. The streets are narrow, ill paved, and dirty; but almost all the houses stand upon porticos, under which one may walk without being incommoded either by the sun or rain: this, however, renders the lower part of the buildings dark. The city contains twenty-six parish-churches, twenty-three convents of monks, eighteen nunneries, four good hospitals, and is a bishop's see.

The principal church is that of the Franciscans, dedicated to St. Anthony, on account of the excessive veneration paid by the Paduans to this supposed saint. It is built upon the ruins of a temple of Juno, and is very spacious, full of gold, silver, precious stones, paintings, gildings, sculpture, and every other kind of magnificence. The pavement is of marble of various colours; the choir is adorned with white and red marble, and the benches, which are very fine, are embellished over head with bass reliefs in eighteen brass pannels, by Sansovin, representing several passages of the life of Christ, and are very much admired: but the richest part of this church is the chapel, which contains his body, and is entirely lined with white marble. "In the chapel of this saint, says Keyser, I saw burning above fifty large silver lamps, and one of gold; together with two very large silver candlesticks standing on pedestals of white marble. St. Anthony's coffin is of serpentine, and lies under the altar, which is adorned with seven angels of bronze, and some exquisite sculpture; and, indeed, the chapel has in every respect but few equals. On one side of it are shewn two wax flambeaux, eight or nine inches in diameter,

“ diameter, and fixed in iron-work. These are said to
 “ have been offered by a treacherous Turk, with a de-
 “ sign to blow up the chapel, by means of fire-works
 “ concealed in them; but it seems St. Anthony prevent-
 “ ed the calamity; for these flambeaux being lighted,
 “ he cried out aloud three times from his coffin, that
 “ they should be put out, which occasioned a farther
 “ examination of the flambeaux, and thus the villainous
 “ plot was discovered. St. Anthony’s remains are said
 “ continually to emit a most fragrant perfume, which
 “ is chiefly smelt at a crevice behind the altar; and it
 “ is said that this perfume is stronger in the morning
 “ than in the evening, whence some have inferred that
 “ the cleft is rubbed with perfumes every morning, be-
 “ fore the people are permitted to approach it. The
 “ saint’s tongue is kept with great devotion in a glass
 “ vase in the vestry, and very fervent prayers are offered
 “ up to it.”

The church of St. Justina, designed by Palladio, be-
 longs to the Benedictine convent, which is said to be
 possessed of an annual income of a hundred thousand
 ducats, and is remarkable for being a handsome, lumi-
 nous, and disencumbered building; and is esteemed by
 many artists one of the finest works in Italy. The long
 nave consists of a row of five cupolas, and the cross one
 has on each side a single cupola, deeper and broader than
 the others. The martyrdom of St. Justina, done by Paul
 Veronese, hangs over the altar. The chief relics of this
 church are the supposed bodies of St. Luke and St.
 Matthias.

The magnificence of the convent, which is built of
 large square free-stone, is answerable to the beauty of
 the church: it is a vast fabric that has six cloisters, several
 courts, and many gardens. The refectory is very fine,
 extremely neat, and adorned with an excellent picture of
 Jesus at Emmaus, by Titian: they also highly value a
 statue of the Virgin Mary here, which they say was at
 Constantinople when the Turks made themselves masters
 of that city; but was so frightened by those barbarians,
 that she flew directly to Padua.

What they call the library is a very magnificent build-
 ing, but very ill furnished with books, the cellars being
 much better stocked with hogheads of wine. The Bene-
 dictines of St. Justina boast of having discovered in their
 garden the coffin of Titus Livius, and that this convent
 is built upon the ruins of an old temple of Concord,
 some say of Jupiter.

The square near it is the largest in Padua, and was
 antiently called the Field of Mars: its present name is
 Prato della Valle, and it serves for the quality to walk
 in. There is a small spot in this square named Campo
 Santo, or the Holy Field, from the great number of
 Christians who formerly suffered martyrdom there. The
 cathedral is a very old structure, and has a revenue of a
 hundred thousand crowns for maintaining twenty-seven
 canons, who must be all of noble extraction, with some
 chaplains and other officers. There are here the tombs
 of many great men, and the church is adorned with a
 great number of excellent paintings by the great masters.
 Other handsome churches are those of the Carmelites,
 St. Francisco di Paola, the Theatines, and St. Maria
 della Gratie.

The university founded by the emperor Frederic II. was
 formerly in great repute; but has for many years been
 so decayed, that the students now scarce make five
 hundred. No difficulty is made of burying a Protestant
 traveller in a church or convent, if before his death care
 has been taken to have his name entered in the matri-
 cula of the university. In this structure are the statues
 and arms of a great number of illustrious persons who
 were members of it. The anatomical theatre being
 somewhat dark, the dissections are generally performed by
 candle-light. The library is a handsome building, and
 the physic-garden, though not large, is ingeniously con-
 trived, and was the first of the kind belonging to any
 university in Europe.

The chief civil edifice is the town-house; but its large
 hall is kept in so dirty a condition, that were it not for
 some monuments it contains it would not be worth see-
 ing: on the outside of the four gates are the statues of
 four celebrated Paduans, namely Titus Livius, Albertus

Patavinus, Petrus Aponus, and Paulus Patavinus. In
 the large hall just mentioned is a stone, which has a Latin
 inscription, by which it is termed the stone of ignominy
 and bankruptcy. For such as became bankrupt, and
 were unable to pay their debts, by sitting publicly three
 times with their bare posteriors on this stone, and swear-
 ing that it was not in their power to discharge their debts,
 were cleared from any farther prosecution from their
 creditors: but this extraordinary ceremony has been dis-
 continued for upwards of sixty years.

The podesta, or chief magistrate’s palace, which joins
 to the town-house, contains a great number of bustoes,
 statues, and arms of former podestas; and in it is also the
 city library.

The pallazzo del Capitaneo stands in a beautiful area
 called Piazza de Nobili. It is an elegant building, and
 the second story is adorned with a gallery, supported by
 seventy-three columns of red marble. The tower is also
 a good piece of architecture, and has a clock which shews
 both the course of the sun and moon.

The antient palace of the tyrant Acciolini is remarkable
 for its spacious vaults, and at present serves both for
 an arsenal and granary: it has two towers, on one of
 which is a Latin inscription to the following purpose:

“ Shed tears of compassion on this prison, where the
 “ blood of your ancestors was abundantly shed; for those
 “ whom the inhuman Acciolini thrust down alive,
 “ without any distinction of age, sex, rank, or con-
 “ dition, into this dungeon, perished with hunger, grief,
 “ and despair. After such numbers of innocent victims,
 “ who were buried alive in this dreadful sepulchre, it was
 “ at last the just fate of the execrable tyrant himself to
 “ expire in it. Hence you ought to be sensible of your
 “ present happiness, in having a prince who, from being
 “ objects of pity and compassion, has rendered you so
 “ happy as to be envied for your prosperity. This in-
 “ scription was placed over this dreadful dungeon by Se-
 “ bastiano Galvani, a native of Padua, commissary of
 “ the provisions and military-stores lodged in this castle,
 “ in the year 1618.”

Among the pleasure-gardens in Padua that of d’Andola,
 a noble Venetian, is one of the best, it being adorned
 with great numbers of statues; but the Papafava gardens
 exceed it for orange-trees, cypress, and other evergreens,
 which are disposed into fine walks, labyrinths, and beau-
 tiful hedges. Of the latter some are of box-trees thir-
 teen or fourteen feet high.

Though the air of Padua is esteemed very healthy, yet
 few cities have so many apothecaries in proportion to the
 number of the inhabitants: but it must be observed, that
 most of these venders of medicines are also confectioners.
 Great quantities of vipers are collected here, some of
 which are kept alive for various uses, and others dried
 and made into powder, which is supposed to be of great
 efficacy in medicine.

The Jews have their particular quarter allotted to
 them at Padua, out of which they are not permitted to
 stir.

The plain about Padua is a perfect paradise, and the
 neighbouring mountains yield excellent wine and oil.
 The passage from Padua to Venice is very convenient,
 and in fair weather the sight of the many seats on both
 sides the river renders it very pleasant.

At the distance of about four Italian miles from Pa-
 dua is the village of Abano, which is much frequented
 in summer on account of the warm baths, which are a-
 bout half a mile from it. In these baths are three sorts
 of water of very different qualities; some of these springs
 are impregnated with sulphur, and have particular bath-
 ing-rooms, where, by means of steps, one may descend
 to any depth in the water: others are boiling hot, and
 the water springs up in such quantities as to drive a mill
 at the distance of about twenty paces from the source.
 The wooden pipes through which the water is conveyed
 to these baths are often encrusted with a white stoney
 substance, not easily separated from the wood; and the
 exact impression of the veins and knots of the wood on
 this concretion make it perfectly resemble petrified wood.
 A sudatorium has also been built here, the effect of which
 is caused by the steam of the water. Some of the springs,
 which are tepid, are said to be impregnated with lead,

and others, from their reddish sediment, and other signs, appear to be chalybeate. In those where sulphur predominates, the pipes contract a crust of whitish salt. Here is also a mud-bath, where very obstinate arthritic disorders have been cured, by means of the warm mud.

The peninsula Rovigo, which is also subject to Venice, is very fertile, and environed by the rivers Adige, Po, Tattaro, and Castagnaro; and is intersected by several canals. It contains Rovigo, a pretty large city seated on the Adige, which runs through it. Its fortifications are antient, besides which it has a castle, and is the residence of the bishop of Adria. This district, besides the above city, only contains Adria, which is now an inconsiderable place, and three other market-towns.

S E C T. XII.

The V E R O N E S E.

Its Situation, Extent, and Produce; with a particular Description of the City of Verona.

THE Veronese, the next country subject to Venice, is bounded on the north by the country of Trent, on the east by the Paduan and Vicentino, on the south by the duchy of Mantua, and on the west by Bresciano. Its utmost extent from north to south is about forty miles, and its breadth from east to west about thirty-two.

The Veronese is a delightful country, abounding in excellent peaches, melons, figs, strawberries, truffles, very large artichokes, chestnuts, apples, pears, plums, wine, oil, corn, and other vegetables. It has good marble, and petrifications of several kinds. Among the mountains, that of Baldo is celebrated for its valuable plants. The lake of Garda, in Latin Benacus, Virgil represents as very stormy, comparing its waves to those of the ocean: indeed it resembles the sea, and his description is not very hyperbolical. It is upwards of twenty-eight English miles in length, and abounds in fish, particularly large fine trouts. The district of Verona annually brings in to the republic of Venice upwards of five hundred and sixty thousand ducats. The principal city of this district is the following:

Verona, the capital of the Veronese, is a very large city, situated in the forty-fifth degree twenty-six minutes north latitude, and in the eleventh degree fifteen minutes east longitude. It is fortified in the antient manner, with three castles, two of which stand on a hill, and the other two in a plain, by the river Adige, which runs through the city, and over which are four stone bridges, one of them three hundred and forty-eight feet long.

This city makes a better appearance from its delightful outlets, than when one is within it; most of the streets being narrow, crooked, and dirty, and the houses but mean. The inhabitants are computed to amount to near fifty thousand, but they were formerly much more numerous. The best street in the city is called Il Curso, where the diversions of the carnival conclude with foot-races, &c. Common prostitutes were formerly permitted to enter the lists, and to run for the prize; but this custom has been abolished, and altered to a horse-race, which is exhibited on Shrove-Sunday, the last Sunday of the carnival. The prize is a piece of gold brocade, or some other rich stuff. The largest piazza in this city is La Piazza d'Armi, where the two annual fairs in spring and autumn are held, and in which stands a marble statue representing the republic of Venice in a female habit, with a crown on her head. In the town-house are the statues of five celebrated persons who were natives of Verona; these are Catullus, Æmilius Marcus, Cornelius Nepos, the elder Pliny, and Vitruvius; besides which, on a high arch, stands the statue of Geronimo Fracastori, a learned physician, mathematician, and excellent poet, who flourished in the sixteenth century. The most valuable piece of antiquity here is the celebrated Roman amphitheatre, which is so perfect that the seats on which the people sat are still entire. Indeed but little of it appears antient, it having been carefully repaired from time to time at the city's expence. The learned count Maffei computed that it conveniently held twenty-two thousand one hundred and eighty-four spec-

tators, but the outer wall and the upper story are wanting.

In the edifice where the learned Philharmonic Society hold their meetings is a very large hall, in which are the portraits of the *patres*, or presidents of this academy, who are always four in number; and in an apartment on the left hand are kept the old musical instruments with which the nobility of Verona used formerly to amuse themselves. An apartment on the right hand is appointed for the presidents of the Philoti, who are instituted for the improvement of bodily exercises, as riding, fencing, vaulting, dancing, &c. There is also in this building a fine theatre for exhibiting operas and comedies, which has five galleries, and was built from a design of the famous Francesco Bibiena, architect to the emperor. As the nobility assemble here several times in a week to divert themselves with cards, &c. this theatre may be considered as a kind of exchange for the polite and the literati of Verona. In one room stands the statue of a female of white marble. On the outside of this edifice are to be seen a great number of inscriptions and other remains of antiquity, many of which were dug up about Verona; and that they may not be exposed to any future damage from the injuries of the weather, they are inserted in a long wall facing the south, the north wind being found very detrimental to stones. After these are several antient monuments in basso relievo, representing the gods, sacrifices, &c. In the proper arrangement of these pieces the marquis Scipio Maffei was at no small expence, and spared no pains to increase their number; on which account the gentlemen belonging to this academy erected a marble statue of him over the entrance of this building.

In Verona there are convents of Carmelite monks, both bare-footed and others. In the church of the former are three fine altars, the first of which is adorned with columns of verde-antico, the second with pillars of a red and white veined marble, and the third with columns of a yellow marble. The high altar is also of beautiful marble finely executed, and adorned with a noble picture of the Annunciation.

In the church belonging to the other Carmelite monks is a beautiful altar of fine marble, and in the vestry a fine piece of painting by one of the disciples of the celebrated Raphael, representing our Saviour when a child playing with John the Baptist, and the Virgin Mary looking with great complacency on their mutual fondness and sportive innocence.

Among the other churches, one of the finest is that of St. George, belonging to the Benedictine monks. Over the door is the baptism of Christ painted by Tintoretto; on the high altar is a piece representing the martyrdom of St. George, by Paul Veronese; and on one side near it our Saviour feeding five thousand people, by Paul Taranati, who was seventy-nine years of age when he painted this piece; and on the other side a very fine representation of the Israelites gathering manna. This piece is twenty-four feet in length, and twenty-three broad.

Between Verona and Vicenza are found all kinds of petrified fish, most of which are of the salt-water species, in a sort of white loam. These fishes are generally well preserved, their bones being entire, and frequently even their scales; they chiefly consist of pike, soles, thornbacks, flying-fish, perch, and gudgeons.

S E C T. XIII.

The Territory of VICENZA, or VICENTINO.

Its Situation, Extent, and Produce; with a particular Description of the City of Vicenza, and the Manners of the Inhabitants.

THE territory of Vicenza is also a part of Lombardy, and is bounded on the north by the territory of Trent, on the east by the Trevisano, on the south by the Paduan; and on the west by the Veronese, extending in length from north to south, about forty miles, and in breadth about thirty-three.

The air is serene and healthful, and the inhabitants computed at a hundred and fifty or a hundred and sixty thousand souls. The country is indeed so fertile and de-

lightful,

lightful, that it may be called both the garden and flesh-market of Venice; it also produces good wine.

The principal city in this territory is Vicenza, or Vicentia, which is situated thirty Italian miles from Verona, in the forty-fifth degree thirty four minutes north latitude, and in the twelfth degree fifteen minutes east longitude, and is watered by the rivers Bachiglioni and Rerone, which here unite their streams, and contains many elegant and beautiful buildings, the tops of several of them ornamented with statues, particularly the piazza before the council-house. This piazza makes a grand appearance, and before it stands two very lofty columns: on the top of one of them is St. Mark's winged lion, the arms of Venice, and on the other the image of our Saviour. There is in this city a literary society styled the *Olympici*, whose design is chiefly the improvement of the Italian language. The academicians hold their meetings in a theatre built by the celebrated Palladio, who was a native of this city. It is but seldom used as a theatre, yet the perspective of the stage is admirable, and it is adorned with statues of the Roman emperors and philosophers. The pit is likewise adorned with several statues, and the seats are disposed after the manner of the antient amphitheatres. In the Campus Martius, without the city, is a triumphal arch built from one of Palladio's designs, in imitation of the antient structures of that kind. The Monte della Pietà is also a stately fabric, and has a very fine library.

Of the churches, which are fifty-seven in number, fourteen are parochial, and twenty-nine conventual. Among these the great altar of the Dominican church is a superb piece of Palladio's architecture.

The church della Madona di Monte, on a mountain without the city, is much frequented by pilgrims, and has a fine frontispiece, with a convent built close by it. In the refectory of this convent is a picture painted by Paul Veronese, representing pope Gregory the Great sitting with several pilgrims at table, where our Saviour is also present. Though this piece be finely executed, the design is very absurd. The pope sits at the upper end, without his triple crown; and next to him Christ is represented without any particular mark of distinction: the next is a cardinal, and on the other side another cardinal, with a large pair of spectacles on his nose; a page dressed in the Spanish manner waits at table, with a dog under his arm: under the table are represented a cat, a monkey, &c. The mountain on which this church and convent are built yields a very agreeable prospect, which extends as far as Padua. For the convenience of the usual processions, and of pilgrims, a large ascent by steps has been made up the acclivity of the mountain. In the valley at the beginning of the ascent is a triumphal arch, and on the left hand of it is a statue of the Virgin Mary.

The finest garden at Vicenza is that of count Valmarano, which for its situation, vistas, arbours, and beautiful walks, may be esteemed one of the noblest in all Italy. A covered walk of cedar and orange-trees, planted alternately, and above two hundred paces in length, is particularly admired. On one side of it is a broad canal, well stocked with large barbels and other fish, which at the sound of a pipe immediately appear in great numbers on the surface, in order to be fed. Over the entrance into the garden is a Latin inscription to the following purpose:

"If corroding cares have haply followed thee thus far, though they be loth to leave thee, dispel and banish them, for this place is dedicated to genial mirth and festivity. Whoever shall damage these cedars, or crop a flower, let him be esteemed sacrilegious, and be punished, to appease Vertumnus and Pomona, to whom they are consecrated.

"Native, friend, or stranger, who desirest to amuse thyself with the rural charms of this place, thou mayest securely enter these gardens designed for pleasure and recreation. Here is no fierce dog, no frightful dragon, no deity with threatening weapon; but every thing is here freely, and without danger, exposed to thy view. Such is the pleasure of count Leonardo Valmarano, the owner of these gardens, who relies on thy

"modesty and good breeding as sufficient to guard the place from outrages."

The inhabitants of Vicenza have the character of being more vindictive than the rest of the Italians; and it is certain that travellers, especially those who are hot and quarrelsome, should be very careful both here and in every part of Italy to avoid disputes, especially with the postillions and other persons of the lower class; for the desire of revenge is so predominant, that they have been known to follow a traveller six or eight stages to watch an opportunity of gratifying their malice. "Open violence, says Mr. Keyser, from whom we have borrowed these remarks, is little to be apprehended from them, on which account the danger is the greater; for cowards are always cruel. Murder is looked upon in Italy in a very different light from what it is in other countries. If a robbery is committed in the streets, or market-place, in any of the towns of this country, and the people are called to stop the thief, there is always assistance at hand to pursue the criminal; but upon crying after a murderer, nobody offers to stir, and the assassin saves himself by flying unmolested to a church, convent, or other asylum, where, to the great honour of the clergy be it spoken, the villain receives all possible assistance, that he may escape the hands of the civil power. I remember a postillion, the above author adds, who once drove me, was treacherously stabbed at the post-house of Pistoia; and though the fact was committed in the presence of more than ten persons, not one of them stirred a foot to seize or pursue the murderer."

The meanest citizens of Vicenza, in signing contracts or other deeds, add to their names the title of count of Vicenza; an empty piece of pride, which they are said to derive from an answer given by Charles V. who when he was at Vicenza, to get rid of the importunate solicitations of several wealthy citizens to grant them the title of counts, said in jest, *Todos condes*, "I make you all counts."

SECT. XIV.

Of the Territories of Bresciano, or Brescia, Bergamo, Cremasco, Marca Trevigiana, Friuli, and Istria: with a Description of the Cities of Brescia, Bergamo, Crema, Treviso, or Trevigio, and Udine.

THE territory of Brescia is also a part of Lombardy subject to the Venetians, and, though mountainous, abounds in wine, oil, wheat, and other grain; also in silver, copper, iron, and marble of all colours. This territory is bounded on the east by the Lago di Garda; on the westward by the Lago d'Iseo, in Latin *Sevinus*; and on the southward by the small lake of Idro. The principal city in this district is the following:

Brescia, in Latin *Brixia*, is a fortified city on the little river Garza, in the forty-fifth degree twenty-seven minutes north latitude, and in the tenth degree thirty-nine minutes east longitude, and is defended by a castle seated on a hill. Besides the cathedral it has nineteen parish-churches, forty-five convents, and some charitable foundations, with a general hospital. Its bishop is a suffragan to the archbishop of Milan; he has large revenues, and bears the titles of duke, marquis, and count. The cathedral is a stately modern structure; and the celebrated bishop cardinal Quirini having greatly contributed towards the building of it, and made the city a present of a library, the magistracy, in 1750, erected two statues of him, one in the church, and the other at the entrance of the library; and also caused a medal to be struck to his honour. Among the relics of this church is an azure cross, believed to be the same which Constantine saw in the air. The inhabitants are computed at near fifty thousand, and the nobility live here in a very splendid and gay manner. The fire-arms, swords, and cutlery-ware of this city are much esteemed, as are its linen-manufacture, which, with other commodities, render its trade very considerable.

In this territory are some other towns, and a considerable number of villages.

The district of Bergamo is also a part of Lombardy : towards the north it is mountainous and rocky, but about the capital very fruitful. Some valleys produce wine and oil, while others are barren, but abound in iron. The only considerable place in this district is

Bergamo, a well fortified city on several hills, at the bottom of which are some handsome suburbs. Between the city and a strong castle which stands on the highest mountain, is a communication under ground. In the cathedral, which is a handsome structure, are said to be preserved and venerated with great devotion the bodies of twenty-five saints. The bishop is suffragan to the archbishop of Milan. This city is famed for its sewing silk, and has a fair on St. Bartholomew's day, to which there is a great resort of merchants and tradesmen from Italy, Germany, and Sicily.

The district of Cremasco, which is also a part of Lombardy, is very fruitful in corn, wine, and hemp, and contains

Crema, a pretty strong city, seated in a very fruitful plain, on the river Serio, and defended by a castle. The bishop is subordinate to the archbishop of Bologna. The houses are elegantly built, and besides the cathedral there are thirty churches, convents, hospitals, and charitable foundations.

The Marca Trevigiana is one of the richest and best spots in all Italy ; particularly the country between Treviso and Castel Franco is, as it were, one continued garden, every where planted with rows of wild mulberry trees, which serve as espaliers for vines ; and in travelling from Treviso to Maestre in the dutchy of Venice, each side is most charmingly variegated with the beautiful villas and gardens.

The principal place in this territory is Treviso, or Trévigo, a very old fortified town, with a fort on the river Sile, into which, after dividing itself into three branches, and watering the town, the Piavesella discharges itself. This place is of a middling size, with many neat houses, and among its inhabitants are several noble families. In 1608, the academy Perseveranti was erected here. It has also the academy of Solleciti. It is the residence of a bishop, and became subject to the republic in 1388.

The fertile country of Friuli anciently belonged to the patriarch of Aquileia ; but in the fifteenth century became subject to the republic of Venice. In the sixteenth century a part of it devolved to the house of Austria.

The capital of the Venetian part is Udine, a city of middling size, seated on the river and canal of la Roia. The patriarch, who formerly resided at Aquileia, some years ago took up his abode here. The contest between the house of Austria and the republic about the patriarchate, was compromised by the pope's suppressing the patriarchate, and erecting two archbishoprics out of it, one to be in the city, and the other in that of Gorizia, which belongs to Austria. The archbishop of Udine is metropolitan of all the bishops in the Venetian territories that were before under the patriarch. This city contains several churches, convents, and hospitals ; a college for law, and an academy for martial exercises.

Istria is a kind of peninsula between two large bays of the gulph of Venice, namely that of Trieste and that of Quarner, and is about sixty miles in length, but not near so broad. It was a part of the ancient Illyricum ; but being conquered by the Romans, between the first and second Punic wars, was annexed to Italy. In the middle ages it belonged to the patriarchate of Aquileia, who was invested with it as a marquisate by the emperor Henry IV. In 1190, most of the maritime part was conquered by the republic of Venice, which they have ever since enjoyed, though not without some interruption from the Austrians. It is fruitful, especially in wine and oil, but is hilly, and the air unhealthy, on which account it is but thinly peopled.

Capo d'Istria, anciently Justinopolis, the capital of the territory, is a bishop's see and a pretty strong town, seated on a small island, so near the continent that it is joined to it by a bridge. The cathedral is an old, but a

stately building, and has three aisles supported by eighteen marble pillars. The churches of the Servitæ and Dominicans are noble structures, as is also that of the Franciscans, who hold the tribunal of the inquisition. The town-hall is a very ancient edifice, supposed to have been formerly a temple dedicated to Pallas ; and it is even affirmed, that the statue of Justice, which now stands in the front of the building, was that of the goddess.

In this district are several other towns ; but they are most of them small and inconsiderable.

With respect to the other parts of the dominions of Venice, we have already given an account of Venetian Dalmatia in page 136 ; and of the islands of Corfu, Santa Maura, Cephalonia and Zante, which belong to Venice, in treating of Turkey in Europe, page 26, 27.

S E C T. XV.

Of the Republic of GENOA.

The Situation, Extent, and Produce of Genoa. Its Manufactures, Trade, History, and Form of Government. The Title and Arms of the Republic : Its Offices, Courts, Revenues, Military and Naval Force ; with a particular Description of the City of Genoa, and of the Manners of its Inhabitants.

THE independent republic of Genoa, besides being possessed of a long tract which extends along the coast of an extensive gulph of the Mediterranean, anciently called Mare Ligusticum, has also the sovereignty of the island of Corsica. The above tract extends along the coast from east to west, about one hundred and fifty-two miles ; but from north to south it is very narrow in some places, it being only eight, and in the widest not above twenty miles broad. It is bounded by the principality of Piedmont, the duchies of Montserrat, Milan, Placentia, and Parma, the grand dutchy of Tuscany, and the republic of Lucca.

The mountains take up a great part of the country ; some of these are covered with woods ; some are quite barren and rocky, and others yield good pasture. Though the Genoese, from their want of arable land, are obliged to furnish themselves with great quantities of corn from Lombardy, Sicily, Naples, and other countries, yet such is their skill and industry in improving a mountainous, rocky, and sterile soil, that all the year round Genoa is plentifully furnished with pulse and vegetables for the kitchen in the highest perfection. The country also produces both common and muscadell wine, with plenty of excellent fruit, particularly in the west part are lemons, oranges, pomegranates, figs and almonds ; besides many plantations of mulberry-trees, chiefly intended for silk-worms. The olives principally grow about Spatia-bay. It will not here be improper to observe, that the olive-tree very nearly resembles a willow, and makes but a mean appearance. The best oil is the white and transparent ; for the deep yellow is either made from over-ripe olives, or has been kept too long. The good oil has no smell nor any kind of viscid fatness. Virgin oil, by the ancients called green oil, is pressed both from ripe and unripe olives, and is the whitest, the most palatable, and in every respect the best. The inhabitants have also such plenty of salt, that they can spare it for exportation, as they also can stone and marble. These territories are watered by many rivers ; but they are all of them small and inconsiderable.

The inhabitants of Genoa are of the Romish religion, and the inquisition, as in other parts of Italy, has been introduced here. However, a great number of Protestants live among them without molestation.

The Genoese manufactures are far from being so numerous as formerly, yet velvet, plush, and fustian, are still made, together with damasks, and other silk stuffs ; for which considerable quantities of red silk are imported from Messina and other ports of Sicily ; they also make gold and silver tissues, laces, and gloves ; but these are inferior to those of France and the Netherlands. The other Genoese merchandizes consist of oil, fruit, Parmesan cheese, anchovies and drugs, which last are brought

brought from the Levant. A brisk trade is carried on with these goods, especially to Spain. Ships of most European nations, particularly English, Dutch, and French, are constantly seen at Genoa, which is also the great mart for the trade of Lombardy. Indeed the revenues principally arise from manufactures and trade; but the state is far from making the figure it formerly did, which is chiefly owing to the improvement of manufactures in other countries, the dearness of the Genoese goods, and the danger of the harbour. Indeed Genoa was in 1751 declared a free port; but this freedom is under some restrictions not known at Leghorn. In the part properly called Porto Franco, any merchant may have a warehouse, and both export and import goods free from duty; but such as are disposed of in the city or on the continent, pay very considerably. The city of Genoa is famous for having the richest bankers in Europe, and hence a very profitable article is its dealing in bills of exchange.

Genoa was the capital of ancient Liguria; it was destroyed by Mago the Carthaginian, but rebuilt by the Romans, and after them fell under the power of the Ostrogoths, out of whose hands it was rescued by the great Belisarius, and rendered subject to the Eastern empire. In 670 it was sacked by the Longobardi; but being afterwards rebuilt, continued under their dominion till they were expelled out of Italy by Charlemagne.

For some centuries Genoa was subject to the Roman emperors, but by degrees erected itself into an independent state; and soon after its power became so increased by its flourishing trade, that in the year 806 it reduced the island of Corsica; and in the eleventh and twelfth centuries the inhabitants distinguished themselves in the croisades. The Genoese in the twelfth century subdued half of Sardinia, and the city of Syracuse in Sicily, and even made themselves masters of all the ports in the Black Sea, and settled themselves in Crimea. In the thirteenth century they added to their conquests the towns of Albenga, Savona, Vintimiglia, and others in their neighbourhood, and engaged in a long and expensive war with Venice, which lasted till the year 1381, and so weakened them, that they became unable to maintain the possession of Crimea, from which they were entirely driven in 1471. At length this republic suffered many rude shocks from the intestine dissensions which arose about the form of government, by which the state was so debilitated, that the people were obliged to put themselves sometimes under the protection of the duke of Milan, and sometimes under that of the kings of France; but the latter treating them with intolerable rigour, they struggled hard for liberty, but without success, till that naval hero Andrew Doria, in 1528, rescued his country out of the hands of the French, and established its present form of government. Genoa has from that time generally sided with Spain, which has frequently involved it in quarrels with France, and it has always had a dangerous neighbour in the duke of Savoy. In 1684, the capital was bombarded by the French, when the republic, to save it from total destruction, was obliged to submit to very hard terms; two of which were, That the doge and four counsellors should appear in person at Versailles, and ask pardon; and that the state should disarm all their galleys, except six, and fit out no more without the French king's consent.

In the year 1713, Charles VI. sold the marquisate of Final to the republic for a considerable sum of money; and in 1730, the inhabitants of Corsica began their revolt, and will probably be never entirely reduced under the Genoese subjection. In 1743, the queen of Hungary having at the treaty of Worms, ceded to the king of Sardinia all her right to the town and marquisate of Final, and he demanding that the Genoese should deliver them up, they entered into an alliance with France, Spain, and Naples, and in 1745, declared war against the king of Sardinia; an unfortunate step, for which they were severely chastised in 1746, by Great Britain and the queen of Hungary. The king of Sardinia made himself master of all the Riviera di Ponente; several Genoese ports were bombarded by the English fleet, and the Imperialists even seized on the city of Genoa; but after a terrible slaughter on both sides, were

driven out by the inhabitants, and in 1747, failed in their attempt to recover it. However, the tranquility of this republic was restored by the treaty of Aix-la-Chapelle in 1748.

Before we describe the form of government, it will be proper to give our readers some idea of the nobility, which are distinguished into ancient and new. The ancient nobility consists of twenty eight families, whom Andrew Doria, in the year 1528, declared alone capable of holding the dignity of doge, and the other chief offices; all the other inhabitants being reduced by him to the class of commoners. However, there are joined to these other eminent and wealthy families; but they are obliged instead of their former name to adopt one of the twenty-eight; for in subsequent times it was found necessary, for the preservation of the public tranquillity, to proceed to a new creation of nobles. The new nobility consist of about five hundred families. The ancient nobility think themselves much superior to the modern, though both are now equally capable of public employments. However, in order to sit in the great council, it is necessary to have been a nobleman four years, and six to sit in the lesser; but a procurator or senator must be a nobleman of ten years standing, and to be doge requires fifteen. The great families of Doria and Spinola have given over commerce, but the other nobility make no scruple of being wholesale merchants. They are also allowed to keep velvet, silk, and cloth manufactories; to farm the duties, and to have shares in merchant-ships; but all other business and handicraft employments are forbidden them. It may be said in general, that the republic is poor, and the nobility rich, though not to such a degree as is commonly supposed. Dr. Busching says, he is credibly informed, that not above four or five houses are possessed of three hundred thousand liri per annum, (each liri is worth about eight-pence three-farthings sterling) that there are many more from twenty to thirty thousand; but the greatest part of them have not above ten thousand.

The form of government in this republic is aristocratical; the chief person is called the doge, or duke, to which dignity no person is promoted till he is fifty years of age. Every two years a new doge is chosen, and the former is incapable during five years of holding the same post again. However, he has a procurator's office assigned him, and a pension of a hundred scudi for life, each worth four shillings and six-pence.

On the election-day, which is usually on the third of January, the great council meet in the ducal palace, and by drawing gilt balls out of a box, where are also some silver ones, fifty persons are chosen out of the lesser council, who write down the names of such as they think worthy of being promoted to the ducal office. From these so nominated, and also from the fifty who drew the gilt balls, the great council, by a majority of votes, select fifteen; and of these again the lesser six, of which each at least must have three-fifths of the votes. It is out of these six that the great council, by a majority of suffrages, elect a doge.

On account of the kingdom of Corsica a crown is placed on the doge's head, and a sceptre in his hand; and during the two first days after his election, he wears royal robes; but afterwards only the scarlet gown common to all the members of the council. He is styled his serenity, but at the expiration of his government he is only styled his excellence, like the rest of the council. He and his family live in the palace, and have a body-guard of two hundred Germans. Without his consent nothing can be proposed, nor any resolution of the council be of force. In all important affairs he makes the first motion, gives audience to ambassadors, and all orders are issued in his name.

The title of the republic is, the most serene republic of Genoa. Its arms are argent, a cross gules; the helmet surmounted with a regal crown, to denote the sovereignty of the republic over the island of Corsica. Its rank is immediately next to Venice, and it requires that its ministers at foreign courts should be treated as those of crowned heads.

The chief authority, next to that of the doge, is lodged in the two colleges of the Governatori and Procuratori,

tori, who may also be considered as the council appointed by the doge. The former consists of twelve, and the latter of eight, without including those who having been doge, continue procurators all the remaining part of their lives. These two offices are only biennial. Three *governatori* and two *procuratori* live in the palace with the duke; but are changed every three months. The *governatori*, together with the doge, constitute the *signoria*, or grand council of state, who deliberate on the most secret affairs, and afterwards lay matters of importance before the great council, in order to their receiving a general approbation: they also, in conjunction with the *procuratori*, assist at any interesting consultations of the great council. Without the privity and advice of the *procuratori* no affair of importance can be determined, and it is to them that the direction of the treasury and public revenues belong.

The great council is composed of four hundred, and the little council, which is as it were a committee of the former, of one hundred. None but nobles, and such as reside at Genoa, can be admitted into either. The members are annually changed by a new election, which is performed towards the end of December, by thirty persons selected for that purpose by the lesser council, out of one hundred persons proposed by it. Both colleges deliberate with the two higher colleges on the laws, customs, taxes, and contributions; but war, peace, and alliances, are only considered and determined in the lesser council. The five supreme *sindicatori*, who are generally chosen out of the lesser council, examine the conduct of the doge, the *governatori*, the *procuratori*, and other officers at the expiration of their employments. The *commissarios* of peace, who are three in number, and those of the laws two, are changed every two years. The former, who are citizens, inspect into the matrimonial affairs of the citizens, adjust petty disputes, or in case of obstinacy lay them before the *signoria*. They likewise assist at the election of a doge, and of all other persons in authority, especially of the thirty directors for elections, with respect to whom they are to examine whether their proceedings be legal, and whether in every other respect due obedience be paid to the laws.

Processes among the citizens are decided by the *rota*, a court consisting of five foreign doctors of civil and canon law, who live in the palace of the republic, and continue two years in office. Another college of seven native doctors of law, who are usually changed every half year, appoint guardians, see that processes are not protracted without cause, and that care is taken of the polity. There is also a particular penal-court called *rota criminalis*, and another that deserves commendation, which manages the affairs of poor debtors, or others detained in prison.

In short, the five censors take cognizance of the manufactures and trade, the quality of provisions, weights, and measures, and of the behaviour of the consuls and wardens of companies. Besides these there are several inferior offices, which the freemen are capable of exercising.

The ordinary revenue of the state is computed to amount to about half a million of *liri*; it arises from the duties on imports and exports: the regalia at Sarzana, Gavi, Savona, Vintimiglia, and other places; the woods and forests; the monopoly of wine, with respect to vintners and others, who keep cellars, and have no wine of their own; and of corn sold to bakers; together with fines, and the produce of all the revenues of Corsica: but these last, even when that island was quiet, scarce answered the charge of the troops, and the many civil officers kept there; which more particularly since the insurrection in that island, must have been of great expence to the republic.

When the above revenues fall short of answering the necessary expences, the state borrows from the nobles and rich citizens large sums, at a high interest on certain pledges, and even assignments on branches of the public revenue, which in 1407 gave rise to the famous bank of St. George, so called from St. George's church, where the directors formerly held their meetings. The opulence and power of this bank are very extraordinary, whole towns, manors, and territories belonging to it; and even great part of the island of Corsica. Among other

important privileges, it is invested with a particular jurisdiction, and is dependent only on the doge and state. This company has not only advanced large sums to the republic, but also to foreigners, as mortgages on lands or public revenues in other states.

The republic, in time of peace, usually keep on foot a body of above five thousand regular troops; namely, four thousand natives, the duke's life-guard of two hundred Germans, five hundred Swiss, three hundred Italians, and one hundred bombardiers. Besides these, there is also a militia, which, in case of necessity, is obliged to take the field. The cavalry raised in time of war only amount to about six hundred, who are but of little service, on account of the badness of the horses in this country. In the last war the republic had in pay eighteen thousand men. The fleet of this republic, antiently so celebrated for its victories over the Saracens, Pisanese, Venetians, Spaniards, and Turks, and for continuing a considerable time masters of Sardinia, Malta, Majorca, Minorca, Candia, Cyprus, and many other islands and places in the Mediterranean and Archipelago, and even of the Black-Sea, is now reduced to six galleys, which only serve, according to Addison and Keyser, to import corn and wine, and in summer-time to give the principal ladies of Genoa an airing.

The territories of the republic on the continent are, Riviera di Levante, Riviera di Ponente, and the marquisate of Finale.

The city of Genoa, which stands in the first of these districts, is the capital and seat of this republic. It is situated in the forty-fourth deg. twenty-five minutes north latitude, and in the eighth deg. forty-one minutes east longitude. Genoa is one of the most inconvenient, yet, at the same time, one of the most beautiful, cities in Italy, and is seen to the greatest advantage at the distance of a quarter of a league at sea, where its stately buildings, which have gained it the name of *Superba*, are seen to form a glorious amphitheatre, gradually rising up the side of a hill. This declivity, and the narrowness of the streets, exclude the use of coaches in Genoa, every body being satisfied with going on foot, except the principal ladies, who are carried in chairs and litters; but the loftiness of the houses and narrowness of the streets abate the excessive heats of summer, by intercepting the sun-beams, and thus tend to preserve the healthfulness of the city. The streets are exceedingly well paved, and in some parts with free-stone; besides, the want of coaches and other carriages greatly conduce to their cleanliness. As the barrenness of the neighbouring soil requires great quantities of manure, the dung of horses and mules is very carefully gathered up. This is chiefly observed in the suburbs of Pietro d'Arena, where the breadth of the streets admits the use of all kinds of wheel-carriages.

Most of the houses are flat-roofed, or at least have a gallery at top. The roofs are mostly covered with *lavagna*, a stone that very much resembles slate, and in the shelving situation of the city these areas, which are planted with orange-trees, form a kind of penfile gardens, which, though they have nothing wonderful nor extraordinary, have a very agreeable effect.

On the rocks projecting into the sea have been built several bastions, which, in some places, stand two or three behind each other, and the length of these fortifications, with the lower town, is not less than three Italian miles. The number of guns mounted upon all the works for the defence of the city, is little short of five hundred. Towards the land the city is surrounded with a double wall, and the outward, which is the newest, extends beyond the hill, beginning at the fanal, or lighthouse, and terminating at the river Bisagno. The city is ten miles in circumference, and such is the inequality of the country, that it takes up three hours to ride round it; but this wall is of too great an extent to be of any considerable service, unless, perhaps, in keeping out the banditti. The west side of the city is watered by the river Bonzevera, and on the opposite side runs the Bisagno.

The harbour of Genoa is large, but not very safe; however, no care or expence is omitted in improving it, and it has now a mole which extends upwards of seven hundred paces into the sea. On the right hand, near

the light-house, is also a new mole, which projects seven hundred and seventy-four paces, and is defended by huge fragments of rocks. As the sea is here very deep, those works must have been very expensive. In the middle of the harbour, at a place called the Royal Bridge, is a commodious watering-place for ships, the water being conveyed by pipes from the mountains. Within this harbour is the wet-dock for the republic's galleys, the largest of which carries only from sixty to one hundred soldiers, and three hundred and twenty rowers, five or six on a bench.

The Darsena, or wet-dock, abounds with Turkish slaves, who are generally of a furly fierce aspect, to which their long whiskers do not a little contribute. They are dressed in a coarse cloak, with a cowl to it like that of the Capuchins. In the Darsena they are at liberty; but in the city one meets them every where chained in couples, and crying cheese, cotton, cloth, &c. They also keep tippling-houses, and petty shops in the Darsena, their officers giving them all possible encouragement, advancing them small sums, with which, in their trips to Marseilles, Corsica, and other places, they buy all kinds of knick-knacks at a very cheap rate, and make a good market of them at Genoa, where every thing is extremely dear; but the officers come in for a share of the profits. Some of these slaves are furnished with goods to trade with out of the republic's warehouses, part for ready money, and part on credit at a stated price. At night none of them are to be absent from the Darsena; for then they are mustered and locked up.

The rowers on board the galleys generally consist of three classes. The first, indigent people, who sell themselves for a certain term of years. The second, criminals, who have been sentenced to the oar for a limited time, or during life; and the third, Turkish or Barbary prisoners, who, though they should become converts to Christianity, do not recover their freedom; but their godfathers frequently put them in a better way of living, and, upon their good behaviour, give them their liberty.

The light-house is a tower which is ascended by one hundred and sixty-six steps, and stands on the west side of the harbour on a high rock, which is also fortified. Every night, except about the summer solstice, a lantern with thirty-six lamps, is hung out at the top of it, towards the sea; and when a number of ships, or any fleet, is known to be in these seas, an addition is made to the number of lamps, which, at a distance, resemble a single star. Upon descrying a ship from the light-house top, a bullet is hung out, for two ships two bullets, and so on till five. The signal to give notice that a squadron is in sight, is one bullet and a flag.

The only straight and broad streets are the New and the Balbi streets. These entirely consist of magnificent palaces: in the former are those of the families of Doria, Palavicini, Lescari, and Correga, the second story of which opens into fine gardens and orangeries raised on brick-work. The Balbi street is greatly ornamented by the two palaces of the house of Balbi, the Jesuits college, and the Durazzo palace, the best secular building in the whole city. The houses of Genoa are, in general, well built, and painted on the out-side with different orders of architecture, and some of them with landscapes. For the better enjoyment of the cool fresh air, persons of rank frequently live in the third story.

The palace in which the duke resides is almost in the center of the city, and is an old large stone building, with two statues of white marble in the court, erected in honour of Andrew and John Andrew Doria. From the court is an ascent by a white marble staircase, with very low steps, to the great hall, where the doge is elected, and foreign envoys have audiences, which is sixty-six paces in length, and thirty broad. It is very lofty, but the floor is made of plaster; however, the cornices and architraves are finely carved and gilt, and the ducal throne covered with crimson velvet, enriched with gold fringes and tassels. In this stately hall stand six white marble statues of persons by whose liberality the public has been eminently benefited, and on the wall at the two ends, and on the ceiling, are painted six of the republic's principal achievements.

This hall opens into the summer council-chamber, in

which, among many other paintings, is a noble picture by Solimene, of the solemn reception of St. John the Baptist's ashes at Genoa. Near the throne is also represented the discovery of America by Christopher Columbus. Its private chapel is adorned with paintings in fresco of all the saints and celebrated natives of Genoa, among whom is also Christopher Columbus, who was a native of that city.

From the audience hall a narrow passage leads to the arsenal, which is also in the palace, and is said to contain arms for thirty-four thousand men. Among the antient weapons is shown a shield, containing one hundred and twenty pistol barrels, which a person named Julius Cæsar Vacche is said to have made, in order to dispatch, as it were, with one shot, both the doge and his counsellors, when assembled. But the most celebrated curiosity is thirty-three coats of mail belonging to so many Genoese heroines, who are said to have performed a crusade to the Holy Land, in the year 1301; but it is much questioned whether these coats of mail were ever used by women.

Prince Doria's palace and gardens near the harbour are very fine, and afford a most delightful prospect.

In the whole city are reckoned thirty-seven parish churches, twenty collegiate, seventeen convents, and two large hospitals.

The principal curiosity to be seen in the cathedral, which is dedicated to St. Lawrence, is a dish made of a single emerald, said to be one of the queen of Sheba's presents to king Solomon, and the very same in which Christ ate of the Paschal Lamb, at his last supper with his disciples. On the left hand of the entrance of this cathedral is a chapel, where thirty silver lamps are continually burning, and in which they pretend to keep, with extraordinary veneration, the bones of John the Baptist. The altar is supported by four columns of porphyry, and over it is a picture by Vandyke, and it is adorned with a white marble statue of John the Baptist.

St. Ambrose's church belongs to the Jesuits, and is a good structure. Over the great altar is an excellent piece by Rubens, representing the circumcision of Christ, where the emotions of tenderness in a woman standing by, are admirably expressed. The altar is adorned with four large columns of black marble, and the statues of St. Peter and St. Paul of white marble, St. Ignatius performing a miracle by Rubens, on another altar, and the Assumption of the Virgin Mary, give sensible pleasure to the connoisseurs in painting.

The Jesuits college is a very fine building. At the foot of the stairs, next the entrance, are two large lions couchant, of white marble. The court is surrounded with two lofty galleries, both supported by columns of Carrara marble, of which there are an hundred in number.

Near the Jesuits college is St. Ann's church, beautifully decorated with fine stucco, Florentine-work, and marble sculpture, in all which, however, it is surpassed by the church of St. Cyr.

In the way from the piazza Sarsano to the magnificent church of St. Maria Carignan, which stands on an eminence, is a stone bridge, that joins together two hills separated by a deep valley. This bridge consists of one small, and three large, arches, and is between eighty and ninety feet high, fifteen common paces broad, and between one hundred and sixty and one hundred and seventy in length. Under it are dwelling-houses from four to six stories high, and over them is still an open space of ten or twelve feet. The diameter of one of the arches in the street beneath is above thirty common paces; but the extent of the middle arch is still wider. This bridge cannot be seen without astonishment.

In the church of St. Filippo Neri, belonging to the fathers of the Oratory, are some fine paintings and admirable sculptures in marble, and in many places it is lined with a beautiful kind of marble, called Brocatello di Spagna. Every Sunday evening, during the winter, an oratorio, or religious opera, is performed in this church, founded on some scripture history, and is succeeded by a sermon near half an hour long, and then the service concludes with a piece of church music: but in the summer these fathers spend every Sunday in the afternoon at their garden without the city, in which is a beautiful edifice, where they have several kinds of games, as draughts, chess,

chefs and billiards, but cards and dice are not allowed. It is true, they do not play for money; but for *Ave Maria's*, *Pater nosters*, and other prayers; and at the breaking up of a party, the losers kneel before an image of the Virgin Mary, and there, according to their losings, discharge them unto her, or unto God, by *Pater nosters*, &c. In the evening they leave off playing, and an oratorio is performed; next comes a spiritual exhortation, and this medley of levity and religion closes with a solemn piece of music.

St. Stephen's church is worth seeing, on account of its admirable altar-piece of the stoning of St. Stephen, by Julio Romano, in which the rancour and fury of his cruel persecutors are incomparably expressed; and this is allowed to be one of the completest pieces that has appeared since the revival of painting.

In the year 1751, a new academy of painting, sculpture, and civil architecture, was instituted here, under the protection of the council. The chief hospital for the poor of the city of Genoa, stands on an eminence, and at present above 2000 persons, officers and servants included, are maintained in it. On this foundation, likewise, boys are brought up to handicraft trades, and when they have gained sufficient experience in their business, are allowed to go into the world to seek their fortunes. They are employed in weaving, shoe-making, the woollen manufactory, and other trades required to support such an hospital.

Little of the beauty of the fair sex is seen at Genoa, their blooming years being mostly spent in the recluseness of a nunnery. The married ladies are generally dressed in black silk or velvet, the liberty of choosing what colours they please expiring with the first year of their marriage.

It seems but little to agree with the reservedness and modesty of that sex, that most of the married ladies of distinction in this city are every where attended by a gentleman called a *cizisbeo*, who walks before their chair in the streets, and at coming into the church, holds the holy water to them, and, like a lover, does all the little arts of complaisance. Some ladies, not satisfied with one such obsequious dangler, admit several, who have their distinct offices; one attends the lady when she goes abroad; another provides for the table; another has the management of diversions and parties of pleasure; a fourth is even consulted about receipts and disbursements of money. Indeed both the beauty and wit of the lady are commonly rated according to the number of these votaries. They all pass under the denomination of Platonic lovers, and indeed, says Mr. Keysser, one would almost imagine that the husbands had nothing to fear from all these familiarities; for the Genoese being true Italians in point of jealousy, cannot be ignorant how far these intimacies may be carried, as they, in their turn, are *cizisbei* to other married ladies. Nor is this piece of gallantry confined to the young women only; for ladies advanced in years pique themselves much on having their *cizisbeo*. Strange as this custom is, it is not peculiar to the Genoese: we have given an account of one very like it at Vienna, from the travels of the Lady Wortley Montague. However, this custom is merely arbitrary at Genoa; custom does not oblige them to observe it, and it now seems to be in some measure on the decline.

At the funerals of single persons a kind of garland, decked with all sorts of white artificial flowers, is placed upon the coffin. When a person of distinction is buried, the religious fraternities walk in the procession with their white hoods drawn over their faces, carrying flambeaux in their hands, which they hold horizontally, that poor boys may earn a few pence by catching the wax on paper as it drops off. This intention is doubtless humane, but the number of ragged boys thus mingling with the procession, are no great ornament to the solemnity.

The inns of Genoa afford but an indifferent entertainment, and care ought always to be taken to agree for every thing before-hand. Their houses are furnished with wine from the republic's vaults, in sealed bottles, yet the wine is none of the best; and as all the landlord's profit arises from the empty bottles, he takes care to make it up in other articles. Besides this monopoly of

wine, which all who have none of their own growth must buy of the republic, it is the state only that deals in corn, none being sold in any market, but all bakers must apply for it to the public granaries.

S E C T. XVI.

The Island of CORSICA.

Its Situation, Extent, Produce, Rivers, History, and Inhabitants, with a concise Description of the City of Bastia.

CORSICA lies opposite to the Genoese coast, between the gulf of Genoa and the island of Sardinia; between the forty-first and forty-third degree of north latitude, and the eighth and tenth degree of east longitude. According to Bellin, it extends eighty-eight English miles in length, and forty in breadth. The island being for the most part mountainous, has little arable land, so that the principal fruitful parts are the plains and valleys, which produce corn, wine, figs, and other fruit, with plenty of olive oil and honey, wax, and other necessaries; but the honey is said to be bitterish, from the bees haunting the yew trees, great numbers of which are in the island. Here is also a considerable breed of cattle, and among the mountains very furious and untractable wild horses. The county of Nebio has alum and iron. Some of the deep valleys between the summits of the mountain are continually covered with snow, and yet in them are found salt-works, sulphureous hot baths, and beautiful crystals; and along the shore towards the Sardinian side, is a very fine coral fishery.

The chief rivers are the Guolo, or Gollo, the Tavignano, and the Talavo.

The unwholesomeness of the air is an invincible obstacle to the populousness of the island, as appears from a calculation made in 1736, by Baron Theodore, according to which the inhabitants amounted to no more than 120,000. In the beginning of the present century, 600 Greeks flying out of the Morea, on account of the exactions and rapine of the Turks, the republic granted them all the country between the bay of Sagona and Ajaccio, where they built handsome villages, and during the disturbances in this island, have given proofs of a firm attachment to the republic.

Corfica was anciently a small kingdom inhabited by the Saracens, but in the year 806 was conquered by the Genoese, who drove them out of it. In the eleventh century the island was taken from them by the Pisanese, but was afterwards recovered. In 1453, the revenues and government of the island were assigned to the bank of St. George, the directors of which, in 1465, ceded it to the duke of Milan; but the Genoese being unwilling to acknowledge his sovereignty, the island again fell to the bank of St. George. In 1553, the French seized upon the greatest part of it, but five years after restored it to the republic.

In 1564 the Corsicans revolted from the republic of Genoa, and, though reduced to obedience in 1569, still harboured in their breast an implacable resentment and hatred against the Genoese, for their rigorous treatment, in divesting their most eminent families of the privileges of nobility: excluding them from all ecclesiastical and military employments, prohibiting the natives in general all manner of trade, under-rating the best commodities, while they exacted an exorbitant price for any necessities sold them; in short, oppressing them with heavy taxes; all these evils being aggravated by the haughtiness and avarice of the republic's officers, the Genoese yoke became insupportable. Some disturbances which broke out in 1726, were soon quelled; but in 1729, a new tax being laid on the Corsicans, they absolutely refused to pay, requiring the republic to permit them to make their own salt, instead of buying it at Genoa at an exorbitant price. Upon this, Pinello the governor not only rejected their petition, but had recourse to violent measures for compelling them to pay the tax. This made them openly run to arms in their own defence, but in 1731 and 1732 tranquillity was restored by means of a body of imperial auxiliaries, and the next year, by the emperor's mediation, the republic

republic made some abatement in their demands on the Corsicans. However, the imperial troops had scarce quitted the island, when the commotions broke out again. In 1735, the malcontents formed a plan for a new and independent form of government, and the next year proclaimed baron Theodore Van Neuhoff, a native of Westphalia, who had brought them some military stores, their king, and he established certain fundamental laws for this new government.

The coronation of this monarch was performed with a laurel crown, on which occasion he caused medals to be struck, and on the sixteenth of September instituted an order of knighthood, by the title of the order of Deliverance. On the fourteenth of November he left Corsica, in order to solicit foreign assistance, and in 1738, returned with three ships full of military stores; but soon went again to solicit more assistance. The same year a body of auxiliaries being sent to the republic, in a great measure quieted the island: but on their leaving it in 1741, the animosities against the Genoese began again to blaze out, and in 1743 were heightened by Theodore's second return with assistance from England. His stay was then also but short; he left Corsica, and never more returned. In this and the following year there seemed an appearance of peace; and though the English fleet bombarded Bastia in 1745, and the malcontents got possession of the city, yet they soon lost it again, and have now to contend with a body of fresh succours which the republic has obtained from France. As to Theodore their king, after coming to London to raise money and friends for supporting his claim, he was several years confined in the King's Bench prison for debt, where he at length died, and a monument has been erected by some gentlemen to the memory of that unhappy nominal monarch.

In open ground the Corsicans are said not to be a match for regular troops; but in the mountains, where they generally keep, they have the advantage, and from time to time make successful sallies.

The clergy are very numerous, and are said to encourage a spirit of discontent among the people; a priest or monk having often been seen armed at the head of a body of Corsicans. It is computed that the Franciscans, Capuchines, and Servites, have no less than seventy-five convents in the island.

Corsica is divided into two large parts, the country on this side the mountains, on the north-east part, to which belong thirty pievi, or districts; and the country beyond the mountains, or the south-west part, which contains only eight districts.

Bastia is the capital of the whole island, and is seated in the division on this side the mountains, in the forty-second deg. twenty minutes north latitude, and in the ninth deg. forty minutes east longitude. It is the see of a bishop, and the residence of the Genoese governor. It lies on the sea, and has a good harbour, defended by a castle. The malcontents of Corsica have made several attempts on this city, which is at present defended by a French garrison. In this city is an academy of fine arts. In 1745, as has been already mentioned, it was bombarded by the English, and very much damaged, but after taking it, it was given to the Corsicans; yet they were again driven out of it, and, in 1748, it was besieged by the Austrians and Piedmontese, but made such a vigorous defence, that the besiegers were obliged to decamp.

SECT. XVII.

The Republic of LUCCA.

Its Situation, Extent, Produce, and Government; with a particular Description of the City of Lucca.

THE territories of this small republic lie on that part of the Mediterranean called the Tuscan Sea, and on the land side are chiefly bounded by the Tuscan dominions, a part only terminating on the duchy of Modena. This little country, which is only about thirty Italian miles in circumference, is exceeding fruitful and well cultivated; for the fertility of the soil and the mildness of the government have been such attractive inducements for settling there, that the inhabitants of the city, and the

hundred and fifty villages belonging to it, are computed at upwards of one hundred and twenty thousand, of whom between twenty and thirty thousand are able, on occasion, to bear arms.

Though this country is mountainous, it produces plenty of almost every thing but corn, of which they generally reap only as much as serves them half a year; and the rest they have from abroad. They have a sufficient quantity of rice, pulse, beans, lupins, and fine chestnuts, which the common people use instead of bread; with a variety of other fruits, and have plenty of wine: they likewise exceed all other countries in their olives, and the oil drawn from them. All corn is engrossed and sold by the state, distributing it to the bakers, who sell it to the public: in short, the industry of the people in improving every spot of ground is equally surprising and commendable, and the inhabitants appear with an air of cheerfulness and plenty, seldom to be found among those of the neighbouring country. The vicinity of the grand duchy of Tuscany keeps them constantly on their guard, in order to preserve their freedom, on which account the protection of some foreign power is absolutely necessary. In such a situation an universal concord and harmony can alone enable them to transmit to posterity the blessings of their darling LIBERTY, whose name they bear on their arms, and whose image is not only impressed on their coin, but also on the city gates, and all their public buildings.

The city of Lucca was anciently a Roman colony; afterwards it was comprized in the dominions of the kings of the Franks, and from them the emperors of Germany claimed its sovereignty. At the long interregnum the inhabitants formed the project of independency, which they carried on privately till the reign of the emperor Charles IV. when they openly detached themselves from the empire, and obtained the protection of Spain.

The principal person in the state is the gonfaloniere, which signifies a standard-bearer, and was formerly the title of the sovereigns of Florence. He is dressed in a robe of crimson velvet, with a bonnet and stole. His power resembles that of the doge of Venice and Genoa, but he is stiled only his Excellency. With him are joined nine counsellors, called anziani, or elders. These ten persons, who bear the title of eccellentissimi, while in the administration, live in the republic's palace, where their expences are defrayed at the charge of the state; but when they go abroad on their own private concerns, it must be incognito, and in a close sedan, with the curtains drawn. These are changed every two months, which, Mr. Addison observes, is the greatest security to their liberty, and in a surprising manner contributes to the quick dispatch of all public affairs; but in any remarkable exigence of state, he adds, it certainly requires a much longer time to conduct any great design calculated for the good of the commonwealth, to its maturity and perfection. The gonfaloniere and the nine anziani are chosen out of the great council, which is composed of two hundred and forty nobles, one half of whom forms the ordinary council, and the other the extraordinary; but both, once in two years, are changed by a new election.

The title of the state is the Most Serene Republic of Lucca. Its arms are azure, with the word LIBERTAS or, between two frets of or. The ordinary revenue of the republic is about four hundred thousand scudi, or about eighty thousand pounds sterling. It maintains a regular body of five hundred men, and seventy Swiss as a guard for the gonfaloniere and the nine regent counsellors.

The city of Lucca, the residence of the government, is situated in the forty-third deg. fifty-two minutes north latitude, and in the eleventh deg. twenty-seven minutes east longitude, in a most delightful plain of fifteen or twenty miles in extent, terminating in eminences, diversified with villages, seats, summer-houses, vineyards, meadows, and corn fields. Every thing that can contribute to use and pleasure is here in great plenty. The city is regularly fortified with eleven bastions faced with brick, and is about three Italian miles in compass; the ramparts are very wide, where is a delightful walk for the citizens, under the trees planted on them. The inhabitants amount to somewhat more than forty thousand,

among whom are great numbers of artizans and manufacturers, who carry on a considerable trade, particularly in silk goods. The houses are handsome, the streets broad and well paved, but most of them irregular.

The state-palace is a large building, and includes the arsenal, which contains arms for twenty thousand men. The cathedral is a Gothic structure, which has some admirable paintings, and in the vestry are eight large silver busts, and a golden crucifix of most exquisite workmanship, there being no less than twenty-four images upon it. This crucifix is said to have been pledged by the Pisans for twenty-four thousand scudi, for a limited term; but as they deferred redeeming it till the last day, and then came too late, the gates of Lucca were shut against them. The chief relic in this church is the *volto santo*, a wooden crucifix, which they believe was carved by the disciple Nicodemus, and is very different from the others, the body being covered either with a robe of velvet or damask, embroidered with gold, and on the head, instead of a wreath of thorns, is a gold crown glittering with jewels. It has several silver lamps continually burning before it, and stands in a chapel adorned with columns of porphyry and marble, where it daily receives the most profound adoration of the people, and, as a farther mark of the city's veneration, the impression of it is struck on their coin.

The see of Lucca, like some others, is under the immediate jurisdiction of the pope, which intitles the bishop to a pallium and cross, like an archbishop, and on public solemnities, the canons are dressed like cardinals.

On the high altar of the church of St. Maria Corto Landini, is the assumption of the Virgin Mary by Guido Rheni; on each side are some other pieces by the same hand. Another altar exhibits the Virgin Mary in the clouds, and two persons kneeling before her, with a Latin inscription to this purpose, "May our sins be covered by her snow-like innocence." The roof of this church is covered with fine painting in fresco and gilding, and its altars are adorned with excellent pieces of sculpture in marble.

In St. Augustine's church is an image of the Virgin Mary, with an infant Jesus on her left arm, under which is an inscription in Latin to the following purport:

"This image of the Mother of God, which formerly stood to be adored without the church of St. Augustine, being struck with a stone from the hand of an impious gamester, is famous for the wonderful effusion of blood which followed: she received the blow herself; and, to save her infant son, miraculously moved him from the right to the left arm. It is likewise terrible for having caused the earth to open, and through the chasm sending this monster of impiety quick into hell. The most illustrious and reverend canons of the Vatican, as a token of their veneration for this three-fold miracle, caused a golden crown to be placed on this image in the year 1690."

Without the church is shewn both the place where this fellow was at play, and where the image stood in the church wall; but it is now placed in a particular chapel, where is also seen the stone fastened to an iron ring, and the opening of the earth, which the vulgar believe to be bottomless, and to terminate perpendicularly in hell, but is too narrow to receive a man of any bulk: however, it has an iron cover fastened with two iron bolts, and near the image is this inscription:

"To efface his crime the Virgin pours forth streams of blood; but the impious wretch dies ignorant of her goodness and clemency."

In the center of one of the squares of this city, is a white marble statue of the Virgin Mary upon a high pillar.

The skill and industry of the inhabitants in their silk and other manufactures have gained this city the honourable surname of the Industrious. Here are seen more young women in the streets, shops, churches, and schools, than in any other part of Italy. The police is very commendable, and great attention is shewn to the suppression of luxury, superfluous magnificence, and such dissipations, as often prove destructive to families where no such restraints take place. At entering the city, travellers must deliver up their fire-arms; but on informing the guard at what gate they intend to go out, when they

leave the city, they are sure to find them there: they are likewise allowed to wear their swords three days, but afterwards must have a particular licence, which is generally granted only to persons of high rank, and to the knights of Malta and St. Stephen. No commoner, though he be one of the council, must appear with a sword, and no soldier without one.

Travellers are always welcomed here with an evening serenade; but this is accompanied with an humble intimation that they would be pleased to make some return for the honour done them.

S E C T. XVIII.

The Republic of St. MARINO.

Its Situation, History, and Government.

THIS small state is inclosed by Romagna and Urbino, and consists of a very high craggy mountain, with some eminences lying at its foot. The town, the seat of this republic, is seated on the summit of this lofty mountain, where it is generally hid among the clouds, and the streets are sometimes covered with snow, when it is clear and warm weather in all the country around. There is said to be neither spring nor rivulet in the whole dominion; but the people are well provided with large cisterns and reservoirs of rain and snow water. The wine that grows on the sides of their mountain is extremely good, and much better than any on the cold side of the Appenines, and their cellars have a natural advantage that renders them extremely cool in the hottest seasons; for they have generally in the sides of them deep holes that run into the hollows of the hill, whence there constantly issues a breathing kind of vapours, so very chilling in the summer time, that a man can scarce suffer his hand in the wind of them.

They have three castles, five churches, and three convents, and reckon about five thousand persons in their community. Both the inhabitants and the historians who mention this little republic, give the following account of its origin. St. Marino, by birth a Dalmatian, and by trade a mason, was employed above one thousand three hundred years ago, in the reparation of Rimini, and after he had finished his work, retired to this solitary mountain, as finding it very proper for the life of a hermit, which he led in the greatest rigours and austerities of religion. He had not been here long before he wrought a reputed miracle, which, joined with his extraordinary sanctity, gained him such esteem, that the princess of the country made him a present of the mountain, to dispose of at his own discretion. His reputation quickly peopled it, and gave rise to the republic which calls itself after his name; so that the commonwealth of St. Marino may boast at least a nobler origin than that of Rome; the one having been at first an asylum for robbers and murderers, and the other the resort of persons eminent for their piety. To this saint the best of their churches is dedicated, and there his ashes are deposited. His statue stands over the high altar, holding in its hands a mountain crowned with three castles, which are also the arms of the commonwealth. To his protection they attribute the long duration of their state, and consider him as the greatest saint next the blessed Virgin; and so high is their veneration for him, that, by a law in their statute-book, such as speak disrespectfully of him are to be punished in the same manner as those who are convicted of blasphemy.

This inconsiderable republic has lasted one thousand three hundred years, in which time all the other states of Italy have frequently changed their masters and forms of government. Their whole history is comprised in two purchases made of a neighbouring prince, and in a war, in which they assisted the pope against the lord of Rimini. In the year 1100 they bought a castle in the neighbourhood, and another in the year 1170. The papers of the conditions are preserved in their archives, and it is very remarkable that the name of the agent for the commonwealth, of the seller, of the notary and the witnesses, are the same in both the instruments, though drawn up at seventy years distance from each other, which cannot proceed from a mistake in the date, because the names of

the popes and emperors, with the year of their respective reigns, are set down in both.

About two hundred and ninety years after this, they assisted pope Pius II. against Malatesta lord of Rimini, and having helped to conquer him, received from the pope, as a reward for their assistance, four little castles. This they represent as the flourishing time of the commonwealth, when their dominions reached half-way up a neighbouring hill; however, they are now reduced to their antient limits: but were they to be attacked, they would probably sell their liberty as dear as possible; for there is but one road to climb up to them, and they have a very severe law against any of their own people that enters the town by another path, lest a new one should be worn out on the sides of their mountain; and all who are capable of bearing arms are exercised, and ready at a moment's call.

The government of this commonwealth was originally lodged in what they termed the arengo, a great council, in which every house had its representative: but finding great confusion arise from such a multitude of statesmen, they devolved their whole authority into the hands of the council of sixty. The arengo, however, is still called together in cases of extraordinary importance, and if, after due summons, any member is absent, he is to be fined to the value of about a penny English, which the statute says he shall pay without any diminution or favour. In the ordinary course of government, the council of sixty, which, notwithstanding the name, consists but of forty persons, has the administration of affairs. They are made up half out of the noble families, and half out of the commoners, but are not admitted till they are twenty-five years of age. These decide every thing by balloting, and chuse the officers of the commonwealth. They thus far agree with the great council of Venice, but enjoy a much more extensive power; for no sentence can stand that is not confirmed by two-thirds of this council, into which no person can be admitted during the life of his father, nor two be in it of the same family, nor any one enter but by election.

The principal officers of the commonwealth are the two capitaneos, whose power resembles that of the old

Roman consuls; but they are chosen every six months. Some have served this office six or seven times, but the same person never enjoys it twice successively.

The third officer is a commissary, who judges in all civil and criminal affairs; but as the many alliances, intermarriages, and friendships, and also personal feuds and animosities, might, in so small a state, obstruct the course of justice, if this office was in the hands of one of their own number, the commissary is always a foreigner, who is chosen for three years, and maintained out of the public stock. He must be a doctor of law, and a man of known integrity; he is joined in commission with the capitaneos, and acts much in the same manner as the recorder of London under the lord mayor.

The fourth man in the state is the physician, who must also be a stranger: he is maintained at the public expence, and is obliged to keep a horse to visit the sick, and to inspect all the drugs that are imported. He must be at least thirty-five years of age, a doctor of the faculty, and eminent for his honesty and piety, that the commonwealth may not be depopulated by his rashness or ignorance; and that they may not suffer long under a bad choice, he is elected only for three years.

Another person, who makes no ordinary figure, is the school-master, and there are scarce any persons in the place who have not some tincture of learning.

The statutes of the republic are printed in one volume in folio, and in the chapter on the public ministers it is said, that when an ambassador is dispatched from the republic to any foreign state, he shall be allowed, out of the treasury, to the value of a shilling a day.

In short, says Mr. Addison, who took a journey on purpose to visit this little republic, and from whom we have borrowed this account, these people are esteemed very honest and rigorous in the execution of justice, and seem to enjoy more content and happiness among their rocks and snows, than the other Italians in the pleasantest vallies in the world. Indeed nothing can be a greater instance of the natural love of mankind for liberty, and of their aversion to arbitrary government, than such a savage mountain covered with people, while, in the same country, the Campania of Rome is almost destitute of inhabitants.

C H A P. XXIV.

Of the Middle Part of ITALY, containing the Grand Duchy of TUSCANY and the Dominions of the Pope.

S E C T. I.

Of TUSCANY in general.

Its Situation, Extent, Produce, hot Springs, and Rivers. Its History, the Arms of the Great Duke, his Forces and principal Officers, with the Divisions of the Country.

IN the middle part of Italy is generally included the little republic of St. Marino, and some authors also include in it the republic of Lucca; but as we chose to place all the four republics of Italy together, we have given these in the two concluding sections of the last chapter, and shall now, in this middle part, consider two grand divisions, which will contain abundant matter to gratify the curiosity of the lover of antiquities and of the polite arts, the noblest productions of statuary, painting, and architecture, both antient and modern. But all the wealth of these countries is deposited in the palaces of princes, and in churches and convents; while the people are poor, some of the richest lands in the world uncultivated, and trade in many parts neglected, for want of the specie necessary to give life to commerce.

The grand duchy of Tuscany borders on the Mediterranean, which here receives its name from this duchy, and is called the Tuscan Sea; it is also bounded by the Ecclesiastical State, the duchy of Modena, and the republic of Lucca. Some small detached parts of this duchy also lie among the territories of Modena, Lucca, and Genoa. These last excepted, it extends from north to south one hundred and sixteen miles, and from east to west eighty.

The great variety of hills and vallies, rising grounds and plains, render the country very pleasant. The soil, which is extremely fertile, abounds in corn, oranges, lemons, and all the other sorts of fruit known in Europe, besides oil and excellent wine. The oil, however, bears little proportion to the multitude of olive-trees, which are subject to a distemper, that shews itself in knots and tubercles, occasioned by worms. Of the wines a kind of white, called la Verdec, is particularly esteemed, and the greatest part is said to be sent to England. The pastures here are also very rich.

The air of several places in this duchy is unhealthy, on account of the many fens and wild desert places. The

salt

salt pits are in a thriving condition, veins of salt running under the strata of alabaster. Here are also found sulphur and Chalcedony, amethysts, fine jaspers, beautiful marble, and cornelians, lapis-lazuli, borax, and black slate for tables, crystals, alum, stone, iron ore, quicksilver, and in Calabria manna is gathered from the ash and elm. It oozes out on the taking off the rind, and consequently is not a production of the air but of the tree. The bees carry off a great deal of it, the remainder is applied in Tuscany to medicinal uses, and in France to giving a gloss to cloth.

At the foot of Mount St. Giuliano, on the borders of the territory of Lucca, are several hot springs, which have been mentioned by Pliny, and are still in high vogue, great numbers having experienced their salubrious effects. They are not properly sulphureous, and the taste is pleasant, like good spring-water. The degree of heat is not the same in all the springs; but at Acqua it is forty-nine degrees by Fahrenheit's thermometer. Close by these springs are others quite cold. At Vicasio the bath is but just luke-warm; but that at Morba has a heat of one hundred and four degrees by Fahrenheit's thermometer. The Lagoni at Monte Cerboli have a vehement ebullition, attended with a great noise, and contain sulphur, alum, vitriol, and salt: the heat much exceeds that of boiling water. Here is crystallized sulphur, a new and uncommon species of crystal. Another spring in this part of the country has one hundred and sixty degrees of heat, with a sulphureous smell, and is used to bathe in. In the baths de la Galeria are both cold and warm sulphureous springs, with petroleum floating on the surface. Besides these there are several others.

The principal river in this country is the Arno, which rises in the Appennine mountains in the territory of Florence, and after receiving the Sieva, Pesa, and Elsa, falls below Pisa into the sea. The Ombrone has its source in the territories of Sienna, through which it runs into the sea.

This country was called Etruria, or Tuscia, from its ancient inhabitants the Etrurii or Tuscani; though the present duchy does not comprehend all the ancient Etruria. In the ancient republic of Florence, the family of Medicis acquired by commercial arts the wealth and grandeur of princes, whence king Henry II. of France chose his consort the famous Catharine out of this family. The emperor Charles V. in 1531, created Alexander Medicis duke of Florence, and afterwards gave him Margaret his natural daughter in marriage. Cosmo I. the successor of Alexander, was, in 1569, declared great duke of Florence, by pope Pius V. which was ratified by the emperor, on condition of his holding it as a fief of the empire; and in 1699 the emperor conferred on the great duke the title of royal highness.

John Gaston, the last great duke, having no heirs, it was stipulated by the quadruple alliance in 1718, that the duchy should for ever be acknowledged a fief of the Roman empire, and that with the consent of the Germanic body, the emperor should confer it on the king of Spain's eldest son by the second marriage, from him to devolve to his male descendants; but that Leghorn was always to remain a free port. This was confirmed by several succeeding treaties; but a war breaking out in 1733, in which the emperor lost the kingdoms of Naples and Sicily, Don Carlos, who had been brought up at the great duke's court, caused himself to be proclaimed king, and at the peace of 1736 retained the possession of these kingdoms. On the other hand it was stipulated, that after the demise of the present possessor, Tuscany was to devolve to the house of Lorraine in lieu of that duchy, which was to be resigned to king Stanislaus. This took place in 1737, and soon after the duke of Lorraine and the great duke of Tuscany made an agreement with the princess dowager Palatine, sister to the late great duke, concerning the moveable parts of the succession, by virtue of which she transferred to the duke the vast treasure of jewels, statues, paintings, and other curiosities, of which particular mention will be made in treating of Florence.

The arms of the great duke are, or, six globes gules, with the lilies of France in the uppermost. The shield is surmounted by a regal crown, in which is a full red

lily. The helmet is also crowned, and the crest is a bird holding in his right talons a ring, from which hangs a label, whereon the word SEMPER is written.

There is here an order of knighthood called the order of St. Stephen, instituted by Cosmo I. in 1554. Its privileges are very like those of the order of Malta. The great duke is always grand master, and the chief residence of the knights is at Pisa, in treating of which city, we shall give a more particular account of that order.

The ordinary revenue of the grand duke is computed at about three millions of piastres per annum. In 1753 the military force of this duchy was settled at three regiments of foot, and one of dragoons of 500 men; but in 1755, another regiment of dragoons was raised, and the militia was formed into regiments. However, this duchy is said to be able, in case of necessity, to bring into the field 30,000 men, and to fit out twenty ships of war, twelve gallies, and some galleasses.

The chief officer of this duchy is a governor appointed by the emperor as grand duke. He resides at Florence, where is also a council of regency, the military board, and other state offices.

The countries of which this great duchy is composed, are the following; the territories of Florence, Pisa, and Sienna, with the states of Presidii and Piombino.

S E C T. II.

The FLORENTINO, or Territory of FLORENCE.

Its Situation, Produce, and the Manner in which its ancient Inhabitants lost their Liberty; with a particular Description of the City of Florence, and the Manners of the Inhabitants.

THIS is the most considerable part of the duchy of Tuscany, both for extent and opulence. It is divided in the middle by the river Arno, and is bounded on the north by the Bolognese and Romania, on the east by the Ecclesiastical State, on the south by the Siennese, and on the west by Pisa and the republic of Lucca.

The territory of Florence is well cultivated and populous, and justly esteemed an excellent country. The environs of the city of Florence are particularly delightful, from the variety of the well cultivated hills and dales; and in the neighbourhood of that city is a kind of white marble, and a sort of slate, which, when polished, represents an infinite variety of brown and yellow figures, and by a little help of the imagination, seems to represent trees, landscapes, the ruins of castles, and several other agreeable objects.

Anciently the city of Florence, with its district, formed a republic, for which the inhabitants obtained a licence from the emperor Rodolphus for sixty thousand guilders; but its aristocratical government was filled with apprehensions and jealousies from the increasing grandeur of the family of Medicis. In the war between the emperor Charles V. and pope Clement VII. the government had the misfortune to offend the former, and upon the conclusion of the peace in 1530, the emperor marched his army into the city, and having abolished the republican constitution, nominated Alexander de Medicis duke, prescribing him a model of government, and pardoning the city, on condition that, for the future, it should pay obedience to the emperor, and the sovereigns appointed over it.

The principal city is Florence, in Italian Fiorenza, the capital of the grand duchy, delightfully situated between mountains covered with olive trees, vines, farms, seats, and villages, in the four hundred and thirty-ninth degree forty-two minutes north latitude, and in the eleventh degree forty-seven minutes east longitude. It is divided into two unequal parts by the Arno, which, with its four stone bridges, adds to the beautiful appearance of the city. With respect to curiosities worthy the notice of a traveller, it is, next to Rome, the principal city in all Italy. The Florentines pride themselves so much in its elegance, that they imagine nothing equals it. The streets are indeed clean, and paved with very broad

broad stones, but most of them are narrow and crooked, and many of them have scarce room for a carriage to pass. The number of houses amount to about 9000, and among them are some magnificent stone buildings; but their palaces are not so numerous as to claim a superiority over those of Turin, Genoa, and Rome. The paper windows, which, after the Italian manner, are every where seen, are no small diminution to the beauty of the city, which is generally reckoned to contain seventeen market places, seven fountains, six columns, two pyramids, 160 public statues, forty-four parish churches, twelve priories, fifty-four convents, twenty-four ecclesiastical fraternities, and thirty-seven hospitals and charitable foundations. The number of inhabitants is computed at 70,000.

The pronunciation of the Italian here, differs much from that in other places, the *r* being changed by them into *h*; for instance, they say *hosa*, instead of *cosa*; and their accent is so guttural, that they are called the Italian Swifs. However, they write much better, having, for the improvement of the Tuscan tongue, a celebrated society of learned men, who stile themselves *Accademia Della Crusca*. Since the year 1738, a riding academy was erected, and since 1753, an academy of agriculture, consisting of a hundred members. The greatest trade of the city consists in its woollen and silk stuffs, and even the nobility not only trade as merchants, but keep shops. A faint shadow of the ancient republic still remains among the nobility, some of whom are are stiled senators, though they in reality constitute nothing more than a magistracy.

From this general view of the city, we now come to its curiosities, of which we shall treat in their proper order.

The great dukes formerly resided at the Palazzo Vecchio, or the Old Palace, which faces a large market called la Piazza del Gran-Duca. At the entrance is a marble statue of Hercules killing Cacus, both bigger than the life, by Baccio Bandinelli; opposite to which, by way of contrast, is David triumphing over Goliath, by Michael Angelo. In the middle of the court is a porphyry fountain, with a boy grasping a fish, in bronze, and another statue of Hercules killing Cacus. There is a hall in the palace one hundred and seventy-two feet long, and seventy-four broad; but it is too dark: however, on account of its spaciousness, it is used for homage ceremonies, and for the dances on St. John's day, which are annually performed by a company of peasants of both sexes, when the ducal family are generally present, and the duke distributes the appointed prizes to the best dancers. On the ceiling and walls of this room are painted in fresco, the most remarkable achievements of the republic of Florence. A traveller ought not to omit observing the marble statues of several dukes, and two popes, who were of the house of Medicis. Here is likewise a most admirable statue of Victory, with a prisoner at her feet, by Michael Angelo. Here are also six excellent marble groups, by Vincenzo Rossi, representing six of the exploits of Hercules; his dashing Anteus against a rock, his killing the Centaur, his throwing Diomedes to wild horses, his carrying a terrible wild bear alive upon his shoulders, his helping Atlas to bear up the sky, and his victory over the queen of the Amazons.

In the Old Palace is the duke's wardrobe, in which are ten or twelve large closets full of plate, great part of which is finely chased and set with jewels. Here are also abundance of Turkish arms and bridles profusely enriched with jewels, and in a particular closet is shewn the crown with which pope Pius V. in 1569, crowned Cosmo I. as first great duke of Florence. It is made of gold, and adorned with a great number of jewels. But what is esteemed most valuable, is the palliotto, or altar cloth, covered with pearls, rubies, and other stones; among the rest, two gems called aqua marina, in size equal to a large walnut, are said to be of inestimable value. On both sides the arms of Austria and Florence are joined together, and in the middle of the palliotto Cosmo II. is represented in an embossed work of gems and enamel, and his robe is richly set with diamonds.

On the altar or table before which he kneels, is a crown entirely covered with diamonds.

Near the Old Palace under the Loggia, commonly called de Lanzi, are three fine statues, the first of Judith with Holofernes at her feet, of bronze; another, of the same metal, representing Perseus with Medusa's head: the third piece, where admiration can never be satisfied, is a group representing a young warlike Roman carrying off a Sabine virgin; he is transported with joy on account of his booty, while her father lies prostrate on the ground, with looks full of the most passionate grief and rage. The rape of the Sabines is expressed in basso relievo on the pedestal, and the performance of this piece does great honour to Giovanni Bologna.

In the square before the Palazzo Vecchio, is a very grand fountain, adorned with shells, cornucopias, tritons, and four other sea-gods of brass, of a very large size; and in the center is Neptune drawn in a large shell, resembling a triumphal car, by four horses, two of which are of brass, and the other two of white marble.

In this square is likewise the Fabrica degli Uffici, on the ground-floor of which the principal magistrates of the city live together, for the better maintenance of the public tranquility, and the more speedy dispatch of business. The first story is filled with artists employed for the duke's wardrobe and gallery, particularly in Florentine works, where nature and painting are surprisingly imitated by the proper arrangement of sparks of gems, and bits of the finest marble inlaid. This place is distinguished by the name of il Scrittorio, and though the artists chiefly work for the duke, yet the most industrious find time to make toys to dispose of to foreigners, which are sold at a great price.

The uppermost story of this structure contains the famous gallery, in which perhaps are the noblest collection of curiosities that are to be met with in any part of the world. In its form it resembles the Greek Π ; the ceiling is covered with paintings representing the arts and sciences, the most eminent personages of the city of Florence, and historical pieces. The walls on each side are hung with portraits of the most illustrious persons of the house of Medicis, and over these, on the entablature, are small portraits of generals, ministers of state, and princes; and opposite to them the busts of learned men, among which is that of the great Sir Isaac Newton. The vast number of statues is really amazing: among these is Narcissus stooping to view himself in a well of Parian marble, an excellent performance; Bacchus, with a goblet in his left hand, leaning upon a Faunus, who is kneeling before him; and near this antique stands a Bacchus of Michael Angelo, being a copy of the former. Bacchus riding upon a tyger, both of bronze, is justly reckoned one of the most remarkable pieces here; but the feet are wanting. The pedestal on which it stands is the work of Guiberti, and on one side of it is represented, in basso relievo, the story of Ariadne, and on another a sacrifice to Bacchus. Morpheus is here represented in the shape of a sleeping boy, in touchstone; probably the blackness of this stone, which was always used for the statues of sleep, as Mr. Addison observes, alludes to the darkness of the night, the proper season for rest. Farther in the gallery are to be seen Mars and Venus, Cupid and Psyche, several Ganymedes, Marsyas, a philosopher, a Venus sitting and drawing a thorn out of her foot; Venus Urian; Venus persuading Mars to stay with her, and Apollo with Faunus; Flora; a vestal, with the holy fire burning before her, &c. Among the busts or heads, the most curious are those of Alexander the Great, three times bigger than the life, and Agrippa, Caligula, and Otho; the busts of Antinous, Nerva, Aelius Verus, Caracalla, Pertinax, and several others, in fine alabaster. Among these pieces is also a bronze head of Michael Angelo, done by himself.

Out of the gallery you enter several cabinets full of curiosities, which are well worth seeing. In the first are above an hundred and twenty portraits of celebrated painters, most of them done by the persons they are designed for, and all in gilt frames, with the names over each of them; among these is Sir Godfrey Kneller. In the

The middle of the chamber stands the statue of Cardinal Leopold de Medicis, of white marble. He was a great encourager of arts and sciences, particularly of painting.

The next cabinet contains a noble collection of large porcelain vases, &c. There is also shewn in this apartment a large table, on which is represented birds, flowers, fruit, and festoons, in excellent Florentine work: twenty-five persons were employed thirteen years in performing this curious piece. The artificial curiosities of ebony in another cabinet is the more extraordinary, on account of their variety of sculpture, it being extremely difficult to carve it with any degree of nicety, on account of its splitting. The largest of these ebony works represents a palace with several gates. The chief Scripture histories are exquisitely painted on gems by Bruggel. In the next chamber is to be seen the anatomy of a human head in wax, and also the gradual petrification of the body, till at last it terminates in a bare skeleton. These were performed by a Sicilian ecclesiastic, and Mr. Keyser observes, that however disagreeable such a spectacle may be to timorous self-love, the execution is so natural and delicate, that a person is never tired with viewing it. The same admirable artist has in the same manner exhibited the various stages and effects of the plague.

In another chamber is a large collection of mathematical instruments. Among the optical rarities are several heads and trophies of standards, colours, spears, &c. painted on a table, which when viewed through a glass in a tube, exhibit the picture of the present duke's grandfather.

On entering the Tribuna, the eye is immediately struck with six marble statues standing in the center, among which is the celebrated statue called the Venus de Medicis, which has been unanimously esteemed to surpass not only all the statues in Florence, but any piece of sculpture throughout the whole world. The inscription on the base shews it to be the work of Cleomenes, an Athenian, the son of Apollodorus. This incomparable statue stands between two others of the same goddess, which in any other place would pass for admirable pieces; but here they serve rather as foils to the Venus of Medicis, only increasing the admiration of it, while their own excellencies are quite unnoticed. That on her right hand is twice as big, holding the golden apple, and is termed Venus Victrix; the other, a noble statue by Hercules Ferrata, distinguished by the name of Venus Urania. On one side of this last statue is a dancing Faunus, whose sportiveness and agility are finely expressed. Michael Angelo is said to have added the head and arms; but the piece is originally ascribed to no less a person than Praxiteles. Next to this is Arretino, an old man resting upon one knee, and whetting a broad knife upon a stone, with his head erect, and, as it were, listening with great attention; but very cautious of being observed. The head and hair of this piece are particularly admired. The sixth piece is a group representing two wrestlers engaged, and one of them throwing his antagonist, who, in the struggle, at the same time breaks his own arm. The heads in this group are also executed with admirable skill. It is said that this piece was dug up at Rome.

The remarkable diamond that used to be shewn here, has been removed from the Tribuna to the duke's private cabinet; but an exact model, made of yellowish glass, now supplies the place of it. The original, according to Tavernier, weighs 140 carats and a half, and was the largest diamond in Europe, till Mr. Pitt brought from the East Indies a diamond that exceeded it, which was sold to the Regent of France, and is the most costly and superb jewel belonging to that crown: the great duke is said to have bought his of a Jesuit for 75,000 scudi, about 18,750*l.* but the father had a most exorbitant profit, having given only a single paolo, or about sevenpence sterling for it on the Piazza di Navona, where it was offered to sale as a bit of crystal.

In a particular closet in the Tribuna are kept several vases of lapis-lazuli, jasper, cornelian, agate, &c. some set in gold, and enriched with jewels of a prodigious value. Here is also a most rich and admirable cabinet, with fourteen beautiful pillars, the shafts of which are

of lapis-lazuli; but the pedestals and capitals of solid gold enriched with pearl and turquoise. The interstices between the pillars are filled with basso relievos in gold. In the center of the upper part is a pearl that has but few equals, it being nearly of the size of a walnut; but the aqua marina in this piece is something larger. It has also a topaz of a prodigious size. This magnificent cabinet serves for keeping intaglios and camei, or gems cut in relievo. The heads of the kings and heroes make forty-two pieces. Here are also forty intaglios representing persons in masks, twenty-eight philosophers and poets, and near an hundred pieces of pagan deities, all antiques. The historical and mythological intaglios amount to a thousand. Besides these, and many others, there are three hundred and twelve medallions, one thousand six hundred gold medals, eight hundred silver, and about two thousand two hundred of copper. The gold, silver, and copper medals, struck in honour of cities and states, amount to one thousand five hundred pieces. In short, the whole collection is composed of fourteen thousand antique medals, and eight thousand modern.

The palace where the great duke usually resides, is called the Pallazzo de Pitti, where the best front is next the gardens; the columns of the first story being on that side, of the Doric order, those of the middle Ionic, and the third Corinthian. The apartments are well furnished, especially with fine pictures, and the ceilings beautifully painted by the great masters. From this palace is a covered gallery for the great duke to go to the Palazzo Vecchio, where, through little private apertures, he may hear and see what passes in the several courts of judicature. This gallery is six hundred paces in length, six paces in breadth, and eight in height, and on the walls on both sides are fine historical paintings.

The garden of the last mentioned palace is three Italian miles in circumference, and the highest part of it affords a noble prospect. The fine fountain which fronts the palace has a noble appearance; in the middle of the basin is a Neptune, of marble, of a very large size, in a shell of Egyptian granate, thirty-six feet in circumference. Three other statues of the Ganges, Nile, and Euphrates, are represented in a sitting posture, pouring water into the shell. In the grottos and fountains of this garden are to be seen, among several others, four statues by Michael Angelo. Nothing can be more delightful than the alleys and covered walks of laurel and other ever-greens, and every part abounds with espaliers of orange, lemon, jasmine, and pomegranate trees. On one side of the garden is the duke's menagerie, where are kept foreign fowls and wild beasts.

The principal church is the cathedral, called St. Maria del Fiore, which is four hundred and ninety feet long, and three hundred and eighty English feet to the top of the cross. The cupola is octangular, and the breadth of each side twenty-five feet; the paintings in the upper part representing the mansions of bliss, and below them the place of torments. Under the cupola is the choir, the pillars of which are intermixed with the statues of the twelve apostles in white marble. On the great altar stand three marble statues of a large size, one of the Supreme God and Father sitting, the two others representing the dead body of Christ, supported by an angel, done by Bandinelli.

Near the church is a square tower built of red, white, and black marble, on which are erected a great number of fine statues. Opposite to the cathedral is the church of St. John the Baptist, supposed to have been anciently the temple of Mars. It is of an octangular form, and has three brass gates, formerly gilt, on which several histories of the Old and New Testament are so admirably expressed in basso relievo, that Michael Angelo, in the extacy of his admiration, could not forbear saying they were worthy of being the gates of paradise. Over the chief entrance are three marble statues representing Christ's baptism, with three brass statues over the door of the decollation of John the Baptist. Over the third door are three statues in bronze, of John the Baptist discoursing with a Pharisee and a Scribe. In the court before the middle gate, is a fine pillar of granate, which was a present from the Pisans to the city of Florence.

Near them stands another column, erected in memory of a pretended miracle wrought by the body of St. Zenobius, on its being removed from St. Laurence's to the cathedral church, when his bier accidentally touching the trunk of a dry elm, that lay upon the ground, they pretend that it immediately became sound and cloathed with the liveliest verdure. In the church are sixteen large pillars of oriental granate. The whole cieling is of Mosaic work, representing eminent persons, and done by Apollonius, a Greek, Andrea Taffi, Gaddi, &c. The font is large, and adorned with several beautiful marble sculptures, particularly a statue of John the Baptist standing before it. Here all the children born of christian parents within the city of Florence, are baptized. The pavement of the church is inlaid, and on one side of it are represented the sun, and the twelve signs of the zodiac, with the following inscription, which is the more remarkable, as it may be read backwards as well as forwards :

En giro torte sol ciclos, et rotor igne.

“ Behold the sun pursues his oblique way,
“ And with his fiery vertex brings the day.”

On midsummer day, at noon, the sun is said to be directly concentric to a solar disk cut in a window opposite to this representation of that luminary.

One of the principal relics of this church is the finger with which it is pretended John the Baptist pointed to Jesus, when he said, “ Behold the lamb of God,” and which the people worship with the most zealous adoration.

In the church of the Annunciation, the walls and cielings are hung with votive offerings, it being famed for a miraculous picture of the Virgin Mary, which indeed brings a great deal of money to the clergy. The story is, That the Servites, to whom the church and adjacent convent belong, employed a painter to draw the Annunciation of the Virgin in fresco ; but when only her face was wanting to finish the work, the artist was extremely perplexed how to give it a suitable perfection, and falling asleep under this disquietude of mind, when he awoke he had the pleasure of seeing the cause of his anxiety removed, and the face completely finished. It is not questioned that he received this assistance from the angels, and the Florentines, from the many miracles performed by it, wonder how any one can have the least doubt of it. Among other things, it is said, that they who look on this picture will never be troubled with sore or weak eyes. Mr. Keyser observes, that another artist probably played the sleeping painter a trick, which he and the monks had the address of turning to their advantage ; or the whole might be a contrivance of the painter himself, in order to get a name by being on such good terms with the angels. He adds, that this piece is far from being an angelic work ; for though the person and attitude of the angel are proper and graceful, and the painting of Mary, at the sight of the heavenly messenger, happily designed, yet the wonder-working face is not to be compared with some hundreds of pictures by hands merely human. This piece is covered with three curtains, and placed in a chapel with a multitude of silver votive pieces hanging about it. The chapel is curiously adorned with marble, the pavement is of Egyptian granate and porphyry, and it is illuminated with above forty silver lamps and branches. Before the altar are two silver candlesticks of the height of a man, and upon them are two large silver statues, representing two angels. Every part of the altar is covered with basso relievos, and the tabernacle is extremely rich.

In St. Laurence's church are two pulpits, supported by marble columns, and adorned with basso relievos by Donatello, and in the new vestry are shewn the tombs of some princes of the house of Medicis, done by Michael Angelo. Behind the high altar is the entrance into the chapel designed for the burial-place of the great dukes of Florence ; it has been begun ever since the year 1604, and is not near finished, though the ducal family is extinct. It is of an octangular form, and the altar is richly adorned with lapis-lazuli, chalcedony, porphyry, and other valuable stones. Indeed the whole chapel is, in a manner,

lined with these and other materials equally expensive. The lower part of the walls are every where encrusted with fine Sicilian jasper, with green and yellow veins, and above this is a red Florentine marble, variegated with white spots. The inscriptions on the tombs are of chalcedony, inlaid with red porphyry, and the finest ivory is not whiter than these letters, every one of which cost three Spanish pistoles. The sarcophagi on some of the monuments are of Egyptian granate, which is of a deep red, and others are of oriental granate. Upon the sarcophagi are cushions of red jasper, profusely enriched with jewels ; the expence of each cushion is said to be sixty thousand scudi, about twelve thousand five hundred pounds sterling. At each end of these cushions lies a regal crown, glittering with pearls, diamonds, and other jewels of immense value. Lastly, the bronze statues of the great dukes, for whom the monuments are erected, stand in niches of touch-stone, and every statue is ten feet high. The Mausolea are separated from each other with double rows of jasper columns, with capitals and cornices of brass gilt, and between these columns are placed large urns of Corsica jasper, with green and white veins inlaid with Florentine work. The walls are ornamented with the arms of the principal cities in the duke's dominions, of the same work.

We have not room to describe the multitude of statues and pictures with which the other churches of this city are adorned. Notwithstanding all this splendor, the appearance of the city suffers considerably from the great number of paper windows to be seen here. However, among its ornaments is a vast Doric column of one piece of granate, which stands before the church of St. Trinita, and serves for a pedestal to a porphyry statue of Justice with her balance, and a royal mantle of bronze. This granate column is said to have been found at Rome, in the emperor Antoninus's bath.

In the middle of one of the streets is a fine statue of Hercules killing Nessus the centaur, cut out of a single block of white marble, by Giovanni Bologna.

In the Old Market, where provisions are sold, the goddess of Plenty, done by Donatello, stands upon a granate pillar.

The New Market is properly the exchange of Florence, where, about noon, the principal merchants meet to do business, many of whom are of great families. Some of the nobility deal in a retail way ; and a noble Florentine often condescends to measure out a yard of silk.

A particular part of the city, noted for houses of ill fame, was assigned by Cosmo I. to the Jews ; and an inscription at the entrance of this street observes, That it was thought more adviseable to permit the Jews to remain in the neighbourhood of Christians, that, by their good example, they might be brought to submit to the easy yoke of Christ, than totally to expel them.

The Florentines attribute the vivacity and penetration by which they boast that their countrymen have made superior improvements in the polite arts, to the purity and salubrity of the air ; and they never mention their countrymen Michael Angelo, Dante, Petrarch, and other great men, without transports of admiration. They are inimitable in making repartees, and telling stories with a good grace ; but are so infatuated with these endowments, that the government of the tongue is but little known amongst them : but happy would it be for them, if this vanity was all that could be laid to their charge ; for they are, even to a proverb, addicted to that most unnatural vice which brought down the Divine vengeance on the cities of Sodom and Gomorrah.

At the distance of an Italian mile from the city is Poggio, or Villa Imperiale, a palace belonging to the duke, with a very delightful range of trees leading to it, and both sides bordered with vineyards, convents, and villas. The apartments of the palace are very fine, and the garden belonging to it extremely delightful.

Six Italian miles from Florence towards Bologna stands Pratolino, another palace belonging to the great duke. The apartments and halls are very rich, and the paintings exquisite. The garden abounds with beautiful allies, covered walks, mazes, grottos, and water-works.

The road from Florence to Vienna is paved, and still exhibits

exhibits many remains of the ancient *Via Cassia*. It extends over a chain of hills, and though the country is not so fine as that between Florence and Pisa, it affords very delightful prospects, it being every where planted with vineyards and olive-yards.

S E C T. III.

The PISANO, or Territory of PISA.

Its Situation, Produce, and Extent; its History, with a particular Description of the Cities of Pisa and Leghorn.

THE Pisano, a territory of Tuscany, is bounded on the north by the territory of Florence and the republic of Lucca; on the east by the Siennese; and on the west by the sea; extending about forty-seven miles in length, and twenty-five in breadth, and abounds in corn, wine, all kinds of vegetables, fine cattle, and every thing requisite for the comfortable subsistence of human life.

The road from the city of Pisa to that of Lucca, which are only twelve miles distant, is most delightful, especially in dry weather, when, instead of crossing over Mount St. Julian, one may keep along the plain. The country is divided into square inclosures, and planted with rows of trees, with vines twining round them, which luxuriantly intermingle their branches at the top, and form beautiful festoons. In summer and autumn nothing can exceed this delightful tract of land, the mountain which runs all the way on the right being covered with olives and cypress-trees of an extraordinary height.

Pisa, formerly a republic of considerable figure, reduced the islands of Sardinia and Corsica, conquered Carthage, drove the Saracens out of the city of Palermo in Sicily; maintained with honour a long war with Genoa, and subdued the island of Majorca, though Almeric king of Jerusalem sent forty ships to its succour. But in 1390 it was deprived of its liberty by John Galeazzo Visconti, duke of Milan; and in 1405 by the Florentines; but, by the assistance of Charles VIII. king of France, it recovered its liberty in the year 1494; however, being again reduced by the Florentines, in 1509, it has ever since remained in a state of subjection. The principal cities in this territory are Pisa and Leghorn; we shall begin with the former.

Pisa is a spacious city seated on the Arno, which divides it into two parts, in the forty-fifth degree thirty-seven minutes north latitude, and in the eleventh degree eighteen minutes east longitude, twelve miles to the north of Leghorn. The streets are straight, broad, and well paved, and the greatest part of the houses make a tolerable appearance; but the life and spirit that formerly animated this city, namely, the multitude of its inhabitants, are so far exhausted, that the grass grows in several of the streets. The most wealthy inhabitants, since the loss of its freedom, have withdrawn themselves, some of them to Genoa, and there is little appearance that this loss will ever be repaired; for though Pisa enjoys a healthful air, good water, a convenient and delightful situation for trade, and is encompassed by a fertile country, the inhabitants now scarce amount to sixteen or seventeen thousand, though in the eleventh century it is said they amounted to one hundred and fifty thousand; but, in the year 1615, they were reduced to fifteen thousand and sixty, including even the Florentine court. The university, which was founded in 1339, may be supposed to partake of the misfortunes of the city; though it wants neither colleges nor endowments, nor able professors, who are of the great duke's nomination.

The exchange is a superb structure, built in 1605, but is now almost desolate.

Some business, however, is still carried on in the city, on account of its being the place where the duke's galleys are built; and the few galleys of which his naval force consists, generally lie here.

Another circumstance of some little benefit to the city, is its being the chief seat of the order of St. Stephen. These knights are divided into *Cavalieri della Giustizia*, *della Grazia*, and *de Commanderie*. The last are those who, for the honour of wearing the cross of the order,

found a commanderie, which upon their death reverts to the order. In the second class are celebrated painters, and other eminent masters in the polite arts, on whom the duke confers this honour. These two classes are not obliged to make any vows; but the first, who are the proper knights of St. Stephen, swear allegiance to the grand master, who is always the great duke, and to serve against infidels. The proofs of noble descent must be the same as those required by the order of Malta. Their vow of chastity does not exclude marriage; but the unmarried knights have this advantage, that they live in the palace of the order, where they are elegantly lodged and provided with a splendid table gratis. The knights have the free disposal of their fortunes and incomes, of which a fourth part only devolves to the order, on their decease. On the festivals of the order, and other solemn occasions, they wear on their breast an octangular cross of crimson satin, embroidered with gold; but on common days, when they appear in public, they have only a plain white cross upon their cloak. The name of St. Stephen was chosen by Cosmo I. the founder of the order, from a signal victory he obtained, which entirely established the government of the Medicis, on the festival of that saint; whence St. Stephen's day is kept as the chief festival of the order. Their church is then hung with several hundred flags, and other trophies, taken from the infidels. The high altar is made of fine porphyry, and over it is a marble statue of pope Stephen.

The square before the church consists of stately houses, with the palace of the order, round which are the busts of the great dukes in white marble, and in the front a fine marble statue of Cosmo the Great.

The ducal palace has nothing magnificent, or suitable to that title. The market is ornamented with a white marble statue of the goddess of Plenty, standing upon a pillar, which serves both for a whipping-post and a pillory.

The archbishop's palace is a mean old building, with nothing remarkable but a fountain in the inner court, in which is a white marble statue of Moses, placed there, as an inscription says, on account of his rising from the water, and his rod having miraculously forced copious streams from a barren rock.

In the cathedral is a pair of large folding-gates of brass, on which is represented in relievo the life of Christ; but both the workmanship and design are very indifferent. On the side of the church are three entrances, with brass doors, on which are several historical pieces of the Old and New Testament in basso relievo, much superior to that mentioned above. The door frames are adorned with very curious festoons, and figures of animals, with the arms of the house of Medicis interspersed in several places. The middle portal is adorned with two columns of white marble, embellished with admirable foliages, and said to have belonged to Nero's baths. The frontispiece of the cathedral is a Gothic work, with innumerable pillars carved up to the very top. The number of pillars within the dome amounts to seventy-six, each of which is cut out of a single block of white oriental granate. The pavement before the high altar is of Mosaic work, made of small gems, representing a variety of figures. On each side of this altar stands an angel of bronze, admirably executed by Bonanno Pisano. The statues of Adam and Eve, on the altar of the Holy Sacrament, are greatly admired. The Baptistry is a large circular building with a high cupola; but it has no lantern, or any opening at the top, and is built all of white marble. The Last Judgment, represented in basso relievo on the pulpit by Nicholas Pisano, cannot fail of pleasing a curious eye. There are here eight pillars of oriental marble, each cut out of a single block. The large marble font is divided by four partitions, which shews that formerly baptism was here performed by immersion, and in the middle stands a bronze statue of John the Baptist. The concavity of the cupola is disposed in such a manner, that any noise made below is followed by a very loud and long double echo, which even exceeds that of Simonetti near Milan; but the repetition is not so clear and distinct. Two persons also, whispering, with their faces near the wall, opposite to each other, may converse together, without being overheard by the company that stand between them.

In

In the cathedral church-yard, near the choir, stands the famous leaning tower, detached from any other building; it is round, and ascended by three hundred and fifty-five steps to the top, which is enclosed with a breast-work, and in it hang seven bells. It is computed to be one hundred and eighty-eight feet high, and is divided into eight partitions, or stories, each surrounded with a colonnade of thirty-eight pillars, which in all the rows are of the same thickness; but decrease in length in proportion as they rise towards the top. The ground-floor is the only one without an opening between the pillars; but all the other stories form so many galleries round the tower. It is remarkable, that a plummet let down perpendicularly from the top, touches the ground at the distance of fifteen feet from the bottom of the tower. Its thus leaning has raised the admiration of travellers, some pretending that, by a peculiar art of the architect, it appears to lean on all sides, though in reality it inclines only on one, which is occasioned by nothing more than the sinking of the foundation: this is evident from the pedestals of the lowest row of pillars being sunk much deeper in the earth on the side of the inclination than on the other.

The Campo Santo, or the city burial-place, is an oblong piece of ground, and as the earth was brought from the neighbourhood of Jerusalem by fifty Pisan galleys, it is walled round with a building in the form of a cloyster, with marble columns and porticos, covered with lead at the top, and is divided by low stone-walls into three equal parts. In the uppermost lie the nobility, the citizens in the middle, and the peasants in the lowest part. On the walls of the cloysters are Scripture histories, painted by several hands, among which that of Job, in eight pieces, by Giotto, deserves particular notice. There is here likewise the life of the patriarch Joseph, in four compartments, and a very large representation of the East Judgment, in the middle of which is seen king Solomon hanging down his head, with all the signs of a guilty conscience. On our Saviour's left hand hell is represented, and on his right the mansions of bliss, crowded with monks and nuns: however, an angel is seen to take the freedom of dragging away a monk by the hair, as not qualified to be in such good company.

St. Matthew's church, which belongs to the Benedictine nuns, is a small, but very elegant, structure, remarkable for the perspective paintings in fresco on the roof; but the beholder must stand on a particular stone near the middle of the pavement, for that is the point of view from whence all the figures, pillars, &c. of the picture are distinctly seen in their proper arrangement.

There belongs to this city a very large physic-garden, well stocked with all sorts of curious plants and water-works, and near it is a museum of natural curiosities. The city is encompassed by a moat and walls; it is also defended by an old castle and large fort, but its citadel is a modern fortification. Between this city and Leghorn is a canal, sixteen Italian miles in length, and of great service for the convenience of trade and draining the morasses.

We now come to the city of Leghorn, by the Italians and other nations called Livorno, the antient Liburnus Portus, a handsome, but not very large, city, built in the modern taste, and with such regularity, that both gates are seen from the market-place. It is seated in latitude forty-three degrees thirty-three minutes north, and in ten degrees twenty-five minutes east longitude. In the north part are the finest houses, and from its being intersected with canals it is called New Venice. Leghorn was formerly a place belonging to the Genoese, and by them given to duke Cosmo I. in exchange for the town of Sarzana. It was then an inconsiderable place; but since that time it has put on a quite different aspect. The canals cut in several parts without the town, have rendered the marshes fit for culture, and in some measure dissipated the noxious effluvia, though the air is not yet esteemed perfectly healthful; and fresh water is so scarce, that they are obliged to bring it from Pisa.

The city is very well fortified, having two forts towards the sea, besides the citadel. The ramparts afford a very agreeable prospect of the sea, and of many villas on the land side; the number of guns in the several fortifications at present amount to about three hundred, most

of them of brass; and the garrison consists of six hundred men. The harbour is divided into the outward and inward, the last of which is called the Darsa, or Darsena, and is only appropriated to the great duke's galleys, which are about five or six in number, and are sometimes sent out upon a cruise against the Corsairs. The outward mole has a strong barrier of stones, of a vast size, upon which is a strong pavement, with a parapet wall running along the middle of it, where, on one side or the other, a person may be always sheltered from the wind. The length of the mole is six hundred common paces; but the breadth is said to be fifteen hundred. On this mole the wealthy inhabitants take the air in their coaches. One great defect in the harbour is, that in the middle it is too shallow for large ships, which on this account are moored to pillars and large iron rings on the side of the mole, by which means they are safer than in the harbour itself. The road, for an Italian mile or two towards the sea, is very good, though there is no security against the winds or Corsairs. The light-house, where every night thirty burning lamps are contained in one lantern, stands on a single rock in the sea; and not far from it, on the main land, is the Lazaretto, where quarantine is performed by persons coming from places suspected of infection.

On a building near the harbour, where the great dukes formerly resided, is an inscription to the following purport.

"Fly hither, ye merchants, with alacrity: this sacred place by its beauty, commodiousness, freedom, and plenty of all the necessaries of life, allures you: Cosmo III. the sixth great duke of Tuscany, who resides in this house, courteously invites you; having enlarged and fortified the city, he rebuilt this edifice, first raised by his grand-father Frederic I. and made it more superb and magnificent in the year 1695."

In the square before the Darsena is a statue of duke Ferdinand, with four Turkish slaves, in bronze, of a gigantic size, in chains.

The number of inhabitants is computed at forty thousand, among whom are twenty thousand Jews, who live in a particular quarter of the city, have a handsome synagogue, and, though subject to very heavy imposts, are in a thriving condition, the greatest part of the commerce of this city going through their hands. The generality of the Greeks and Armenians settled here, acknowledge the pope's supremacy, and each have their peculiar church. The free Turks and the Turkish slaves have a mosque, but the protestants are not permitted the public exercise of their religion, the English excepted, who being of all foreign nations the best customers to Leghorn, are allowed to have a chaplain, while the other protestants make use of the chaplains of ships. None of the churches in Leghorn afford any thing worth the curiosity of a judicious traveller.

As particular quarters of the city are assigned to the Jews and Turks, so the public prostitutes have theirs also, consisting of two or three streets, which bounds these unhappy creatures are not to pass, without previous leave from their commissary, and paying a trifling sum.

The port is entirely free for commerce to all nations, and the duties on imported goods are so easy as not to cause the least obstruction to commerce; every bale, let the size be what it will, pays only two piasters, or nine shillings sterling; nor are the contents examined. Travellers are not troubled at Leghorn about searching their baggage; they are only obliged to deliver up their pistols, and other fire arms, till they obtain an order from the governor to have them restored, which is also attended with very little difficulty.

Leghorn, after all, is far from being a cheap place to live at; for though strangers pay little or no taxes, yet the provisions and other necessaries, brought thither by land, are subject to very high duties; and the duke reserves to himself the monopoly of several commodities, particularly brandy, tobacco, and salt; and Mr. Addison informs us, that in his time, the person who had the monopoly of selling ice at Leghorn, paid annually above one thousand pounds sterling for that privilege, and the tobacco-merchant ten thousand pounds. All the

com-

commodities that are sent up into the country are clogged with impositions as soon as they leave Leghorn; and all the wines, oils, and silks brought from the fruitful valleys of Pisa, Florence, and other parts of Tuscany, are obliged to pay several duties and taxes before they can reach the port.

The Turkish slaves and other galley-rowers are every night secured in a large place surrounded with a high wall, called the Bagni, in imitation of the Moors, who give this name to a prison in which they keep the Christian captives. In the day-time they are set at liberty, and may exercise their industry either in labour or trade; but they must take care to return in due time to the Bagni. They lie here singly in long barracks, the beds being in five or six rows over each other, with rope ladders to ascend to them, and nothing is punished with greater severity than when two are found in one bed: for the better preventing all disorders, lamps are kept burning, and a watch is continually walking about the barracks. The three classes of rowers are the volunteers, the criminals, and the Turkish slaves, who have each their respective wards; in other respects no distinction is made, and one sick ward and dispensary serves indiscriminately for them all. The number of these galley-rowers is generally about two thousand, and of these the Turks make eight or nine hundred.

S E C T. IV.

The SIENNESE.

Its Situation, Extent, Produce, Government, and History; with a Description of Sienna, and the Customs and Manners of the Inhabitants. A concise Account of the States of Presidii and Piombino.

THE Siennese is bounded on the north by the Florentino; on the south by the Mediterranean sea and the duchy of Castro; on the east by the Perugino and Orvietano; and on the west by the Florentino and the Tuscan sea, it being about fifty-five miles in length, and as much in breadth.

The country is pretty fertile, especially in mulberry trees, which feed a great number of silk-worms, and there are several medicinal springs.

The Siennese flatter themselves with retaining a kind of liberty in the election of their senate, which consists of nine persons called *Eccelsi*, whose president is stiled captain of the people; but this is only an external shew, the senate being so far under the check of the great duke of Florence, that no measure of any consequence must be taken without his knowledge and permission.

Sienna was at the time of the long interregnum a free state; but has since been thrown into frequent convulsions, by the ambition and intestine broils of the principal families, especially the Malatesta and Petrucci. In the year 1554, the emperor Charles V. reduced them entirely under his dominion, and at his resignation in 1556, the sovereignty devolved to his son Philip II. king of Spain. This prince afterwards, in consideration of a large sum of ready money, and a promise that they should not take part with the French, ceded the country to Cosmo I. duke of Florence; but reserved to himself some maritime towns, as Piombino, Orbitello, Telamone, Porto Hercole, Porto St. Stefano, Porto Longone, with the isle of Elva, which constitute what is called Stato de Gli Presidii, from the Spaniards keeping garrisons in those towns.

The principal city in this territory is Sienna, which stands thirty-six miles to the south of Florence, and fifty-nine to the south-east of Leghorn. It is pretty large, and pleasantly situated on three hills, which render the streets very uneven; but this is compensated by the agreeableness of the prospect, and the exceeding healthfulness of the air. The houses are elegant, but thin of inhabitants, who scarce amount to seventeen thousand. They are civil and of a chearful disposition; the women have their share of beauty, and have more freedom than in many other parts of Italy. Several of the nobility, who are divided into classes called *Monti*, choose it for their residence, and on this account Sienna is famous for

the purest dialect of the Italian language. It is the see of an archbishop, and the cathedral is incrusted both on the outside and within with marble. The pavement is admirably inlaid with marble and other costly stones, especially under the grand cupola, and before the great altar, where many scripture histories are represented in this manner with all the delicacy of painting; but this part is covered with boards in order to preserve it, and a foreigner is only shewn some feet square. In this church are the busts of one hundred and seventy popes, in plaster of Paris, six of whom were natives of Sienna, and the twelve apostles have marble statues. The roof of the whole church is painted with azure, and, as it were, strewed with golden stars.

Through an aperture in the pavement of the choir one may look down into St. John's church, which lies directly under the cathedral, and there is an entrance to it at the foot of the ascent. This singularity is occasioned by the uneven and hilly situation of this city. Near the cathedral is the archbishop's palace, and opposite to it a large and well endowed hospital, founded by a shoemaker, who lies buried in a church belonging to it, and, in return for his liberality, was canonized, and has a statue erected to his memory.

The Jesuits church is, as usual, very fine, and adorned with a great many marble statues. That of the Augustines is worth seeing for the admirable sculpture on the high altar. On each side of the tabernacle stands an angel of white marble, holding a lighted taper in his hand.

The head of St. Catherine of Sienna, which one of her countrymen, upon her dying at Rome, out of a pious zeal, is said to have severed from her body, and brought to Sienna, is kept in the church of the Dominicans with the greatest veneration, and is exhibited to view only twice a year. On the high altar of this church are two admirable statues of Mary Magdalen and Catherine of Sienna, the latter of whom has a fine chapel here, painted by Sodorno. The Dominicans here pretend to shew the ring given her by Christ at the solemnization of his espousals with her, which are profanely said to have been performed with celestial splendor, while king David graced the solemnity with the music of his harp. The house in which they say she lived with her parents is now an oratory, and her private chamber is converted into a chapel, profusely adorned with stucco-work, gilding, sculpture, and painting.

Not far from the Dominican church is a remarkable bridge, extending from one hill to another across a street; but the inconsiderable height of this bridge does not admit of any buildings under the arches like that of Genoa. This city has an university, founded by Charles V. but it is in a declining condition. The German students enjoy particular privileges, which they derive from the same emperor; but in the Jesuits College is a considerable number of scholars. In the fifteenth century the Academy of the Intronati was founded here.

The Senate-house is scarce worth seeing; before it indeed is a large square called the Branda, resembling a dish, or rather shell, which it is pretended in case of fire, or for a mock sea-fight, may be laid under water, by means of the city fountain. On one side of this square stands a tower called the Mangiana, remarkable for its chimes, which, however, never play but on extraordinary occasions; it derives its name from a statuary, who made several statues erected upon it. Before the Senate-house is a fine marble fountain by Giacomo della Quercia, a sculptor of this city.

The arms of Sienna are Romulus and Remus sucking a she-wolf, and as such they are to be seen in several parts of the city; particularly on a pillar of ophir fronting the Senate-house. Sienna, indeed, boasts of being a colony founded by those celebrated brothers, but cannot support its claim by any satisfactory proof.

The Siennese also contains a number of small towns; and in the Tuscan sea are the islands of Melora, Gorgona, Pianosa, Le Formiche, Monte Christo, Giglio, and Gianuti; all of which belong to the duchy of Tuscany.

We now come to the small and inconsiderable states of Presidii and Piombino, with which we shall conclude this section.

The former of these states, which lies as it were scattered near the sea, formerly belonged to Sienna; but Philip II. king of Spain, as we have already intimated, on transferring the district of Sienna to Cosmo I. excepted this tract, which thus continued annexed to the crown of Spain, till in 1707, the greatest part of it, with the kingdom of Naples, was conquered by the Imperialists; but in the peace of 1736, this tract was yielded to Don Carlos, king of both Sicilies.

The state della Presidii, or of the garrisons, from its being garrisoned by the troops of the king of the Two Sicilies, contains the following places, Orbitello, Telamone, Argentaro, Porto Hercole, Monte Filippo, and Porto St. Stefano.

Orbitello, the capital, stands near the Tuscan shore, at the foot of Mount Argentaro, on a lake formed by an arm of the sea, which serves for a good harbour, having a narrow entrance between two capes. It is strong both by art and nature; being almost surrounded by the lake, which is eleven or twelve miles in compass, and having no communication with the continent, but by a narrow causeway that may be easily broken; and it is defended by some good forts.

The other towns, just mentioned, are only small fortified places.

The principality of Piombino is a small territory lying along the sea-coasts, between the Siennese on the east, and the Pisano on the west. It was formerly part of the republic of Pisa, from which it passed into the family of Appiani, who took the title of princes of Piombino; but the last male heir dying without male issue, the emperor conferred it as a fief on others.

The town of Piombino stands on a rock in the sea, and is defended by a citadel and castle; it was built out of the ruins of the ancient city of Populonia, but makes no great figure at present.

There are several other small towns in this district, some of which are fortified; and opposite to Piombino is the island of Elba, which is separated from the continent by a channel; it is small, and with all the turnings and windings of the shore, which is very uneven, is not above forty miles in compass. It is very mountainous, and affords iron, lead, and sulphur, with quarries of marble. It has two fortresses, namely, Porto Longone, garrisoned by the Spaniards, and Porto Ferrario, which belongs to the duke of Tuscany.

SECT. V.

Of the ECCLESIASTICAL STATE.

Its Situation and Extent. The Reason of the Poverty and Want of Inhabitants in the Pope's Dominions; the Prerogatives claimed by the Pope; his Power not derived from St. Peter; the Rise of the Cardinals, and their Manner of choosing the Pope; the Offices of the Government and Courts of Justice, with the Revenues, Military and Naval Forces of the Pope.

THE Ecclesiastical State, or the territories of the pope, is bounded on the north by the dominions of Venice; on the east by the Adriatic: on the south-east and south by the kingdom of Naples and the Mediterranean; and on the west by the grand duchy of Tuscany and the territories of Modena; extending from south to north two hundred and forty miles, and from the south-west to the north-east, in some parts, one hundred and twenty, but in others scarce twenty.

Mr. Addison, Dr. Busching, and other authors observe, that on considering that the pope's dominions generally consist of a very fertile and excellent soil; that his harbours, both on the Adriatic and the Mediterranean seas, are very advantageously situated for trade; that he receives considerable sums out of Spain, Germany, and other countries, that belong to foreign princes, which one would fancy might be no small ease to his subjects; that his country is visited by numbers of foreigners, who spend a great deal of money in it; and that on account of the supposed sacredness of his person and character, his government should seem most eligible and best calculated for the welfare of subjects: on considering

all these particulars, and the long peace that has reigned in Italy, one would be apt to imagine that this country could not fail of being extremely flourishing; but upon the slightest inspection the very reverse is manifest.

The country is but ill cultivated, poor, and thin of inhabitants, the city of Bologna alone excepted. Trade and manufactures are entirely stagnated, and were it not for the bounty of Providence, which furnishes the inhabitants with dates, figs, almonds, olives, and other fruit, which grow spontaneously, and without culture, their sloth would absolutely starve them. Their little inclination and spirit for work is the less wonderful, as they are conscious that if they have much, much will be taken from them. The many holidays, which are an impediment to trade and business, and the great number of young sturdy beggars, strolling about, under the title of pilgrims, instead of increasing the common stock by their labour and industry, lie as a dead weight on their fellow-subjects, and consume the charity that ought to support the aged, the sick, and the decrepid.

The multitude of convents, which are like so many nests of drones, that hinder the increase of inhabitants; the many hospitals that confirm the people in idleness; the inconceivable wealth in the churches and convents, which lie dormant, without the least advantage to the public; and the inquisition, which will not permit the want of inhabitants to be supplied by those of another religion, are some of the great causes of the wretched condition of the papal dominions; though there are others attended with still more fatal consequences. No christian government equals the papal in rigour, the temporal sword being not only used, but, on several occasions, the spiritual. Nothing is so monstrous as the passion by which most popes, cardinals, and other great prelates, have been carried away for enriching and promoting their nephews and relations, and nothing is so vain as the ambition of gaining a great name by founding churches and convents. The regulars vie with each other in the number, splendor, and riches of their religious houses and churches; but it is from the bowels of the poor inhabitants that the money is generally extracted for the support of their frivolous rivalry. The legates, governors, and other inferior officers in the provinces, knowing that the time in which they can enjoy their posts is but short and uncertain, scruple no kind of rapaciousness. On considering these various causes, we shall no longer be surprized that in no part of Europe there is a more wretched people than the pope's temporal subjects.

According to the canon-law, the pope is the supreme, universal, and independent head of the church, and invested with sovereignty over all christian communities, and every individual member. He has a right to prescribe laws to the whole world. What he does is as if God himself had done it, he being god upon earth. All sovereigns must pay homage to him. He may depose both disobedient and ill-governing princes, and give their dominions to others. He has a right to examine any person promoted to a kingdom, and may require an oath of allegiance from him. On the vacancy of a throne the government devolves to him. He has the right in all states to use both the temporal and spiritual sword. If a prince be remiss in his government, he may appoint him a colleague, or substitute another in his stead. He can legitimate children born out of wedlock, and thereby make them capable of succeeding to a throne, &c. This is a short sketch of the extravagancies of the political system of the court of Rome, which, notwithstanding its impiety and absurdity, has been ambitiously obtruded on the world, and even was for some ages tyrannically put in practice. It is chiefly owing to the Reformation that these corrupt maxims are at present, by the rational part of Christendom, treated with contempt, and that the pope has lost a great part of the formidable power he has vainly and arrogantly assumed, which has reduced his power even among those princes who own his authority, and several of them seem to consider him less as a spiritual father than as a temporal prince. Hence many of the abuses with which the reformers justly charged the court of Rome, have been either

ther quite set aside, or managed with more art and policy. Princes, instead of being treated with threats and anathemas, are addressed with great civility and submission: the clergy and monks are become more learned and moderate, and though they have have lost none of their zeal for reducing protestants to their church, yet in general they do not use so much violence and cruelty as they formerly did, except in a few countries more bigotted than the rest; nor do they treat those who dissent from them with such uncharitable language and virulence. Protestants, of all sorts, are used with more humanity in those countries, and the learned of all religions hold an epistolary commerce with each other, with the utmost seeming friendship and candour.

Dr. Busching observes, that the papal territories are far from being derived from the poor and disinterested apostle St. Peter, who, according to the groundless opinion of the church of Rome, is said to have been the first bishop of that city; but have been procured and annexed to that see much later. It is equally false, he adds, that the emperor Constantine the Great, in the year 324, made a grant to Sylvester bishop of Rome, of that city and St. Peter's patrimony; as it is called. This fable was first mentioned by Isidorus Mercator, and is probably nothing better than his own invention. However, the pretended instrument of donation is alone sufficient to place in a clear light the ignorance and audaciousness both of its forgers and partizans. Certain it is, that the bishops of Rome gradually procured for themselves several estates and lands, which, particularly in the year 755, received a very considerable increase; Pepin king of France giving the whole exarchate to the see of Rome, and his son Charles not only confirming that gift, but making three several additions to it. No mention was made, till some time after this, of the supposed gift of Constantine to Sylvester. Rome was still reputed subject to the emperor, the king of the Franks retaining the temporal sovereignty of the places which had been granted to the popes. But under Charles's successors the popes, finding opportunities of increasing their power, at last arrogated to themselves the disposal of the empire. In the following ages they took all measures for raising their see to an astonishing and formidable greatness, which proved highly detrimental both to the welfare of Europe, and the cause of religion. How the several parts of the papal territories became annexed to the see of Rome, we shall hereafter shew in the description of those parts.

The pope is chosen from among the cardinals, and before we describe the manner of his election, it will be proper to take some notice of them. The word cardinal was a name anciently common to the presbyters and deacons of great churches in cities; but in the eleventh century the presbyters and deacons of the church of Rome restrained the appellation to themselves, and their power encreased with that of the pope. The first dawn of their grandeur appeared under pope Nicholas II. Innocent IV. at the council of Lyons in 1243, gave them the red hat, Boniface VIII. the red vestments, and Urban VIII. the title of *Eminentissimi*, but before they were only stiled *Illustissimi*. Sixtus V. at the council of Basil, fixed their number at seventy, which is seldom complete. They are divided into three classes: these are six cardinal bishops; namely, the bishop of Ostia, dean of the sacred college; the bishop of Oporto, sub-dean; and the bishops of Sabina, Palistrati, Fregati, and Albano. These bishoprics may be held with other bishoprics or archbishoprics. The second class consists of fifty cardinal priests, and fourteen cardinal deacons; each of the cardinal priests and deacons bears the title of a church in the city of Rome. The cardinals insist on precedency before the electors of the empire, and of being treated on the same footing as crowned heads. Indeed the title of cardinal has no revenue annexed to it; but embassies, the protection of Roman catholic nations, governments, archbishoprics, bishoprics, prelacies, and other ecclesiastical benefices, enable them to live in state, though not suitably to the rank they assume, especially when, being of mean extraction, they have no fortune of their own.

The conclave is the theatre on which the cardinals principally endeavour to give proofs of their genius and

address. The decease of the pope is made known to the people of Rome, by tolling the great bell of the capitol, firing the cannon of the castle of St. Angelo, and opening the prisons; and soon after circular letters are sent to foreign cardinals by the cardinal cammerlingo to invite them to the approaching conclave. Mean while the cammerlingo acts as regent, is attended by the pope's life-guard, and orders every thing necessary for opening the conclave, which is held in the galleries and some of the anti-chambers of the Vatican, and consists of a number of small rooms separated by wooden partitions, and distributed by lot, both among the cardinals then in Rome, and those that are absent. Each has usually two, one for himself, and one for two attendants called conclavists.

On the eleventh day after the pope's demise all the cardinals in the city meet in the morning at St. Peter's church, where the mass *Sancti Spiritus* is celebrated; and after a sermon on the duties to be observed in the election of a pope, they proceed two by two into the conclave, which is then shut up by the governor and marshal of the conclave, none being let out, unless in case of illness, till a new pope is elected, and the person so let out is not allowed to return. The governor of the conclave is always previously chosen by the cardinals, and, together with the marshal, resides at the entrance of the Vatican, and without their express licence no person is suffered to go in or out.

While the cardinals sit in conclave, refreshments are brought them in baskets, or boxes, which are searched, though not with much strictness. Each cardinal orders his conclavists to write down on a slip of paper, the name of the person to whom he gives his suffrage. This is thrown into a chalice on the altar of the chapel of the conclave, and two cardinals appointed for that purpose successively read aloud the notes, marking the number of votes for every cardinal. He who has two-thirds is declared pope; otherwise the scrutiny is repeated till this number is complete. If this manner of election does not take place, recourse is had to another, called *Accessus*, whereby the notes of the former scrutiny being set aside, every cardinal must give in writing his vote to another, and if by this way two-thirds do not appear, there is still another resource called *Inspiratio*, in virtue of which, those of the cardinals who are unanimous, come out of their cells and call aloud to each other, "Such a one shall be pope, such a one shall be pope:" upon which, others, to avoid incurring the displeasure of the new elected pope, frequently join in the cry, and thus the election is sometimes carried; but if this also fails, the scrutiny begins again, and a conclave in this manner, sometimes proves a long-winded business.

The emperor, with the kings of France and Spain, are allowed to exclude a person proposed for the pope-dom; but this protest must be made before the complete declaration of the votes for such a person. It is required that the pope be an Italian, and at least fifty-five years of age, though the age mostly insisted upon is between sixty and seventy. When the election is over, and the pope elect has declared what name he will bear for the future, the chief of the cardinal deacons proclaims him to the people. His coronation with a triple crown is generally performed eight days after.

The governor and magistrates of the city of Rome are, during the conclave, invested with the interregnum.

Each pope may choose his arms. The papal court is numerous and splendid. The posts of cammerlingo, prime minister, upper confessor, secretary of state, datary, and vice-chancellor of the holy church, are filled by cardinals. Some officers are removed at the pope's decease, as the secretary of state, the upper confessor, &c. while others, as the cardinal cammerlingo, vice-chancellor, &c. continue in office.

The pope's high council is formed of the consistory of cardinals, and its ordinary meeting is once a week in the papal palace; but the extraordinary meetings depend on his holiness's pleasure. Here are discussed all the temporal and spiritual affairs of the papal see, as the filling up of vacant archbishoprics, bishoprics, prelacies, abbacies, &c. Every nation of the Romish religion has

a cardinal for its protector. The inferior colleges are called congregations; as the congregation of the sacred office or inquisition; the congregation *de propagandâ fide*, and those of religious ceremonies and the candidates for ecclesiastical benefices. The cardinals preside in these congregations. The *rota Romana* is a kind of supreme court of appeal, where also every popish nation has one or two assessors. The *dataria* is the chancery, and is so called from the usual signature, *Datum Romæ apud Sanctum Petrum*, &c. when the pope lives in the Vatican: and *Apud Sanctam Mariam Majorem*, when he resides at the Quirinal.

The revenues of the pope are very large, as those of the countries of which he is sovereign as a temporal prince are considerable. No person in Rome must sell any wine or fruit till the pope and his nephews, with their dependants, have disposed of what is consigned to them from their domains and estates. The annates of the great consistorial benefices, the pallia, and investitures of archbishops and bishops, the jubilee year, indulgences, dispensations, canonizations, promotions of cardinals, subsidies of the clergy, convent collections, &c. continually bring vast sums into the papal treasury, from all Roman catholic countries. The annual income of the pope is generally computed at eight millions seven hundred thousand scudi. This revenue is under the management of the apostolic chamber, where the offices are so lucrative, that some of the principal are sold for eighty or a hundred thousand dollars; yet in the year 1741 the apostolic treasury was indebted no less than fifty-six millions of scudi.

The pope's soldiers are by no means despicable; but they have seldom good officers. They are both well clothed and paid, and are augmented or reduced as circumstances require. His body-guard consists of forty Swiss, seventy-five cuirassiers, and as many light-horse; but his galleys, which lie at Civita Vecchia, are of small consequence.

In the papal territories are five legations or principal governments; these are Bologna, Urbino, Ravenna, Ferrara, and Avignon. At the last place the legate never resides in person; but is represented by a vice-legate. The post of legate is only triennial. The other countries belonging to the pope are under ecclesiastical governors, and the administration is every where despotic, Bologna alone excepted.

We shall now proceed to describe the several countries subject to the pope, with the principal places in each. These countries are the duchies of Bologna, Ferrara, Romagna, and Urbino, the marquisate of Ancona, the territories of Perugia and Orvieto, the duchies of Spoleto and Castro, St. Peter's patrimony, and the Campagna di Roma, or territory of Rome.

SECT. VI.

The BOLOGNESE, or Duchy of BOLOGNA.

Its Situation and Produce, with a minute Account of the Bononian Stone: Its History, and a particular Description of the City of Bologna, and of the Trade, Manners, and Customs of the Inhabitants.

THE Bolognese is bounded by the Ferrarese on the north; by Romagna on the east; by Tuscany on the south; and by Modena on the west; and is watered by a great number of small rivers, which render the soil extremely rich and fertile; but it is far from being either populous or well cultivated. The country abounds in all kinds of fruit, especially quinces, olives, and grapes. The quinces, in particular, are remarkably large, and of an exquisite flavour. The whole territory is said to contain three hundred and eight towns and villages, and three hundred and eight thousand souls.

Among the natural curiosities of this country is the famous Bononian stone, found about the Appennine mountains, and in mount Paderno, four Italian miles from Bologna; also in several other parts of Italy. It is commonly of the size of a walnut, of a light-grey colour, the surface uneven, impregnated with sulphureous particles, and not very compact, though heavier than

one would imagine from its size, and in many parts of it sparkling like talc. After a heavy rain has washed the earth down from the mountains, it is easily found. Before it is properly prepared it appears in the dark like another stone, but, by a particular calcination, it acquires the following property: that after lying in open day-light, it absorbs so much luminous splendor as to shine in the dark, like a glowing coal, for eight, or even fifteen minutes, and when the stone is very good, its lustre resembles that of a flambeau. The moon-shine makes not the least impression on it, and the sun-beams are too strong for it by calcining it too much, so as to crumble it to powder. It retains also its luminous quality when laid in water; and in general it lasts three or four years, at the expiration of which, or at any other time, it may be calcined anew to recover its quality; but it never becomes so luminous afterwards.

This country formerly maintained its independency as a republic, under the protection of the emperor; but in the year 1278, subjected itself in some measure to pope Nicholas II. In succeeding times it underwent several revolutions, till pope Julius II. on occasion of the Venetian war, annexed the city of Bologna, and all its dependencies, to the papal dominions in 1513. The city having freely submitted to the Romish chair, its various privileges have been preserved, and it still enjoys those of sending an envoy to the court of Rome, of having an assessor in the Rota, that no citadel must be built at Bologna, and that the effects of the citizens shall not be taken from them, upon any pretence whatsoever. In memory of their former state the word *LIBERTAS* is stamped on their coin.

The temporal government is under a cardinal, who has the title of legate a latere, and has a prelate, or vice-legate, under him. The legate himself is either changed or confirmed every three years.

The principal city in this territory is Bologna, in Latin *Bolonia*, antiently *Felsina*, which is, next to Rome, the best and richest city in all the Ecclesiastical State. It is situated in forty-four degrees thirty minutes north latitude, and in the eleventh degree forty minutes east longitude, two hundred miles to the north-west of Rome, and is of considerable extent, it being five or six Italian miles in circumference, and so populous, that its inhabitants amount to upwards of eighty thousand. It is seated at the foot of the Appennine mountains, in a fertile plain, and enjoys a wholesome air. The river Savona runs by the walls, and the Reno through the city. Among the houses are many fine buildings. In most of the principal streets they have a kind of portico, which supports the second story. These must be allowed to be very convenient in windy or rainy weather, and in shading the rooms from the sun; but they deprive them of the ornaments they would receive from a fine front, and an elegant entrance. As the pillars of those porticoes are very irregular before different houses, some being high, others low, some square or octangular, others round, some of stone and others of wood, they are of no great ornament. These porticoes, or galleries, serve only for walking, and that part of the street where the carriages pass, is considerably lower, and, in short, they resemble those of Chester. The roofs of the houses, though flat, are covered with tiles, with a kind of parapet towards the street.

The palace in which the vice-legate, the gonfaloniere, and other officers of state have their apartments, and the several boards and courts of justice are held, stands in the great market-place, and the front is two hundred and eighteen common paces in length. Over the entrance is a brass statue of pope Gregory XIII. who was a native of Bologna; it weighs eleven thousand three hundred pounds, and the workmanship does great honour to Minganti, the artist by whom it was made. On the left hand on entering the door is the statue of pope Boniface VIII. Among the apartments shewn to strangers is one called *il Salone d'Ercole*, where may be seen a noble statue of Hercules, of an uncommon size: it is of terra cotta, by the skilful hand of Lombardi. In another saloon is represented, in fresco, the most considerable achievements of the Bolognese, inscribed with Latin verses. Above this apartment is the *Sala Farnese*, so called from a marble statue

Festival or Sacrifice in Honour of Confucius.

statue of pope Paul III. who was of the family of Farnese. The cieling and walls of this apartment were painted by the best masters in Bologna, at the expence of cardinal Farnese, among which is the public entry of Paul III. into Bologna.

The Aldrovandi museum is kept in this place with such care, that it is never opened but in the presence of a senator, and consists, among other curiosities, of one hundred and eighty-seven folios, and above two hundred bags full of single leaves, all written by the indefatigable hand of Aldrovandi. This collection has been enriched with the cabinet of the marquis Cospi, which contains a great number of valuable medals. In this place are also kept the military stores and artillery, with arms for six thousand men. The physic-garden in the court is very small, and has nothing remarkable.

The area before the palace is three hundred and seventy feet long and three hundred broad, in which is a fountain that is much admired: the statue of Neptune on the top is eleven feet high. Within the basin are a great number of dolphins ejecting water, and four women with three streams issuing out at each breast. The only exception to this superb work is, that the jetteaus are in no proportion to the size of the figures.

A connoisseur in painting will meet with a great deal of entertainment in the palaces of the city: that which most gratifies a traveller's curiosity is the palace of Caprara, where he cannot but admire the double stair-case, the tapestry hangings, and the richness of the other furniture. Here are particularly many small coffers of admirable Florentine work, one that has six large and as many small pillars of rock crystal, several curious works of ivory and wood. In the gallery are some fine paintings, among which is the death of Bragadino, who was flayed by the Turks, painted on wood.

On the cieling of a saloon of the palazzo de Favi are the adventures of Jason in eighteen pieces, by the two brothers Augustino and Annibal Caracci. In another apartment are painted on the frieze twelve passages of the Æneid in fresco, by Luigi Caracci. The rest of the adventures of Æneas are painted in ten pieces by Albani; under the direction of Luigi Caracci, and his other disciples have finished the remainder; but the latter are in a different apartment, and under every picture is a Latin verse out of the Æneid, explaining the subject. Several other fine pieces of painting are likewise to be seen in this palace, and particularly some very delicate drawings with a pen.

The palazzo de Monti shews the genius of the Italian nobility for adorning their palaces with collections of paintings and other curiosities; who often abridge themselves of many of the conveniencies of life, in order to be possessed of something that attracts the admiration of other people, and especially of foreigners. The first floor of this grand edifice, consisting of above thirty apartments, which are by far the best, is never, or at least very seldom, inhabited, and then only for the reception of some person of distinction; their general use being only to display an amazing collection of paintings and other curiosities. Besides the many pieces by Albani and the Caracci's, here is a gallery painted by young Cignani, with a large piece of painting representing the raising of the siege of Turin, by Antonio Casa. In another apartment is to be seen a woman asleep, with a wanton boy laughing, while he lets down a mouse, hanging by a thread, upon her breast. In this piece the expression is very strong, and the mouse is admirably done.

The palace of Ranucci is built in a grand taste, with a noble stair-case, and spacious lofty rooms. Here is some beautiful tapestry, made at the Gobelins, and several closets full of Florentine work, silver vases, and other furniture, particularly a clock of raised inlaid work of gems, on a ground of lapis-lazuli. The height of the chapel takes up three stories of the house. Among the paintings in this palace are St. Jerome, and Joseph flying from Potiphar's wife, by Guido; the fall of Haman, by Antonio Gionima, where the beautiful figure of Esther is particularly admired; and the portraits of the great dukes of the family of Medici.

We shall now take notice of some of the ecclesiastical buildings at Bologna, and shall begin with the cathedral,

which is dedicated to St. Peter, and has a great number of monuments. On each side of the main entrance is a large lion couchant of red marble, on each of which is placed a basin of holy water. On the center arch, near the Tribuna, is a marble statue of pope Gregory XV. who was a native of Bologna. On the cieling of the chapter-room is a fine piece of painting by Luigi Caracci, representing St. Peter on his knees before the Virgin Mary: here is also the Annunciation, by the same hand, which was the last piece he painted.

St. Agnes's church is finely gilt and painted, and among the pictures is the martyrdom of St. Agnes, over the high altar, which is one of Dominichino's pieces.

In St. Anthony's church, over the great altar, is an admirable piece by Luigi Caracci, representing the preaching of the primitive hermits. On another altar is a picture of the Virgin Mary and her Divine Infant, with a group of angels hovering over her. In the oratory or small chapel near this church is a most beautiful piece representing the Annunciation, by Tiarini.

Before St. Bartholomew's church stands a marble statue of St. Petronius, by Brunelli. This church is divided into three isles, and that in the middle is of a remarkable height. All the three make a fine appearance, and are excellently painted, particularly that on the south side. Angelo Michael Colonna, as is mentioned in an inscription, from a motive of devotion, performed this grand piece, and some others, without any reward. The high altar is of beautiful marble, with some figures inlaid. The Annunciation by Albani is accounted an incomparable piece, and nothing can surpass the expression of the Virgin's admiration. Two other pieces representing the nativity, and the flight to Egypt, are also by the same master.

In the church of St. Petronius, the biggest in the whole city, is to be seen the celebrated meridian line of Cassini, which consists of pieces of red and white marble inlaid, of a hand's breadth; but those pieces in which the signs of the Zodiac are cut, are a foot square. This line is above half the length of the church, and at the beginning is a Latin inscription, which says, that the whole length of this line, which is said to be one hundred feet, is the six hundred thousandth part of the circumference of the terraqueous globe. In the arched roof of the nave is a hole directly over the noon point of this line, through which a ray of the sun entering, marks the solstices and equinoxes upon the line. However, the same operation may without much difficulty be performed in any other convenient place; the whole mystery consisting only in measuring the degrees on the line proportionably to the height of the hole through which the rays enter.

Madonna di St. Luca, on the Monte della Guardia, is a Dominican nunnery about four Italian miles from Bologna, and is much resorted to on account of a picture of the Virgin Mary, pretended to have been painted by the hand of St. Luke: on which account it is every year brought into the city in a solemn procession, with more than ordinary magnificence, attended by the firing of cannon, the several companies of artizans, the fraternities, monks, heads of the parishes, the magistrates, the gonfalonier, and the legate himself. The picture is always carried under a rich canopy, the people upon their knees saluting it as it passes by, with the most zealous ejaculations that can be conceived. For the greater convenience of the pilgrims, an arched colonnade has been built from the city to the top of the mountain, which on account of its great length may be justly esteemed the most remarkable building of that kind in Italy. In the contribution of the necessary sum for this colonnade, all the handicraft men, &c. seemed to vie with each other in the erection of a perpetual monument of their zeal for the Blessed Virgin; even the very lacquies of the city were at the expence of building fifteen of the arches. On each of the arches are the names and arms of the benefactors. One side of the arcade is walled, but in that towards the road, every arch rests upon its respective pillars. Every arch is five common paces, or twelve feet wide, which is also the breadth of the walk. The height is about sixteen feet. This arcade does not run in a straight line; but its direction is now and then interrupted with small windings,

windings, yet in many parts there are very long vistas, particularly at the grand portico near the city, from which one has a view of ninety-three arches in a direct line, which taken together are seven hundred and fifty common paces in length. There are thirty-three flights of steps to ascend the acclivity of the mountain; these flights consist of a few steps, and the space between is level and paved with flat stones.

A continual emulation reigns between the Franciscans and Dominicans, especially at Bologna; each of these orders striving to surpass the other in buildings and other external magnificence, in order to increase their revenue and authority. The Dominicans have the advantage in the splendor of their churches; but in wine cellars they have been hitherto exceeded by the Franciscans. The church of the latter is adorned with many highly finished pieces of painting, and on each side of the convent are fine arched cloisters, one of which is one hundred and thirty-three, and the other two hundred common paces in length. In the street before the convent is a pillar, on the top of which is a brass statue of the Virgin Mary, standing on a crescent.

In the Dominican convent are about one hundred and forty monks. An anti-chamber, divided into three isles, leads to the library, and on each side are statues and paintings in honour of the Dominican order, and pope Pius V. The books are very numerous, and judiciously disposed. In the lower cloister of the convent is a small chapel, said to have been the apartment in which St. Dominic, in the year 1221, departed this life. In one piece of painting in this chapel is an angel represented going up a ladder to heaven with St. Dominic on his back; but that the angel and St. Dominic may not have the ill manners of turning their posteriors towards the people, they ascend the ladder backwards. Another circumstance no less absurd, is our Saviour and the Virgin Mary standing above, holding the ladder.

Here is an university, in which are professors for oratory, philosophy, geometry, astronomy, anatomy, divinity, physic, the oriental languages, the civil and canon law, civil and ecclesiastical history, and all of them have handsome salaries. The foreign students amount to about four hundred. The public college is two hundred and thirteen paces in length. Near its entrance on the right hand is a grand stair-case, adorned with some good paintings in fresco, representing the noble actions of St. Carlo Borromeo, and other pieces. The anatomical theatre is adorned with wooden statues of the most celebrated anatomists, and the floor is boarded with cy-presses.

In the year 1712, Luigi Ferdinando de' Medici instituted at Bologna an academy of sciences, for the improvement of natural history, mathematics, natural philosophy, chemistry, anatomy, and physic. With this the Clementine academy, founded by pope Clement XI. for architecture and painting, was incorporated; and for the farther advancement of this institution, the city purchased and gave the palazza Celesti to the academy, that the library, the museum, the observatory, the schools, and the apartments of the professors, might be under the same roof. In ascending the tower you first come to the astronomical school, where is to be seen a model of the Copernican system. Here is also a perpendicular meridian line, cut through a wall a foot thick. On each side hang telescopes, quadrants, &c. so that, as the stars cross the meridian, proper observations may be conveniently made, for which purpose all the shutters in the aperture may be removed at pleasure.

Higher up the tower is the observatory, which on every side has shutters to be opened or shut as required, and a gallery on the outside. This tower is ascended by two hundred and seventy steps, and the top of it also serves for astronomical observations; and through an aperture just over the middle of the spiral stair-case, the stars may be seen in the day-time, from the vault under the tower. The library belonging to the college is in the second story, and chiefly consists of the books of count Marfigli, who founded the academy, and contains several Turkish, Arabic, and other oriental manuscripts. In another apartment is taught experimental philosophy.

The paintings with which this room is decorated represent volcanos, and other mountains of a singular quality; large islands of ice, frequent in the north seas; the cataracts of the Nile, and other great rivers. In a closet adjoining to this apartment are several load-stones, among which is one scarce so large as a man's fist, that weighs only nine ounces without the cap, yet lifts up two hundred and thirty ounces. Another apartment exhibits a variety of shells and other marine productions. Adjoining to this is a closet containing a collection of semi-pellucid stones, as agate, jasper, turquoise, chalcedony, onyx, and lapis-lazuli. The transparent stones are kept in another closet, with the name affixed to each piece. Here are also many hundred species of marble, and other stones, in separate repositories, which being well polished, and all ranged according to their different colours, make a beautiful appearance. In another room are kept several kinds of sea-weeds, corals, sponge, &c. In another, all kinds of exotic fruits, woods, leaves of plants, roots and barks of trees, gums, resins, with the seeds of all kinds of vegetables. One large room contains a variety of all kinds of animals, and another all sorts of warlike instruments.

The painting academy is on the ground-floor, and the ceiling beautifully painted. In winter those who are instructed in painting meet in a particular room, built in the form of an amphitheatre, and well illuminated with lamps, where above a hundred and fifty of them may conveniently sit and draw from the life. In the academy of sculpture are wooden models of the ancient obelisks at Rome, and in a place adjoining to it are statues and copies of the most famous originals in plaster. To this edifice is added a noble printing-house, furnished not only with Latin, Greek, and Hebrew, but also with Arabic and other oriental types.

The Bolognese ladies dress entirely in the French fashion. The women of the middle class generally appear in a black gown, with a black silk veil over their heads; and the female sex in general enjoy a greater freedom here than in most cities of Italy. One meets with many persons walking the streets with spectacles on, who are so far from labouring under any weakness of sight, that they cast their eyes about on all sides without once looking through the glasses. This fashion is of Spanish original, and is supposed to give an air of gravity, which has recommended it to the generality of the monks and clergy.

The Bolognese are famous for their vivacity and wit, and particularly for their satirical jests. However, a stranger no where meets with more civility than at Bologna; but their assiduous application to their several trades and manufactures, is a much more valuable quality.

The little river Reno, a branch of which runs through the city, turns many silk-mills. The Bologna damasks, fattins, taffeties, and velvets, are in great repute. This city also carries on a considerable trade in flax and hemp, and also supplies the neighbouring provinces with oil and wine.

The wine made about Bologna is so strong, that on its first coming from the press it is generally diluted with a fourth part of water; except that appointed for the sacrament, which is without mixture: the neat wine is to be purchased at the convents. Many ingenious works are here made of walnut-tree; for with these trees the country abounds, and the quinces are here large, and of an exquisite flavour. Bologna is likewise celebrated for essences, aqua-vitæ, soap, and snuff; but more particularly for its theriaca, which is prepared in the public elaboratory; and at Bologna rock crystal is wrought into snuff-boxes, lustres, &c.

The nuns of the city are very ingenious in making most beautiful artificial flowers of silver, silk, muslin, enamel, and isinglass. Fruits of all kinds are also imitated in wax, so as scarcely to be distinguished at first sight from the products of nature. This country indeed abounds in honey and wax, great quantities of which are exported. All kinds of provisions are here exceeding good, and in great plenty. Fowls of all kinds are in these parts very large, and of a fine flavour, especially the

the pigeons. The Bologna cervelat, and other sausages, tongues, &c. are famous, not only throughout Europe, but in the East and West Indies.

The other towns in the Bolognese are very small and inconsiderable.

S E C T. VII.

The FERRARESE, or Dutchy of FERRARA.

Its Situation, the Manner in which it became subject to the Pope, its present wretched State, and a particular Description of Ferrara, the Capital of the Country.

THE Ferrarese is bounded on the north by the Polesino di Rovigo, on the west by the dutchy of Mantua, on the south by the Bolognese and Romagna Proper, and on the east by the gulph of Venice. It had formerly its own dukes, who held this country as a fief of the papal see, till 1597, when pope Clement VIII. annexed the country to the Ecclesiastical State; since that time it lies almost uncultivated, though it was one of the finest countries in Italy. The air is unwholesome, on account of the marshes, the inhabitants being too thinly scattered to drain them.

Ferrara is an antient, large, and beautiful city, notwithstanding its being poor and ill peopled. It is seated on the Po, in the forty-fourth degree thirty-six minutes north latitude, and in the twelfth degree fourteen minutes east longitude, thirty miles to the north-east of Bologna. Its fortifications are of little value, except the citadel of five whole, and as many half bastions, built by Clement VIII. Within the city is a large castle, or palace, surrounded with high walls, towers, and moats, at present the residence of the legate a latere over this dutchy. At the entrance are two brass statues of two former dukes, one of whom is on horseback. The streets are long, broad, clean, and regular, with many handsome houses and palaces.

The architecture of the cathedral is in the Gothic taste, and its outside adorned with a multitude of marble pillars and bas-reliefs. Its large square steeple is also entirely of marble. The grand gate is supported with three ranges of pillars, between which are several porticos, one above another, and just above the entrance is a large gilt statue of the Virgin Mary. The chapels of this structure are finely ornamented with sculpture and painting.

Opposite the cathedral are two fine brass statues; the one is equestrian, representing Nicholas d'Este, marquis of Ferrara, with an inscription, intimating, that he thrice restored peace to Italy; the other is sitting between two small figures of brass, upon a pillar about twenty feet high, and represents Borso d'Este, the first duke of Ferrara, one of the most virtuous men in his age. This is said to have been formerly an asylum for criminals, which extended twenty paces round the statue; tho' it has now lost its protecting power. But near it is still a sanctuary; a very handsome pillar adorned with oak branches and leaves, which supports a gilt statue of pope Alexander VII. who is sitting in a chair giving his blessing.

At a small distance is another square in which is the town-house, which is adorned on every side with marble galleries and balustrades, together with several other fine structures. These two squares, with the adjacent streets, are the best peopled parts of the whole city.

The church of the Carmelites is a very spacious structure, filled with fine paintings; the most valuable of which are, a conversion of St. Paul, to whom the church is dedicated; the martyrdom of that apostle; and the adoration of the eastern magi, all in the choir.

The Benedictine convent is very fine; and its cloisters are composed of magnificent porticos. At the foot of the stair-case that leads to the dormitory, is the statue of Otho III. its founder. Its church is large, and the tabernacle of the high altar much admired for the beauty of the workmanship. It is adorned with very fine fluted columns, and the figures of several saints of the Benedictine order. In this church is the tomb of the celebrated Ariosto, the author of Orlando Furioso, and several other pieces highly esteemed. This tomb is of red,

white, and black marble, adorned with columns and statues. His bust is of white marble, and crowned with bays.

The church of the Theatines is large, and their convent very magnificent. Its library is esteemed one of the best in Ferrara, both for printed books and manuscripts.

The Chartreuse is also worthy of notice, and is adorned with very fine porticos. Its church is a large superb building, that contains many magnificent chapels, all adorned with excellent pictures. Those over the high altar, which represent the ascension and the last judgment, are by Bastianino Philippi, a native of Ferrara; but the marriage of Cana in the refectory of the convent, by Bononi, who was born in the same city, is by far the best.

The university of this city is gone to decay, and has only one college, which belongs to the Jesuits.

It must not be omitted, that in 1735 pope Clement III. raised the bishopric of Ferrara to an archbishopric, which at once put an end to the long disputes about jurisdiction between this bishopric and the archbishopric of Ravenna.

Ferrara was very rich, and possessed a great trade, while governed by its own princes, especially its three last dukes, who fortified, embellished, and enlarged it so much, that it contained upwards of a hundred thousand inhabitants; but it is at present very desolate, vast numbers of the houses being uninhabited, and falling to ruin.

In this dutchy are also Comacchio, a bishop's see, but a small place, and two or three market-towns.

S E C T. VIII.

Of ROMAGNA.

Its Situation, Produce, and History; with a Description of Ravenna, Imola, Faenza, Servia, and Rimini.

ROMAGNA, in Latin Romandiola, is bounded on the north by the Ferrarese; on the south by Tuscany and the dutchy of Urbino; on the east by the gulph of Venice; and on the west by the Bolognese and a part of Tuscany. The country produces corn, wine, oil, and fine fruits; and especially salt, from which arises its principal revenue. It has also excellent pastures, with some mines and mineral waters; but the country lies miserably uncultivated, except near the principal towns.

This country was a part of the antient province of Flaminia, which in the fifth century became subject to the Ostrogoths, whose king, named Theodoric, having taken the city of Ravenna in 493, made it his usual place of residence. In the following century the Goths being driven out by Belisarius and Narfes, generals of the emperors of the East, Ravenna became the residence of the emperor's exarch, till the Longobardi made themselves masters of it; but in 755 Pepin, king of the Franks, having compelled Istulphus, king of the Longobardi, to give up the whole exarchate, conferred it on the see of Rome. The most remarkable places in this country are the following:

Ravenna, the capital, was formerly a city of great splendor, but is now mean and inconsiderable. The houses are old and ruinous, the streets filthy, and all parts have a melancholy appearance; for the number of its inhabitants scarce amount to fifteen hundred. In the time of the Romans and Goths it stood on a bay formed by the Adriatic, and had a celebrated harbour; but at present it is three Italian miles from the sea, which is owing to the great quantities of mud thrown up by the tide, and since formed into a tract of land which is cultivated. Without the city is still to be seen a high brick tower, which formerly stood at the harbour, and one mile and a half farther a ruinous old light-house. The air is unwholesome, but has been somewhat improved by conveying along the sides of the city the rivers Montone and Ronco, which carry off the stinking water from the adjoining marshes.

The large market-place of this city is adorned with two lofty pillars of granate, upon which stand at present the statues of St. Victor and St. Apollinaris. In this

area is also erected a brass statue of pope Alexander VII. sitting, which is the usual attitude in public monuments erected to the vicars of Christ. Under an arcade in the market-place are eight small iron gates, which are said to be those taken from the city of Pavia, and set up as trophies of the valour of the inhabitants of Ravenna; but the common people are persuaded that these gates were brought from the Holy Land, and that they were those which Sampson carried away from Gaza.

On the area before the cathedral stands the statue of the Virgin Mary, on the top of a pillar erected to her in 1659, because, according to the inscription, she preserved the city more than once from the plague. The great door of the church is made of rough boards, without any ornament; but what is most remarkable is, that these boards are sawed out of vines, and some of them are twelve feet long and two spans in breadth. In the cathedral are fifty-two large marble pillars in four rows, and in the chapel of the Holy Sacrament is a representation of the children of Israel gathering manna in the Wilderness, with some other paintings by Guido Rheni.

The church of St. Apollinaris is worthy the notice of a traveller. On each side of it are twelve marble pillars, and the ceiling is an old, but beautiful Mosaic work, representing the three Eastern kings worshipping the infant Jesus, and several saints with their names inscribed over them. In the center is the head of the emperor Justinian. The sculpture and marble of the high altar are exceeding beautiful. In St. Anthony's chapel are several fine marble statues: the altar is ornamented with black marble pillars, and near the entrance are two pillars of quince-coloured alabaster. The altar of the chapel della Reliquie is decorated with four beautiful pillars of red porphyry. All the other altars in this church are of marble, adorned with many excellent pieces of painting. Great devotion is paid to the body of St. Apollinaris, and on his coffin are three silver tablets, on which are engraven a long account of his life and martyrdom.

The pavement of St. Vitalis's church is very beautiful, and the Mosaic work in the choir is extremely curious. The ceiling of the church is painted in fresco, and on the walls are painted the martyrdom of St. Vitalis. On the altar della Madonna stand three beautiful white marble statues of the Virgin Mary, and two angels. Over another altar, which is likewise of white marble, is an excellent Pieta, between two angels.

The church called the Rotonda lies without the city, and at present resembles a ruined cupola. Its diameter is about sixteen common paces, and its pavement, except in the dry summer months, is always under water. It is supposed to have been built in the year 526 by Amalasunta, daughter to Theodoric, king of the Ostrogoths. The most remarkable part of it is the roof, which is in the form of an inverted dish, and consists of one single stone, which many years after this church was built was split by lightning: it is as hard as a flint, and, according to an account written on vellum, and kept on the altar of the chapel, was brought out of Egypt. The thickness of this stone is four geometrical feet, the circumference a hundred and fourteen, and the diameter thirty-one feet two inches. It is difficult to conceive, says Mr. Keyser, in what manner, at a time when the modern machines were in a great measure unknown, this huge mass, the weight of which cannot be less than a hundred tons, was raised to the top of this edifice. Round this stone formerly stood the statues of the twelve apostles, as appears from their names still to be seen on the pedestals, which project a little way from this stone roof, and in the center stood a coffin of porphyry, in which was the body of Theodoric, king of the Ostrogoths.

On a fountain in the area before the pope's palace is an antient statue of Hercules, bearing on his shoulder an hemisphere that serves for a sun-dial. The club on which he leans distinguishes him from Atlas, for whom he might otherwise easily be taken.

Good spring water is extremely scarce at Ravenna; and seems to have been more so in the time of the Romans; for Juvenal thus complains:

"By a Ravenna vintner once betray'd,
"So much for wine and water mix'd I pay'd;
"But when I thought the purchas'd liquor mine,
"The rascal fobb'd me off with only wine."

After thus describing the capital, we shall mention some other places worthy of notice.

Imola, the antient Forum Corneli, is a pretty town on an island formed by the river Santerno, nine miles to the north-west of Faenza. It has a wall, moats, and towers, with a strong old castle; it is the residence of a bishop, suffragan to the archbishop of Ravenna, and contains fifty churches, convents, and hospitals.

Faenza, in Latin Faventia, a town thirty-four miles to the east of Bologna, is seated on the river Amone, from which a canal runs through the city, and afterwards falls into the river below it. Over the Amone is a stone bridge, with towers leading to a suburb that has some fortifications, though, like those of the city, they are of no consequence. It is a bishop's see under the archbishop of Ravenna, has a fine market-place, and is famous all over Italy for the goodness of its earthenware.

Servia, a small new-built town near the sea, with handsome broad streets. It formerly stood about half an Italian mile farther from the shore; but was removed hither in the year 1703, on account of the unwholesomeness of the air. Its bishop is suffragan to the archbishop of Ravenna. Up the country is a low tract of ground about two Italian miles and an half in length, and in some parts nearly as broad, into which, during the summer, the sea-water is conveyed through a large handsome canal. The heat of the sun prepares the water in this spacious reservoir for making salt, of which the apostolic chamber have the superintendency, and supply the provinces of Urbino, Ferrara, Cona, Bologna, and Romagna.

Rimini, a city on the river Marecchia, which was formerly called Ariminum, twenty miles to the south-east of Ravenna. It was once situated by the sea, as appears from the remaining mole of the old harbour near the city walls; but now it is thirteen hundred paces distant, the sea having thrown up a large tract of land that has been improved for tillage and gardening, and the harbour is so choaked up with sand, as scarce to admit of small barks. Ravenna was antiently in a very flourishing condition; but, among other calamities, suffered extremely by an earthquake in the year 1671; but it is still a bishopric suffragan to Ravenna, and is venerable for many monuments of its antient splendor. A little without the town towards Pesaro is a triumphal arch, on each front of which are two beautiful columns, and two bustos. This was erected to the emperor Augustus. Here are also the remains of an amphitheatre, and several antient inscriptions. Among its churches, that of the Franciscans is the finest. In the square before the council-house is a beautiful fountain, on which stands a small bronze statue of St. Paul. In this city is also a large library, in a very elegant structure, for the use of the public.

SECT. IX.

The Dutchy of URBINO.

Its Situation, Extent, Produce, and History; with a Description of the Cities of Urbino, Pesaro, and Fano.

THE dutchy of Urbino is bounded on the north by the gulph of Venice; on the south by Perugino and Umbria; on the east by the marquisate of Ancona; and on the west by Tuscany and Romagna; extending about fifty-five miles in length and forty-five in breadth. It contains fruit, great plenty of game, as well as fish; but the air is not very wholesome, nor is the soil remarkable for its fertility.

This dutchy had formerly its own dukes, of whom the last, Francis Maria, of Rovere, dying in 1631, the papal treasury took possession of his territory, the same duke having before, by will, confirmed the pope's claims, and

and in effect made over the country to him. The principal places in this duchy are the following :

Urbino, the capital of the country, is seated on a mountain between the rivers Metro and Foglia, twenty miles to the south of Rimini, and is a handsome place, where the dukes formerly resided ; and, though not large, is the residence of a legate and archbishop. The houses are very well built, and great quantities of fine earthenware are made here. The palace of its former dukes is a fine building.

Pesaro, a sea-port at the mouth of the Foglia, in a pleasant country, is a handsome clean city, which has some fortifications, and is the see of a bishop suffragan to Urbino. There is here a fountain of mineral water, which, though its jet d'eau is not extraordinary, is very convenient for the inhabitants, and is ornamented in a good taste. In its upper basin, which is in the form of a drinking-glass, are several sea-goddesses and sea-horses, which spout water from about thirty different apertures. In the great market-place is a highly finished marble statue of pope Urban VIII. in a sitting attitude. The city contains many fine churches, convents, and palaces ; and the figs of this country are reckoned the best in Italy. Round Pesaro is a fine country, divided into square inclosures by rows of trees, interwoven with vines.

Poggio Imperiale is an antient pleasure-house of the dukes of Urbino, seated on a hill about a mile from Pesaro, and is adorned with some good paintings by Genga, and a fine orangery.

Fano, a sea-port, pretty well fortified, with a harbour for small vessels, is seated about twenty miles to the east of Urbino, and derives its name from a *fanum*, or temple of Fortune, which antiently stood here. In commemoration of this, the image of Fortune is not only erected on the fountain in the market-place, but has also a place in the arms of the city. This is a bishop's see, which depends immediately on the pope, and has forty-four churches and convents. The greatest curiosity here is a marble triumphal arch in honour of the emperor Augustus, which after having withstood the injuries of time till the year 1458, was then much damaged by the cannon, during the siege of Fano. This arch had formerly three gates ; but the smallest on the left hand, in coming from the town, has been pulled down to make room for St. Michael's church, and the other is stopped by a mean house ; so that the middle gate is now the only one open. In the cathedral of Fano are some admirable paintings, representing the annunciation, the Lord's supper, and the gathering of manna, by Quercini ; and the assumption of the Virgin Mary, by Caraccioli. In the chapel of the Virgin Mary are the fifteen mysteries of the rosary, painted by Domenichino. St. Peter's church also deserves notice for its cupola, sculpture, and paintings. On the high altar are two angels of white Carrara marble, by an eminent hand ; the picture of Christ delivering the keys to Peter, by Guido Rheni ; with several other pieces. A nobleman, by the name of Torelli, has erected in the market-place at Fano a very elegant theatre for exhibiting comedies and operas, which is made use of in carnival time.

Here are also Sinigaglia, Possombrone, Borgo St. Sepulchro, St. Leo, Cagli, and Gubio, each of which is the see of a bishop, with some other small places.

S E C T. X.

The Marquisate of ANCONA.

Its Situation, Produce, and Rivers ; with a remarkable Account of the Ballani, a Shell-fish inclosed in Stones, with other Kinds of Sea-fish in the Adriatic : a concise History of the Country, with a particular Description of the Cities of Ancona and Loretto, including an accurate Account of the Casa Santa.

THE marquisate of Ancona is bounded on the north and east by the Adriatic sea ; on the west by the duchy of Urbino ; on the south by Umbria, or the duchy of Spoleto ; and on the east by the Farther Abruzzo, from which it is separated by the river Tronto ;

extending from east to west about eighty miles, and sixty from north to south.

The air is extremely temperate, and the soil so fruitful, that it has been formerly called the garden of Italy. It produces a great variety of excellent fruit, with flax and bees-wax.

This country is watered by no less than twelve rivers ; these are the Fiumefino, the Aspidio, Masone, Potentia, Lasino, Chiento, Tingo, or Tenna, Leta-Vino, Asone, Tosino, Ragnola, and Tronto.

This would be still an excellent spot, and its inhabitants very rich, had they not the misfortune to groan under the tyranny of priests. On this account it is a desert, if compared to what it was formerly ; for Pliny assures us, that after a long bloody war it submitted at last to the Romans, with upwards of four hundred thousand inhabitants.

The eastern part of Italy is much more pleasant and fertile than most parts on the west side.

All along the coast of Ancona, on the Adriatic sea, stands a range of towers, at the distance of half a mile from each other, defended by one or two pieces of cannon, in order to hinder the landing of pirates, or the corsairs of Barbary.

In the loamy shallows along this shore, and especially near Monte Comero, or Conaro, ten miles from the city of Ancona, are found the ballani, a sort of shell-fish, which, when alive, harbour in a kind of large spongy stone, and, being not unlike a date kernel, are called sea-dates. Frequently twenty or thirty of these are found in one stone. Many of these stones have little orifices on their surface ; but others have none at all, notwithstanding which the fish live and grow up in them. At Ancona they are larger than at Conaro ; but the largest do not much exceed a finger in length. When they fish for ballani, they pick up such stones as have their surface full of little holes, these being a certain sign that the fish have insinuated themselves into them : but sometimes the aperture through which the spawn, or small fry of the fish, have penetrated into the stone, happens to be afterwards stopped up so as not to be discernible, and yet they thrive very well. They have no more room than is just necessary to open their shell a little way, this having been gradually abraded by their motion, in order to make room for their growth. The only way of getting them out, is by breaking the stone ; for the passage through which they entered is much too small even for the young fry to come out at. If two or more of these shell-fish happen by their growth to come into contact with each other in the same stone, only one fish is found to be alive. The inside of the shell is white, but the outside of an ash-colour. When taken out of the stone a gut resembling a worm about the length of a man's finger, hangs to them. This is entirely white, and full of clear water, which it squirts out when pleased. Such as find a particular delicacy in the taste of these fish, say, that they do not feed on the grosser parts of the sea-water, but as it were on the subtle dew which penetrates through the stone, and thus undergoes a kind of filtration. It is very remarkable, that both the fish and the juices got from them are so luminous in the dark, that one might read by them ; and even the water into which this fish has been squeezed, when put in a glass, emits an effulgence that lasts between ten and twelve hours. Great quantities of these fish are sent to Rome, where they are reckoned dainties.

At Ancona is also a kind of sea craw-fish, called nocchia, that have some resemblance to our lobsters, but have a more delicate flavour. Their claws are less than those of a craw-fish, and the head and tail are of a very uncommon shape. The largest of these species is about four inches in length.

Among other remarkable sea animals in the harbour of Ancona is a fish called the sepi, which is probably a species of the cuttle-fish, and has a long whitish shell on its head.

In the neighbourhood of Ancona are dug out of the ground amber, sulphur, and several mineral refins. The sea near Ancona is observed to ebb and flow about a foot, or a foot and a half ; but this tide gradually abates as the Adriatic sea approaches to its junction with the Mediterranean,

anean, and increases in its northern part towards the city of Venice.

The inhabitants of Ancona, especially the female sex, so far excel those of the other parts of Italy in shape and complexion, that they seem to be a different race of people. The same may be observed of the inhabitants as far as Rimini.

With respect to the history of this country, it will be sufficient to observe, that over the city of Ancona and its district, antiently called Picenum, was formerly placed a governor, who had the title of margrave, whence is derived the appellation of the marche or marquisate of Ancona; but afterwards recovering its freedom, it continued independent till the year 1532, at which time Lewis Gonzaga, general of pope Clement VII. rendered it subject to the pope. Under the plausible pretence of defending it against the incursions of the Turks and banditti, the bishop of Carla and the above Lewis de Gonzaga prevailed on the inhabitants to permit them to build a citadel. As soon as this was done, Gonzaga having drawn out all the young men of the city, under the pretence of exercising them in arms, the perfidious bishop sallied out of the citadel with his garrison, caused the gates to be shut, seized the magistrates, and obliged them, with the rest of the inhabitants, to take an oath of obedience and subjection to the pope.

Ancona, the capital of the country, is situated in the forty-third degree twenty minutes north latitude, and in the fifteenth degree east longitude; and stands on the sea between two hills, on one of which is the citadel, and on the other the cathedral. It cannot be termed small, and some parts are not unhandsome; but it is far from being so populous and wealthy as it might be, from the conveniency of its situation and the goodness of its harbour. This harbour was considerably improved by the emperor Trajan, and in commemoration thereof a triumphal arch of fine veined marble was erected to him on the mole, which still makes a beautiful appearance, it having eight fluted columns, which are still entire and very elegant. The extremity of this mole is fortified and planted with ten or twelve pieces of cannon, which contribute to secure the harbour. Over one of the gates of the city is a Latin inscription to this purpose: "Fair Probity, which built this city, delights to associate with Peace on this happy spot."

The cathedral is incrustured with marble, and from its situation affords a delightful prospect of the town and along the sea-coast. In the portico before it are two remarkable pillars resting on two marble lions. The churches, convents, and hospitals, are forty-five in number, and the bishop depends immediately on the pope. The exchange within the city is a large elegant building, and persons of all religions enjoy liberty of conscience, though the Protestants are not allowed any place of public worship: the trade, however, is but inconsiderable, and for the greater part kept up by the Jews, who amount to about five thousand, and live together in a particular quarter, where they have a synagogue, but are distinguished from the Christians by a bit of red cloth in their hats. The large lazaretto for performing quarantine stands partly on the shore and partly on the sea.

Loretto is a small town very pleasantly situated on a hill, about fifteen miles to the south of Ancona. It is two thousand paces from the sea, and with the most delightful prospect on all sides; is surrounded with deep moats and small towers, which, however, would prove but a slender defence in case of an attack. The Santa Casa, or Holy-house, which has rendered this place so famous throughout all the catholic part of Christendom, is said to be the very same in which the Virgin Mary lived with Joseph at Nazareth. According to the history of the adventures of this building, it is pretended that in May 1291 it was transported by angels through the air from Galilee to Tersato, in Dalmatia, and three years and an half after into Italy; where, on the tenth of December, 1294, about midnight, it was first placed in a wood belonging to Recanati, a thousand paces distant from the sea. Eight months after it was again removed a thousand paces nearer to Recanati; and at last, as it

were with more mature deliberation, deposited in its present place. Nothing can be more amazing than the credit given to such an absurd and ridiculous fable, by which all popish countries have been voluntarily drawn to make burthensome contributions, it being notorious, that with respect to the received chronology of this miraculous transmigration, the sacred house had been placed in Italy, and its fame much celebrated, even long before some popish writers, as St. Vincent and others, sought for it in Nazareth, and maintained that they saw it there.

The sacred house itself is built of bricks of unequal size. The length within is thirty-one feet nine inches, the breadth thirteen feet and near three inches, and the height eighteen feet nine inches at the sides; but the center of the roof is five palms higher than the sides.

On the top of the Casa Santa is a little tower, which the Roman Catholics cannot deny to have been the work of Christians; since it is contrary to all probability to imagine, that the Virgin Mary had such a tower erected upon her mean habitation. In violent tempests of thunder and lightning they ring two little bells which are hung in this tower, not doubting but that their sound will disperse any tempest, and prevent any ill effects from it.

One part of the Casa Santa may be considered as the Holy of Holies, it being separated from the other part by a silver balustrade, and a gate of the same metal. In the larger part are thirty-seven silver lamps, some weighing fifty, others eighty, others a hundred and four, and four of them weigh a hundred and twenty-eight pounds each. This part is also separated from the other by an altar, which being without a back, affords a view of the celebrated image. In this larger part is the greatest curiosity, that is, the window by which the angel Gabriel entered at the Annunciation; over which is a picture of the Crucifixion, pretended to be brought by the apostles into this house, and to have been done by St. Luke. The smaller part has the wall plated over with silver, and contains the hearth where the blessed Virgin used to dress her victuals, and over it stands her image, which is five feet high, and is said to be made of cedar by the hand of St. Luke; the infant on her right arm is also of cedar; it is not quite two palms in height; and in her left hand she has a globe. The faces of both images have been over-laid with a kind of silver lacker, which is now become quite black with the continual smoke of the lamps; so that the Virgin Mary wants only thick lips to make her a perfect Negro. The infant Jesus is dressed in a flame-coloured habit, and the Virgin Mary in an azure robe; with which she is so modestly covered, that no part of the statue is to be seen, but its face and toes. The mantle hanging down her shoulders is of the same colour, powdered with golden stars: her hair hangs on her shoulders and part of her back. On her head is a triple crown of gold, enriched with pearls and diamonds, and another is on that of the child Jesus; both the gift of Lewis XIII. king of France, and valued at seventy-five thousand crowns. The gold chains, rings, and jewels, with which the image of the Virgin is loaded, are frequently changed, and her apparel is not always the same; for on the seven days of Passion-week she is dressed in deep mourning, and has daily a fresh suit. The niche in which the image stands, is adorned with seventy-one large Bohemian topazes. On the right side of the image is an angel of cast gold, profusely enriched with diamonds and other gems, with one knee inclined, offering a golden heart embellished with large diamonds, and terminating in a flame of rubies and pearls. This piece is said to have cost fifty thousand ducats, and was offered by Maria Beatrix Eleanora, queen to James II. of England, that by the intercession of the Virgin, she might conceive a son; and it is said, that soon after she had the son who has made such noise under the name of the Pretender to the British crown. On the left side of the Virgin is a silver angel, in the same posture of reverence, offering her a golden heart crowned, and glittering with pearls, emeralds, and diamonds, likewise terminating in a flame: this was presented by the mother of the same prince. On the right hand of the Virgin

is

is a silver angel, weighing three hundred and fifty-one pounds, offering on a cushion of the same metal an infant of massy gold, weighing twenty-four pounds. This was presented by Lewis XIII. king of France, for the birth of the dauphin, afterwards Lewis XIV. Seven golden lamps are continually burning before the image; one of which, presented by the republic of Venice, weighs thirty-seven pounds and a half. Under this hangs another richly set with jewels. The lamp that stands next the Virgin's face, which is held by three angels, weighs nine pounds; and another, which Francis II. duke of Modena, offered to the Virgin, weighs eighteen pounds and a half. On both sides of the niche are cupboards filled with the antient ornaments of this statue; and in a little window in the wall are some earthen-dishes said to be used by the Holy Family. Some of these vessels have since been edged with gold.

The robe which this famous image had on when it was brought from Dalmatia into Italy, is of red camblet, and kept in a glass shrine. The dish out of which it is pretended the Virgin and her divine Infant used to eat, is shaped like a shallow bowl, and of earthen-ware; but its outside is now plated over with silver. This utensil is not only kissed, but rosaries, medals, *Agnus Dei's*, crucifixes, and paper caps painted with the image of the Madonna of Loretto are rubbed against it, from a firm persuasion that they thus become an infallible remedy against the head-ach, and other disorders. An ague is said to have been perfectly cured only by drinking a little cold water out of this dish: even the oil and wax of the lamps and candles burning before the image are not without their medicinal virtues.

Notwithstanding the mean appearance of the walls within, the outside of the Casa Santa is most elegantly adorned with the finest marble; but is so contrived, that the marble structure serves only as a case for it, leaving a small interval between it and the brick walls of the Casa Santa. This is partly to be attributed to the veneration entertained for those sacred materials, and partly from an apprehension that they would not have suffered the new and unhallowed marble to be in contact with them; but would have repelled it with such violence as to endanger the lives of the workmen. This, it is pretended, formerly happened to some builders, who, from an indiscreet zeal, were going to strengthen these sacred walls by some new additions.

The marble case was begun in the year 1514, and consecrated in 1538 by Paul III. The expence of it at that time, when labour was cheap, amounted to twenty-two thousand ducats, exclusive of twenty marble statues, and four brass doors of curious workmanship, that must have cost an immense sum. One of these is, however, a false door, there being but three entrances cut through the wall. The most celebrated sculptors of that age seemed to have emulated each other in this noble structure. It is about fifty feet in length, thirty broad, and about the same height; and the two longer sides are adorned with twelve Corinthian columns, while the two other sides have eight. The intervals between the columns are filled with basso relievos finely executed, representing the most remarkable incidents in the life of the blessed Virgin. There are also ten statues of the Prophets, and above them the ten Sibyls. Among the Prophets on the south side, David, with the head of Goliath at his feet, is greatly admired by all connoisseurs: and on the north-side, in a groupe representing the espousals of the Virgin Mary, a boy playing with a dog, whilst his mother, with a child in her arms, looks at him with a countenance full of maternal tenderness and complacency, cannot be viewed without pleasure.

The treasury infinitely surpasses the Holy-house in riches. It is a spacious hall wainscotted, and the arched roof is divided by gilt compartments, beautified with excellent pictures. They were formerly glad to keep a number of works in silver in large presses of folding doors, but that metal is now laid up in heaps in private places, and perhaps for private uses; and they are now filled with nothing but pure gold, an amazing quantity of the largest and richest jewels, and such vessels and ornaments as are supposed to exceed the value of gold and gems.

The large church in which the case of the Holy house stands, as it were under a tent, is built of Istrian stone; but the front is entirely of marble finely embellished with sculpture, and over the portal is a statue of the Holy Virgin by Lombardi. The three gates on this side of the church are of brass, with beautiful basso relievos representing different histories of the Old Testament by Lombardi. Here are about twenty altars and chapels, in which all the celebrated artists gave specimens of their skill. The great cupola is supported by eight large pilasters, and on the inside is the assumption and glorification of the Virgin Mary, by Christopher Roncalli.

The font, which stands in a separate chapel, is of bronze, embellished with beautiful basso relievos, and the basin is supported by four angels, over which is painted our Saviour's baptism.

Formerly the walls of the church of Loretto were covered with multitudes of pictures and votive pieces, some of wood, others of wax or brass: but besides the coarseness of the performance and meanness of many of them, they very much darkened the church, and therefore, in 1673, the greatest part of them were removed and the silver and gold tablets employed to better uses.

Near the Casa Santa in this church is the picture of a priest offering his entrails to the Virgin Mary, and under it is a most ridiculous inscription to the following purpose: that this priest, who was a Dalmatian, and lived in the beginning of the sixteenth century, being taken prisoner by the Turks, and strongly solicited to abjure the Christian religion, so incensed them by his continually calling upon Christ and the Virgin, and promising a pilgrimage to Loretto, that they at last ripped open his breast, and putting his heart and entrails into his hands, sarcastically bid him go and perform his promise; on which he set out for Loretto, where having shewed his empty breast, and offered his heart and entrails to the image of the Virgin, he related the whole affair, and having received the sacrament died in an extacy of joy.

The number of pilgrims who annually visited this place formerly, amounted to two hundred thousand, but the Reformation has given a severe blow to indulgences, and the zeal for tire some pilgrimages is greatly cooled; so that at present the number of pilgrims who annually repair thither, seldom exceeds forty or fifty thousand. Some come on foot, and others ride on horses or asses. The female pilgrims, who can afford the expence, generally travel to Loretto in a carriage; and as large companies often travel together, many droll incidents happen on the road. As soon as they enter the suburbs they set up a singing, which continues till they reach the church. If the company be too large, the ceremony of going round the Casa Santa on their knees is omitted, and they are obliged to express their devotion in some other manner. The poorer sort of pilgrims are received into an hospital, where they are provided with beds, and have bread and wine every morning and evening for three days.

Loretto is generally without a garrison, so that it seems somewhat strange the Turks have not made greater efforts for getting into their hands the precious booty kept there, than they have hitherto done. The Roman catholics indeed affirm, that in all the attempts which the Turks have hitherto made against Loretto, they have either been repelled by some extraordinary miracle, or miscarried by a supernatural panic. But all these pretended miracles have not produced such confidence in the inhabitants as to put the affair upon such an issue; the treasure being upon the least appearance of danger sent away to Ancona, or some other place of security. But the reason why the Turks make no formal attempt upon this place may probably be owing to the shallowness of the Adriatic, which in these parts has not a sufficient depth of water for large ships to approach the shore; besides, a Turkish garrison is no sooner known to be at sea, than a strong garrison is immediately sent thither.

In going out of the church on the right hand, is a statue of Sixtus V. seated on a pedestal decorated on every side with basso relievos all of bronze. In the great

area before the church is a beautiful marble fountain, made at the expence of Paul V. to whom the city owes the fine water it receives by means of an aqueduct from a neighbouring hill. In the palace which stands in this area, the clergy, the officers of the Holy-house, and the governor of the town, have apartments, besides those appointed for persons of distinction who come hither upon pilgrimages. Here are also the wine vaults belonging to the Holy-house, which are one hundred and fifty-eight common paces in length; and in these vaults are generally kept one hundred and forty large casks of wine. Over the wine cellar are the kitchen, offices, and dispensary. In the latter are three hundred and sixty-eight gallipots, most of them very large and with covers, which are extremely valued on account of the paintings on them, said to be the work of the great Raphael. The subject of these paintings is a medley of stories taken from the Scriptures, the Roman history, and Ovid's Metamorphoses.

The arsenal is in one of the upper stories; it is pretty well furnished, and one closet is full of prohibited weapons which have been offered to the Virgin.

The trade carried on by the inhabitants of Loretto, besides what they get by entertaining strangers, consists in making and selling medals, crucifixes, images of the Virgin Mary, rosaries, painted paper caps, ribbons, &c. which are bought by the credulous Papists as amulets.

The vast concourse of foreigners occasions a great consumption of provisions in this city, and the inn-keepers are for imposing as much as they can upon strangers; but the entertainment is generally very good, and the inhabitants behave with great civility. It is observed, that the lower class of people are much more reasonable in their demands from those travellers who return from Rome, than from such as travel to that city; for they conclude that the latter are strangers to the customs of the road, and think it allowable to take all advantages of the unexperienced.

The country about Loretto, as well as the town itself, swarms with beggars; with whom it is customary in spring to strew flowers in the road, when strangers approach, who cannot see such an honour paid them, without giving a small gratuity in return for it.

There are several other towns in the marquisate of Ancona; but as they contain nothing very extraordinary, we shall omit giving an account of them.

S E C T. XI.

Of the PERUGINO, ORVIETANO, and SPOLETTO.

Their Situation, Extent, and principal Cities.

THE Perugino, or territory of Perugia, is bounded on the west by Tuscany; on the north by the duchy of Urbino; on the east by Spoleto; and on the south by Orvietano; extending about twenty-eight miles from north to south, and about thirty from east to west.

The Tiber, which runs across the country from the north-west towards the south, is the principal river; besides which there are several smaller. This territory contains a pretty large lake, anciently called Thrasimene, but at present the lake of Perugia, in which are three islands. Between this lake and a high mountain near Cortona, in the dominions of Florence, is a long valley with only one narrow entrance, where Hannibal defeated Flaminius the Roman general.

The air of this territory is very pure, and the soil fertile in corn and wine; besides, the lake supplies the country with plenty of fish.

The principal city in this province is Perugia, which is very ancient; and like its citadel is going to decay. It is advantageously seated upon a hill seventy-five miles to the north of Rome. It is the see of a bishop, and has an university that has three considerable colleges; besides which it has two academies, one of which was founded so lately as the year 1752. This city is famous for the residence of several persons of quality, and for a very

agreeable sort of white wine, as clear as rock water, with somewhat of the flavour of muscadine.

There are three or four small towns in this territory, with some villages.

The territory of Orvieto is bounded on the north and east by Spoleto, on the west by the Siennese, and on the south by the remaining part of St. Peter's patrimony and Castro. In this canton is the lake Boffena, formerly Volcini.

Orvieto, the capital of this territory, is built on a high and craggy rock near the confluence of the rivers Paglia and Chiuna, which fall into the river Tyber a little below it, twenty-six miles to the south-east of Perugia. It is an episcopal see, and has six churches and convents. Its walls are strong, though ancient, and both the cathedral and the other churches, as well as the vice-legat's palace, are very noble edifices, enriched with great quantities of marble, porphyry, stately towers and steeples, and especially paintings. The palace was built by pope Urban VIII. who also adorned several of the churches and public structures. But what is most singular in this city, is a well cut into the rock by order of pope Clement VII. to supply it with fresh water. This well is two hundred and fifty cubits deep: one descends into it by a double stair-case of five hundred and fifty steps, enlightened by seventy windows cut through the rock. The mules which bring up the water upon their backs, go down one stair-case and up the other. The town neither has nor needs any other fortifications than those solid rocks and precipices with which it is surrounded, and from which one can hardly look down without dread. The height of the city renders the air very serene and healthy, except in autumn, when they steep their hemp in the river Paglia, which causes a very offensive stench.

Aqua Pendente, a pretty large city, but indifferently peopled, stands on an eminence about twelve miles between Orvieto on the east, and Savona on the west, near the river Paglia, and was erected into a bishopric by pope Innocent X. in the year 1650, or rather the see was removed thither from Castro, which city he caused to be razed for having murdered the bishop.

There are no other places in this territory worthy of notice.

Spoleto is bounded on the north by the marquisate of Ancona and the duchy of Urbino; on the east by the Farther Abruzzo; on the south by Sabina and the patrimony of St. Peter; and on the west by Orvietano and Perugino; extending about forty-five miles in length, and forty in breadth, and abounding in corn, wine, oil, almonds, and other fruit.

This duchy, which is part of the ancient Umbria, on the extinction of the Longobardian monarchy, became subject to the Franks, and was afterwards annexed to the papal territories.

The principal places in this duchy are the following:

Fuligno, or Foligno, a small city surrounded by an old wall with port-holes, and almost of a circular form. It is situated fifteen miles to the north of Spoleto, in a pleasant plain, encompassed at a distance with a chain of beautiful hills that extend farther than the eye can reach, and that form a vast amphitheatre, interspersed with towns, villages, and country seats, that may be discerned through the trees, which are chiefly planted in straight lines, and cover part of the plain, while the spaces between them are laid out in corn-fields and vineyards. It is the see of a bishop appointed by the pope. The cathedral is dedicated to St. Felician, formerly bishop of Fuligno, but has scarce any thing remarkable, except some good paintings in fresco, and some magnificent tombs.

In the church of the nuns of St. Francis is an altar-piece by Raphael Urbino, in which the Virgin Mary is represented in all her glory, and below St. John the Baptist, St. Francis, and Cardinal Conti, first secretary to pope Julius II. who ordered it to be painted. In the Franciscan church are four bodies of saints in shrines of silver gilt, placed upon four different altars; but the most honoured of them is that of St. Angela, a lady of quality in the city of Fuligno, who made a vow of chastity,

chastity, after burying three husbands and fifteen children.

Fuligno has some fine streets, but neither the square, the town-house, the governor's palace, nor that of the bishop are worth notice. The most remarkable building in the whole town is the house of the marquis Justi, which has a grand and regular front; the inside is spacious, and the apartments well furnished.

Affisa, or Anisio, is seated on a hill about twelve miles to the east of Perugia, and though it is but small, is a bishopric in the pope's nomination. Here St. Francis was born, and his remains are deposited in a small vault under the high altar of the Franciscan church. The situation of this convent is very fine: it is said to be built on the ruins of a temple dedicated to Jupiter Paganicus; and the popes have granted such indulgences to this church, that those who enter it on the feast of St. Francis are absolved from all their sins. A great number of silver lamps are continually burning round the place where his body is deposited. The monks, among their other relics, pretend to have a piece of our Saviour's tomb, and of the pillar at which he was scourged, a thorn out of his crown, the point of one of the nails that fastened him to the cross; together with some hair, with a girdle and robe, of the Holy Virgin. The church of St. Clara is seated at the extremity of the city; but contains nothing remarkable, except an ancient picture of the cross, which it is pretended spoke three times to St. Francis.

The city of Spoleto or Spoletto, the capital of the duchy of the same name, is situated in the forty-second degree forty-one minutes north latitude, and in the fifteenth degree forty-seven minutes east longitude. It appears at a distance like an amphitheatre that terminates the beautiful plain of Fuligno, and is seated on the declivity of a hill that renders the streets very uneven. It is surrounded only by a single wall, with port-holes; and its castle is a Gothic structure, that entirely commands the place. This city contains twenty-one parish churches and a like number of convents, seventeen hermitages, and thirteen religious fraternities. The square of Spoleto is very small, and the cathedral but a mean structure, though the pavement, which is composed of small pieces of marble, curiously arranged, is very beautiful. The bishop's palace is also a mean building, and though the city is a bishopric suffragan to the pope, and is the capital of a duchy, it makes but an indifferent appearance, and is very poorly peopled.

Among the remaining antiquities of this city the most considerable are, a triumphal arch very much decayed, an aqueduct, the ruins of a palace built by Theodoric, king of the Ostrogoths, and those of an amphitheatre. With respect to the aqueduct, it is still entire, and conveys water into the city. It is said indeed to be of Gothic work, but it is so magnificent that it would be no discredit to the ancient Romans, and has not perhaps its equal in Europe. It joins Monte Lugo to the hill on which Spoleto is seated, and consists of ten free-stone arches between four and five hundred feet in height, from the bottom of the valley, and three hundred and fifty feet in length. What appears very singular, is their having cut a path beneath the water course on the crown of the arches, by which means they can walk from one mountain to another. At the extremity of the aqueduct is an antique head of a lion, of an extraordinary magnitude, which discharges through its mouth, with great violence, a prodigious quantity of water into a basin, from whence it runs into two others much larger, and is thence conveyed to different parts of the city.

Monte Lugo is remarkably pleasant, for it enjoys a perpetual verdure, and is plentifully stocked with fruit-trees, and springs of clear water, on which account there are said to be here above fifty hermitages.

Narni, the ancient Narnia, is a poor town delightfully situated on a high rocky mountain, forty-six miles to the north of Rome. This was the native place of the emperor Nerva, and is at present the see of a bishop, immediately subordinate to the pope. Here are some good springs, and a noble aqueduct, by which the water is conveyed to this place from the distance of fifteen Italian miles. Below the city is a valley, through which

the river Nera passes, where are the remains of a grand stone bridge over the river, built by Augustus, and contrived in such a manner as to join two opposite mountains on each side of the river.

The road from Narni to the city of Terni, extends through a delightful valley planted with rows of trees, round the trunks of which twine very thick and large vines. This country also abounds with fig-trees and olive yards. The turnips it produces, which thrive best in a gravelly soil, are so large as sometimes to weigh between thirty and forty pounds. Melons, peaches, figs, and other fruit, are also larger here than in other parts.

The famous cataract, commonly called *Cascata del Marmore*, from the mountain down which the Velino falls, being almost wholly of marble, lies about three miles from Terni, and the road to it, part of which is cut in the rock in the side of the mountain, is without rails, very slippery, and consequently very dangerous to men and horses. The spectator is struck with terror on viewing the precipices, which are of a frightful height; but the traveller is sufficiently rewarded when, on reaching the top of the mountain, he views the stupendous cataract formed by the river Velino, rushing from the mountain.

The river, after running some miles with a gentle course, reaches the declivity of its channel, which is shaded with many thick trees, covered with perpetual verdure, as are the mountains by which this is surrounded. The water no sooner reaches this declivity than it proceeds with so rapid a course, that every wave seems to press forward to overtake the former, till they rush at once with a furious noise down a steep rock, at least three hundred feet high, falling on other rocks, against which they dash and break, rising in mists, which, after hovering some time in the air, far above the level of the cataract, and the neighbouring fields, fall in a kind of perpetual rain into the adjacent valley. After this fall the waters rush into the cavities of the rocks, and then foaming, burst thro' several openings; and after rolling for some time down other precipices, at last reach the bed of the river at the bottom.

Terni, an ancient city, has several remains of structures built by the Romans, but they are chiefly in ruins. In the square is a very fine fountain cut out of the rock, on which stands a pyramid; on the sides are two statues, representing two Naiades, or river nymphs, with a large lion, which appears as if desirous of coming out of the hollow of a rock. Terni is encompassed only with a single wall, and is at present smaller than Spoleto, though better peopled. Most of the streets are badly paved, and those which run across the town are not paved at all, which occasions their being very dirty. It is the see of a bishop suffragan to the pope. The cathedral is a modern structure, and there are some convents, but they contain nothing remarkable.

The inhabitants carry on a pretty good trade in black taffeties and olive oil. Their wine is very good, and their pigeons excellent. Terni boasts of having given birth to Cornelius Tacitus, the celebrated historian, and to the two emperors Tacitus and Florianus.

Between six and seven Italian miles to the north-west of Terni, is mount Eolo, remarkable for its cool breezes, which, especially in summer, issue from the chasms in the rocks of this mountain.

S E C T. XII.

SABINA, CASTRO, and St. PETER'S PATRIMONY.

Their Situation, Extent, Produce, and principal Places.

THE province of Sabina derives its name from the Sabines, whose country also included a part of the present duchy of Spoleto. It is bounded on the north by Umbria; on the east by the Farther Abruzzo; on the south by the Campania of Rome; and on the west by St. Peter's Patrimony. It is twenty-two miles in length, and almost as much in breadth. It abounds in oil and wine, and is watered by several small rivers, which render it fertile.

In this province are no walled towns; its principal place is Magliano, which is seated on a mountain near the river Tiber, thirty miles to the south-west of Spolitto. It is a small place, but is pretty populous considering its extent.

The duchy of Castro is bounded on the north by Orvietano; on the east by the river Marta; on the south by the Mediterranean; and on the west by Tuscany; and produces corn and fruit; but is ill-peopled, and worse cultivated.

The duchy of Castro and the earldom of Ronciglione was conferred by pope Paul III. on his natural son Peter Aloysius Farnese, who afterwards became duke of Parma and Placentia. His descendants held this country as a fief of the papal chair, till Adoard mortgaged it to the Monte di Pietà at Rome; but paying neither principal nor interest, pope Urban VIII. sequestered the land, and took upon himself the liquidation of the debt. Adoard, indeed, afterwards found means to make himself again master of the country; but it was taken from his son by pope Innocent XI. and the money lent not being repaid at the appointed time, this duchy was, in 1661, again annexed to the papal chamber. In 1664, Lewis XIV. king of France, prevailed on the pope to allow a farther term of eight years for the redemption of the land; but even when that was expired, nothing was effected. On the other hand, Don Carlos laying claim to it in 1732, offered to pay the loan; but the pope refused to agree to it, and it continues united to the papal dominions.

The principal places in this duchy are the following:

Castro, formerly a genteel city, and a bishop's see; but the inhabitants having murdered the bishop sent them by pope Innocent X. his holiness, in 1646, removed the bishopric to Aquapendente, and ordered the town to be demolished.

In this duchy are also Farnese, Montalto, Valentano, and other small places. To this duchy likewise belong the islands of Bisentina and Mantana, which lie in the lake of Bolsena. Each has a church; and in one of them it was that Amalasunta, daughter to Theodoric king of the Ostrogoths, was kept prisoner by her cousin Theodat, with whom she had shared the government, and afterwards, by his orders, was murdered while she was bathing.

St. Peter's Patrimony, formerly called Etruria Suburbicaria, was given to the see of Rome by the countess Matilda. This grant is said to have been made in the year 1077, under Gregory VII. and in 1102, renewed to Paschal II. But granting the truth of this account, it is evident such alienations to the prejudice of the Roman emperor and empire were not founded in justice.

This country is bounded on the north by Orvietano; on the east by Umbria and Sabina; on the south by the Campania of Rome; and on the west by the sea; it being about thirty-five miles in length, and thirty in breadth.

The principal places in this province are the following:

Bolsena, a small town, most delightfully situated near the lake of the same name, which is thirty-five Italian miles in circuit. The mountains which environ it are covered with oaks, and afford the prospect as it were of an august amphitheatre. Here is said to have been wrought by a host the miracle which gave occasion to the institution of the festival of *Corpus Christi*. Near this place are seen, on an eminence, the ruined walls of the Etrurian city Volturnum.

Monte Fiascone is seated upon a mountain; but would be little known, were it not on account of its white muscadell wine, which, however, seldom comes to perfection. Its bishopric is incorporated with that of Corneto, and immediately subject to the pope. Near this city, in the church of St. Flavian, is a monument said to be erected to the memory of a German, who unhappily was so delighted with the wine of this city, that he drank himself into a fever, which soon carried him off; but has the honour of being buried before the altar, he having left six hundred scudi, or a hundred and twenty-seven pounds ten shillings sterling, to the church and the

poor, the interest of which is annually distributed to the poor in bread and cheese.

Viterbo, the capital of the country, is situated in the forty-second degree twenty minutes north latitude, and in the twelfth degree thirty-nine minutes east longitude, and was given to the pope by the empress Matilda, in memory of which donation an inscription on stone is fixed on the town-house. This city lies in a beautiful and fertile valley: it is large, the streets for the greater part are broad and well paved, and the houses are handsome. The inhabitants, however, scarce amount to fifteen thousand, though there are sixty-nine churches, convents, and hospitals. The bishop is immediately under the pope. Among the several fountains in the city, that in St. Lucia's square is justly admired as the most elegant for the workmanship, and affords the best water. In the cathedral are the monuments of four popes. The Franciscan nuns pretend to shew the body of St. Rosa di Viterbo, which is uncorrupted, and dried up like a mummy. At the distance of an Italian mile from the city is a handsome church dedicated to the Virgin, with the surname *della Quercia*, resorted to by a great number of pilgrims; and near it is a Dominican convent.

Here are two academies; one styled *Gli Ostinati*, or the Obstinate, whose emblem is a pyramid beat on every side by the winds, and the motto *FRUSTRA*: the other, styled *Gli Ardenti*, the Fiery, whose emblem is an ingot of gold in a crucible over a furnace, with the motto *DONEC PURUM*. The government of this place is commonly given to some favourite bishop or cardinal, who is obliged to keep a noble house and equipage, and to entertain all the cardinals and men of a public character that come hither. The town is divided into sixteen parishes. Some good hospitals are likewise here, especially those for orphans and foundlings.

At the distance of two or three miles to the north-east of Viterbo, stands a most delightful villa belonging to the duke of Lanti, which has this peculiar advantage, that of the many dukes who have succeeded each other in this seat for some hundred years past, not one has neglected to improve it; and accordingly this palace abounds in fine pictures, antique statues, and rich furniture; and nothing of the kind can exceed the fountains, grottos, canals, walks, arbours, and groves, in the gardens.

The adjacent country is naturally rich and fertile, and where it is well cultivated, produces great plenty of corn, oil, fruit, rice, and pulse; notwithstanding which, except where there are some villas, it is a perfect solitude, without houses or inhabitants, and the very roads so unfrequented, that one may ride many miles without meeting any body.

Civita Vecchia, a fortified sea-port, and the best in the papal dominions, is seated in the forty-second degree ten minutes north latitude, and in the twelfth degree ten minutes east longitude, and obtained its name in the following manner: in 854, pope Leo IV. built a new town, which, from its own name, he called Leopolis, and peopled it with the inhabitants of Centumcella, which the Moors had sacked; after some time the inhabitants returning to their former place of abode, repaired it, and hence it was called Civita Vecchia, or the Old Town. The remains of Leopolis are still to be seen at six miles distance. Pope Urban VIII. caused this city to be regularly fortified, and besides, it has a strong old castle, that stands by itself in the sea. The port is not quite sheltered from all winds, but has a spacious dock for ships, and an artificial mole, at the end of which is a strong high tower, which at once defends the entrance into the port, and serves as a light-house. The place is in good condition, but thinly inhabited, the air being unwholesome, and good water very scarce; but this last inconvenience has in some measure been remedied by means of a canal. Here are some good churches and other edifices, and here commonly lie the pope's galleys. This city would greatly lessen the trade of Leghorn, was it declared a free port.

Civita Castellana is a small town, of mean appearance, situated on a very high and steep rock, near the confluence of the Frigia and Tevere. This was the ancient Falerios, once the capital of the Falisci. Its bishopric is united

united to that of Orta. Pope Clement XI. caused a bridge of an uncommon height to be built here, by which the rock on which the city stands, has a communication with the opposite mountain; so that a person may cross directly over, without going down into the valley, which is of a considerable depth.

There are several other towns in this district, none of which deserve a particular description.

The earldom of Ronciglione, which is entirely included in St. Peter's Patrimony, belongs to the duke of Parma. Ronciglione, the principal town, is but small; and is seated at a small distance from the Lago di Vico, anciently called the lake of Cyminus.

The palace of Caprorola, which belongs to the duke of Parma, stands at the distance of ten Italian miles from Viterbo, in the way to Rome, but out of the post road. It was built in the sixteenth century, by cardinal Alexander Farnese; its outward figure is a pentagon, resembling a citadel; but the inward court, which has a gallery round it, is quite circular, and yet the apartments are square and well contrived. The whole art of this singularity consists in the different thickness of the walls. The top of this structure affords a prospect as far as the city of Rome, which may be perceived, though at twenty-eight or thirty miles distance. In this palace is a most superb stair-case, and it is likewise famous for a whispering-hall, in which four persons standing close to the wall, opposite to each other, may converse without being heard by a fifth standing in the center. A stamp with the foot on the floor of this hall, sounds to those who are without, like the report of a pistol. Several apartments have their ceilings and friezes painted by the two Zuccaros, who, particularly in the cardinal's bed-chamber, have shewed their admirable skill and judgment.

The gardens of Caprorola are also elegantly designed, and finely embellished with proper ornaments.

S E C T. XIII.

The CAMPAGNA DI ROMANA, or CAMPANIA of ROME.

Its Situation, Extent, and fertile, but desolate soil, with a particular Description of the City of Rome, and the Manners and Customs of the Inhabitants.

THE Campania, or territory of Rome, anciently called Latium, is bounded on the north by Sabina; on the east by Abruzzo; on the south by Terra di Lavoro; on the south-west by the Mediterranean; and on the west by the Mediterranean and the Tyber; extending sixty miles in length on the Mediterranean, to the frontiers of Naples.

It is divided into Campania Proper, which lies on the north side between the river Anio, and the ridge of the mountains of Segni, and is a very mountainous tract, and into the southern or maritime side, called la Marina; which extends from east to west, between those mountains and the sea-coast.

The waters of this territory are generally very good, especially those of the Tyber. Here are also two other rivers, the Numico and Astura, and several lakes.

This country is blessed with a very fertile soil, but for want of cultivation the inhabitants are wretchedly poor. It has delicious plains of considerable extent with scarce so much as a village, so that the few inhabitants are obliged, in order to get in their harvest, to employ the peasants of Viterbo, Perugia, and other hilly parts of St. Peter's Patrimony. It is, however, observable, that, in general, the plains are not the places chosen for building; but rather the hills, for the sake of coolness. The air is here very unwholesome, which is partly occasioned by the fens and lakes, the indolence and sloth of the inhabitants, who take no pains either to drain the marshes or to cultivate the dry lands, which are in a manner deserted, to which may be added, the many towns and villages that lie in heaps of rubbish, and harbour great quantities of stagnated water, which

contributes to corrupt the air. After the wind has been a long time in the north, and suddenly shifts to the south, or when a strong south wind blows, attended with cloudy weather, the season is very sickly at Rome; this is, however, an observation not peculiar to Rome, but to all Italy. That Rome itself is not remarkably unhealthful, may be concluded from the great number of its inhabitants, who live to a great age; and even one third of the cardinals are computed to arrive at their eightieth year.

Rome is a very ancient city, situated in the forty-first degree forty-seven minutes north latitude, and in the third degree five minutes east longitude, seventeen miles from the Tuscan sea. It was formerly considered as the capital of the whole world, and revered as the residence of its mighty emperors. Indeed, it may still be said to be the most remarkable city upon earth for pomp, noble edifices, antiquities, curiosities, the constitution of its court, and the importance of its history. In short, it is the center of all that is fine in sculpture, painting, and architecture.

The origin of Rome is dated 753 years before Christ, at which time Romulus first built on mount Palatine. Its figure and situation have been several times changed, especially since the seven principal sieges it sustained, in which it was sacked by the Gauls, Vandals, Herulians, Ostrogoths, the Visigoths, and the German armies, particularly in 1527, under the command of Charles of Bourbon. At present the seven hills on which it was originally built are scarce distinguishable, it standing rather on twelve, and being enlarged on one side, while other parts lie in ruins. Indeed modern Rome stands higher than the ancient, the present city standing upon the ruins of the former; and the earth being washed from the hills, the very cause that has raised the low grounds, has contributed to sink those that were higher.

It is environed with a brick wall, which probably is not of a more ancient date than the time of Belisarius, and is computed to be about ten Italian miles in compass; but not one half of this space is built upon, the places which once boasted the noblest structures being now wastes, gardens, fields, meadows, and vineyards. The greatest part of the ruins of ancient Rome is seen behind the Capitol. In the year 1714 the number of inhabitants, according to a list taken by order of Clement XI. was found to be one hundred and forty-three thousand.

In the beauty and magnificence of the religious buildings and palaces, modern Rome far surpasses the ancient. The parish churches alone amount to eighty. Most of the houses are of brick; but those of the better sort have the doors, windows, and supporters of free-stone. Upwards of two-thirds of the houses are the property of the churches, convents, and alms-houses, to which new purchases are continually annexed. The streets are well paved, and some of them with brick; but they are neither kept clean nor illuminated.

No place in the world is so well provided with fountains as this city, it having not only very good springs, but being supplied with water by means of some superb and stupendous aqueducts, the principal of which at present are those of Aqua Felice and Aqua Paulina; the former is conveyed thither from the district of Palestrina, at the distance of twenty-two Italian miles, and does honour to pope Sixtus V. its founder. It discharges itself at the Fontana di Termine, which was also built at the expence of Sixtus V. and consists of three arches, supported by four Corinthian columns, and the water gushes out at three apertures. Over the middle arch stands a beautiful statue of Moses striking the rock with his rod; over another arch is a basso relievo of Aaron leading the people to a miraculous spring in the wilderness; and the third shews Gideon trying his soldiers by their drinking at a river. Round it are four lions, two of which are of marble, by Vacca; the other two of oriental granate, and are said to be brought hither from a temple of Serapis; all the four lions eject water.

The Aqua Paulina, so called from its restorer pope Paul V. is conveyed the distance of thirty miles, and divides itself into two main channels, which supply different parts of the city.

These pure limpid streams are of singular benefit to the city, as the water of the Tyber is generally so thick and muddy, that even horses are not watered at it; but after two or three days standing, it works itself clear, and becomes fit for drinking. The bed of this river being raised by the many ruins of houses that have fallen into it, and its mouth much choaked up, it frequently overflows, especially with a strong south wind.

The academies and learned societies for the promotion of arts and sciences are very numerous, and among them are the academies of geography, history in general, the Roman history, church history, Roman antiquities, liturgical or old ecclesiastical rites and councils, which four last were instituted, or rather revived, by the late pope Benedict XIV. also academies of painting, sculpture, architecture, &c. some of which have whimsical titles, as, *li Fantastici*, *li Parthenici*, *li Lyncei*, *li Congregati*, *li Infecondi*, the Arcadians, &c.

It would be difficult to enumerate all the convents, chapels, oratories, hospitals, seminaries, &c. in Rome, we shall therefore only mention the principal.

St. Augustine's church is small and dark, but adorned with some fine paintings, among which is a picture of the prophet Isaiah, by Raphael, which is exceedingly admired. In the Pamphilii chapel is a statue of St. Thomas of Villa Nova, in white marble, who is represented giving alms to a poor woman suckling an infant: the drapery is esteemed inimitable, as is also the woman's face. The tabernacle on the high altar is made of amethysts, agate, jasper, and a variety of other gems, with fine pillars of alabaster, beautifully variegated with red and white, resembling flowers. On the high altar is a Madonna, said to be done by St. Luke; but Mr. Keyser observes, that he has seen so many of his pieces in different places, that it is difficult to conceive how that evangelist could find time for any thing else, and adds, that though people of a certain devotional taste place an inestimable value on these spurious pieces, he never met with a connoisseur who did not greatly prefer those of Raphael, Rubens, and Vandyke, to them. Even the famous painter Carlo Maratti, who was a sound catholic, made no scruple of declaring, that had he lived in St. Luke's time, he could have given him some necessary instructions for mending his hand.

St. Agnes's church, within the city, on the Piazza Navona, though not very large, is superbly embellished; and the palaces on both sides being alike in symmetry and architecture, add greatly to its outward appearance. It is of an oval figure, and within it are eight large Corinthian columns, of red and white marble, many bas-reliefs, of which those over most of the altars are of one block of marble, though very large. That on the high altar is a representation of the birth of John the Baptist, and contains a group of twenty figures, twelve of which are in alto-relievo. From this church you descend to the Loci Turpitudinis, as it is called, where St. Agnes was in danger of being ravished by two soldiers, when they were restrained by a sudden effulgence of light, and the hair of her head grew to such a length as to shroud her whole body and conceal her nakedness; which is represented in a marble basso-relievo, at an altar said to be erected on the spot. In this piece the beauty of the martyr's face is much heightened by her fear and modesty. The cupola of this church is finely painted; but is thought to be too much crowded with saints and angels.

The church of St. Andrea della Valle is famous for its fresco painting, especially the cupola, by Lanfranco, which represents the felicity of the saints and the glory of heaven, and passes for the noblest piece of the kind in the whole world. The finest chapel in this church is on the right hand, just at the entrance. Beside the rails of the altar of red and yellow marble, one sees every where a profusion of verde and nigro-antico, jasper, agate, and lapis-lazuli. The basso-relievos, and six marble statues representing so many virtues, are well worth seeing. Some of the other chapels are not inferior to this.

The front of St. Bibiana's church was designed by the chevalier Bernini, who also made the incomparable marble statue of this saint, which stands upon the high altar,

and is admired as the master-piece of that artist. Under this fine statue lies the saint's body in a sarcophagus, or coffin, of oriental alabaster; and near the church-door is a red pillar of Egyptian marble, with a Latin inscription, that to this pillar St. Bibiana was bound, when she suffered martyrdom, being whipped to death with thongs charged with lead.

St. Constanza fuori di Porta Pia is of a round figure, and the roof is supported by twenty-four pillars of oriental granite standing in pairs. The ceiling is of ancient Mosaic work, representing birds, grapes, and the pressing of them, from whence some conjecture that this was anciently a temple of Bacchus; while others maintain, that Constantine the Great erected this structure in imitation of the Lateran Baptistry, for the solemnity of baptizing the two Constantias, his daughter and sister. But what is most remarkable here, is a large coffin of a single piece of porphyry, four feet in depth, eight feet and an half in length, and above five broad. On the sides are carved wreaths, garlands, and boys with bunches of grapes, which is the more curious from the difficulty of working porphyry, on account of its hardness. The lid is also made of one piece, but damaged. Some think this to have been the tomb of Tulliola, Cicero's daughter; and others will have it to be that of Tullia, the wife of Tarquin the Proud.

The Jesuits church is one of the finest in Rome; the front is of a kind of free-stone found near Tivoli, adorned with Ionic and Corinthian columns. It has several magnificent chapels, the most noble of which is that of St. Ignatius Loyola. The pavement about the altar is inlaid with festoons and flowers of the finest gems; the steps are of porphyry and other costly marble; and the place where the priest stands before the altar, is of inlaid work of polished gems. Under the table of the altar lies the body of St. Ignatius, in a coffin of brass gilt, and by means of a lamp burning behind it, the name of JESUS of inlaid crystal in the front emits a great lustre. The front of the altar on festivals is covered with solid silver, but has an aperture through which the coffin and radiant name may be seen. A little above the table are two gilded angels, holding St. Ignatius's motto, *ad maiorem Dei gloriam*, that is, "To the greater glory of God," of lapis-lazuli. On the altar-piece are four fluted columns, which, exclusive of the pedestals and capitals, which are of brass gilt, are twenty-eight feet in height, inlaid with lapis lazuli. Over the altar is a picture painted on wood, which may be lowered, and then exhibits a silver statue of St. Ignatius Loyola, which stands behind it, the drapery of which is gilt and enriched with pearls and diamonds. On each side of the altar is a fine group of statues in Carrara marble; one represents the Christian religion destroying idolatry, which is represented by a serpent blasted with lightning, and near it is the king of Bungo in Japan, submitting to the Christian faith. In another group Religion is seen treading on a Fury and Heresy, who has a snake in her hand, and near her lie three books marked with the following titles: Martin Luther, John Calvin, Huldreich Zwingli.

St. Peter's in the Vatican, both for size and beauty, may be called the metropolitan church not only of Rome and Italy, but of the whole world. Here may be seen to what an amazing pitch the Romish church, which is so fond of external pomp and splendor, has within two centuries carried its favourite scheme of captivating the senses, and inspiring the minds of the ignorant with awe and submission to the clergy. Fontana computes that in his time it had cost above eighty millions of Roman scudi, about two millions sterling.

Nothing can be imagined more grand and superb than the area before the church. The oval colonnade round it has four rows of columns, forming three separate walks. This colonnade consists of three hundred and twenty columns made of Tivoli free-stone, so large that three men can scarce grasp them. On the roof, which is flat, stand eighty-six statues of so many saints, twice as big as the life, all designed by Bernini. The area is adorned with two stately fountains, and in the center stands the vast granite obelisk which formerly belonged to Nero's Circus, and in Caligula's time was brought

Hooker Sculp.

A View of St. Peters at Rome.

brought from Egypt to Rome, though it is said to weigh nine hundred and ninety-two thousand seven hundred and eighty-six pounds, and the height of it is eighty feet, exclusive of the base, which is thirty-seven. Four lions which support the obelisk are placed on the pedestal, and are of gilt bronze. The cross on the top, which is seven feet high, and is of gilt brass, is said to have in it a piece of the cross on which Christ suffered; and whoever, in passing by it, says a Pater Noster, and Ave Maria, for the prosperity of the see of Rome, is entitled to an indulgence for ten years, and ten times forty days. The steps from the area up to the church have at the bottom on each side the statues of St. Peter and St. Paul. At the top of these steps is a grand portico two hundred and sixteen feet in length, and forty in breadth. Eight columns scarcely to be grasped by five men, together with several others of fine Teverino stone, support the architrave. On each side of the five entrances into the portico stand two Ionic columns of purple marble. The portico itself is paved with the finest marble, and the ceiling is embellished with stucco-work and gilding. On the right hand near the steps is an equestrian statue of Constantine the Great, whose joy and surprize at the appearance of the effulgent cross in the sky is admirably expressed. Opposite to this on the other side is an equestrian statue of Charlemagne cut out of a single block of marble. From the portico four doors open into the church, of which the farthest on the right hand is walled up and opened only once in twenty-five years, that is at the jubilee, and then the ceremony is performed by the pope himself with a hammer.

This incomparable church is built in the form of a Latin cross, and the proportion is so exactly observed in the length, height, and breadth, that the eye cannot perceive any thing extraordinary large in any of the three dimensions, though the whole taken together be of an uncommon bulk and extent. The breadth of the middle isle, which runs the whole length of the church, is eighty-six English feet; but the whole breadth of the church, exclusive of the thickness of the walls, is two hundred and ninety-one feet. Its length to the cross isle is four hundred and thirty-eight feet, and its breadth seventy three. The height of the church, from the pavement to the roof, is one hundred and forty-four feet. It is universally agreed, that the cupola is a work of astonishing art and grandeur. The height from the pavement of the church to the top of the cross, is four hundred and thirty-two feet. The outward circumference of the dome is six hundred and twenty feet, and the inward diameter a hundred and forty-three. This dome was built under the pontificate of Sixtus V. The honour of the undertaking and the design is owing to the great Michael Angelo, who hearing some persons crying up the Rotunda as a work of antiquity never to be paralleled, said he would not only build a dome equally large, but build it in the air. Giosoppe d'Arpino drew the designs for the Mosaic ornaments of the cupola, among which the four Evangelists, in four large oval compartments, are particularly admired. This amazing structure rests on four pillars, each of which is adorned with a white marble statue, over which is a gallery, from whence several times in the year the relics, which are kept in a particular chapel, are exposed to public view.

To return to the entrance, at the two first pillars, which stand opposite each other, are two shells or basins of yellow marble for holy water, held out by two angels of white marble. This work is large and beautiful. The high altar, at which the pope alone is to officiate, stands in the middle of the cross isle, and directly under the center of the cupola, and first attracts the eye. Over this altar is a canopy of gilt bronze, embellished with four angels and a crucifix, and resting on four large twisted brass pillars. There are a great number of chapels finely ornamented with sculpture, painting, and the most beautiful Mosaic work.

The farther end of the church is taken up with the altar of St. Peter, where they pretend to have the wooden pulpit of that apostle inclosed in another of gilt bronze, and supported by the statues of St. Chrysostom, St. Athanasius, St. Augustin, and St. Ambrose, all four very large and of gilt bronze, standing on four stately marble pedestals. Over the pulpit is a glory of the same metal.

and in the center the Holy Ghost in the form of a dove. Before this altar stands a large bronze lamp made by order of Clement XI. who granted to all the religious orders the privilege of having the image of their founders placed here. The statue of St. Dominic is cut out of a single block of marble, which, before it came into the sculptor's hands, cost two thousand crowns. His countenance and attitude express the vehemence and rigour which influence his disciples in the proceedings of the inquisition; and at his left side is a dog, with a flaming torch, which is the arms of that dreadful tribunal. Opposite to it is the statue of St. Francis; but the other orders have not yet taken advantage of the pope's grant.

In short, the altars of this church amount to twenty-nine. The pavement is entirely of marble, and there are in this church about a hundred and eighty large marble pillars; the square pilasters are incrustated with red marble, adorned with white medallions and busts of the popes. Every thing is kept with such neatness and order, that it looks like a new-built church, and upon the least appearance of any dust on the walls and ceiling, people are drawn up in machines, who wipe it off with linen cloths.

Adjoining to St. Peter's church, on the north side, is the spacious palace of the Vatican, in which are said to be twelve thousand five hundred and twenty-four rooms. But this palace having been built and enlarged at different times, there is not the least symmetry observed in its several parts, and, to avoid damaging the fine area of St. Peter's church, it has not so much as a portico in front. Over one of the doors is a Mosaic work of the Virgin Mary, with St. Peter and St. Paul. From hence, by ascending a pair of stairs, which lead to the grand apartments of the palace, you have a view of three galleries over each other, in which Raphael immortalized his name by his amazing skill. The middle gallery leads into an apartment called Raphael's Bible, from the histories of the Old and New Testament, painted by that great artist. This gallery is divided into several vaulted compartments, each filled with exquisite painting in fresco. Among these pieces the portrait of Eve, by Raphael, is much admired. The Judgment of Solomon is a capital piece, as is also the Lord's Supper.

But the place where Raphael's skill shines in its greatest glory, is the Camera della Signatura, and the three adjoining rooms. The first of these apartments has four large emblematical pieces. The first contains the chief articles of the Romish faith, the Trinity, Transubstantiation, &c. the second the Sciences, with the progress of the human mind in philosophy, mathematics, and astronomy, on which account this piece is usually termed *The School of Athens*: the third is of poetry; and the fourth of justice, prudence, and other moral virtues.

Over the door of the Sala Ducale is an angel holding the keys, and another the papal crown. In this apartment, which was designed by Bernini, the pope on Maunday Thursday washes the feet of thirteen poor priests of different nations. The stucco curtain, which seems tied to the ceiling, is so happily executed, that it has all the appearance of white silk, embroidered and fringed with gold. Here the pope also holds consistories, and gives audience to the ambassadors of crowned heads.

The Sala Regia opens into the chapel of Sixtus IV. and is a spacious room, with a beautiful pavement of inlaid marble. The hangings are very fine, and the prophets, sybils, and other paintings in fresco on the ceiling, are by Michael Angelo; but the piece most admired is that of the last judgment by that admirable artist, who has introduced such a multitude of figures, with their limbs and attitudes so accurately delineated, that one would imagine his chief intention was to display his exact knowledge in anatomy. But on this solemn occasion he has ridiculously introduced the heathen fables of Charon and Minos.

The summer apartments of the pope are usually hung with crimson silk damask, and those for winter with velvet. In most of the rooms are to be seen several wooden chairs and benches painted green and varnished, which under all the revolutions of the state remain unaltered, only on the accession of a new pontiff to the papal chair the name and arms of the deceased pope are taken away to make room for those of his successor. The cardinals and ambassadors at an audience sit on chairs, and princes

on the like occasion sit upon three cushions laid upon one another; whilst persons of an ordinary class kneel. In the audience-chamber on each side of the papal throne is a red stool for kings; but for these two last centuries crowned heads have not been ambitious of that honour: even the pretender to the British crown never had any other than private audiences of the pope, and then sits in an arm-chair.

It is observable, that several of the stair-cases of the Vatican, if they may be so called, are either without or with very low steps; so that wood, water, and other necessities may be carried up and down by asses.

The Vatican library is extremely famous. It is not indeed very remarkable for printed books, the whole number scarce amounting to more than twenty thousand volumes; but in excellent manuscripts, of which it is said to contain above twenty-five thousand, it is esteemed the most valuable in all Christendom.

Directly under the library is the armoury, built by Urban VIII. and is said to contain arms for forty thousand men; but being chiefly such as were used in antient times, they are now of little use.

In the middle of the palace is a spacious square surrounded with orange trees and antique statues, the most famous of which is that of Laocoon, which is said to have been performed by those excellent artists Agasander, Polydorus, and Athenodorus, natives of Rhodes. In this group Laocoon is represented in the greatest agony with his eyes lifted up to heaven: near him are his two sons, with serpents twined about them, who are at some distance from their father, and expiring when he comes to their relief.

As the Vatican joins on one side to St. Peter's church, on the other a colonnade leads to the castle of St. Angelo. This castle was formerly the burial-place of the Roman emperors, and a large round tower in the center of the edifice was once adorned with a considerable number of marble columns and statues; but most of them were broken by the Romans, who made use of them against the Goths, when they assaulted the city. When Rome was visited with the pestilence in the reign of Gregory the Great, in a general procession, where the pictures of the Virgin Mary, painted by St. Luke, were carried, the pope, it is pretended, saw an angel directly over the castle; who, upon the pope's looking up, sheathed his flaming sword. This Gregory supposed to be a sign of the cessation of the divine wrath, and therefore built a chapel in honour of the angel, ordering the place itself to be called *Castellum St. Angeli*, or the Castle of the Holy Angel. Rome being without a citadel, or any regular fortifications, this castle has been rendered a place of security, and fortified in the modern way, with five regular bastions, ramparts, moats, &c. The governor is appointed by the pope, and is generally a prelate, who enjoys other considerable offices; the garrison consists of two hundred regulars, and some hundreds of citizens. In this castle is a handsome hall adorned with gildings, fine paintings, and Adrian's statue. The apartment to which Clement VII. withdrew, amidst the disturbances which he had brought upon himself, by provoking the emperor Charles V. is at present a state prison for persons of rank, who, through a small window, may look into the chapel and hear mass. On the top of this structure stands an angel of white marble about twelve feet high.

The church of St. John de Lateran is so called from its chapel of St. John the Baptist, and the Roman martyr Plantius Lateranus, put to death by Nero, who had a garden in this place. It is of an octangular figure, and bears the title of the head and mother of all churches; and as it is one of the four churches enjoined to be visited every jubilee year, it has a gate walled up, which at the commencement of that year is opened by the cardinal arch-priest. On the feast of St. John the Baptist here are plenary indulgences for twenty-nine thousand years. The pavement of this church is of fine inlaid work, interspersed with circular pieces of porphyry. Both here and at St. Peter's are confessionals for different nations; and, by proper inscriptions over them, every one may know where to apply to a priest who understands his language. The roof is very richly gilt, and the cupola is adorned

with eight pieces of painting, by Andrea Sacchi, and the painting in fresco in the church by Carlo Maratti, Gimignani, Camassei, and Magnoni. Along the middle aisle are twelve large statues of the apostles, each cut out of a single block of white marble, and done by the best masters. There are two pillars of verde antico between every two of these statues. Over them are basso-relievos; and above these are the pictures of as many of the prophets.

Before this church is a beautiful fountain, and the largest obelisk in Rome, it being, exclusive of the pedestal and the iron cross on the top, a hundred and twelve feet in height, and two of the sides ten feet and a half, and the other two eight feet in breadth near the base. At first it consisted of a single piece of Egyptian granite, and stood in the Circus Maximus; but amidst the subsequent wars and commotions it was broken into three pieces, and lay on the ground till the year 1588, when Sixtus V. gave directions to his architect Fontana, to remove it thither, and set it up again. The Egyptian hieroglyphics upon it have afforded the learned a large field for exercising their skill. The vestry of the Lateran church leads to the cloisters of the convent, which, on the side towards the inward court, have an elegant variety of small white marble pillars. Both here and in the church are a multitude of fictitious relics not worth describing.

On the other side of this piazza, or square, is the Lateran hospital, a handsome and well contrived building, where some hundreds of patients of both sexes are carefully attended, and commodiously lodged. In this square is also to be seen the *Scala Santa*, or holy stairs, said to be those of Pilate's house, which Christ frequently ascended, before he was led to be crucified, which nobody are permitted to ascend but on their knees: however, there are stairs on each side, by which men are allowed to walk up to the *Sanctum Sanctorum*, or Holy of Holies, a small chapel at the top, in which are abundance of reliques belonging to the Lateran palace. The most remarkable of these is a picture of Jesus Christ, begun, as it is pretended, by St. Luke, and finished by an angel. Any person scrupling to pay the required adoration to this picture, are not admitted to see it; nor are women ever admitted beyond the gate where it is kept.

The Pantheon, from its circular figure called the Rotunda, dedicated by Boniface IV. to the Virgin and all the martyrs, and by another pope to all the saints as well as the martyrs, is one of the most beautiful and entire pieces of antiquity in Italy, and several of the niches are still remaining that antiently contained the statues of the gods. The outside of the building is of Tivoli free-stone, and within it is incrustured with marble. The roof of the Pantheon is a round dome, without pillars, the diameter of which is a hundred and forty-four feet; and though it has no windows, but only a round aperture in the center of the dome, it is very light in every part. The pavement consists of large square stones and porphyry, sloping round towards the center, where the rain-water falling down through the aperture on the top of the dome, is conveyed away by a proper drain, covered with a stone full of holes. Eight altars are placed round this church, among which the high altar is of porphyry. The colonnade in the front, which consists of sixteen columns of granite, thirty-seven feet high, exclusive of the pedestals and capitals, each cut out of a single block, are of the Corinthian order, and cannot be viewed without astonishment. The entrance of the church is adorned with columns forty feet high, and the architrave is formed of a single piece of granite. On the left hand, on entering the portico, is a large antique vase of Numidian marble; and in the area before the church is a fountain, with an antique basin of porphyry.

The Campidoglio is a superb structure, built on the spot where the antient Capitol stood, by the great Michael Angelo. The steps that form the ascent are low and of an extraordinary breadth, and at the bottom on each side is a sphynx of Egyptian marble ejecting water. On the top of the ascent are two large antique statues of Castor and Pollux on horseback, facing each other; these are antient trophies, generally thought to have been raised for Caius Marius, fixed on new pedestals. Farther on

on is an antient mill stone, and opposite to it, for the sake of regularity, is another antique pillar, with a globular urn on the top, in which Trajan's ashes are said to have been deposited. In the middle of the area Paul III. erected an equestrian statue of the Roman emperor Marcus Aurelius Antonius, which formerly stood in the church of St. John Lateran. The pedestal is very grand, it being the work of Michael Angelo. The owl on the horse's head is an emblem of the emperor's wisdom and vigilance, that bird being sacred to Minerva. These statues, with the steps up the ascent, all placed there by different popes, give this place a grand appearance.

In the place where the antient Capitol stood is a very magnificent palace, the roof of which is flat, and adorned with many statues of illustrious persons among the Romans. In the front of the building is a high tower, with the statue of Religion erected on the top. The double flight of steps at the entrance of this palace is the work of Michael Angelo; who likewise added to the beauty of the front by a superb fountain, adorned with two statues, representing the Nile and the Danube in a reclining posture. In the center is a porphyry statue of Rome, in the habit of Minerva, represented sitting. This is a piece of great antiquity, and is universally admired by connoisseurs. In the rooms are great numbers of curious antiquities, with the noblest antique statues, and paintings by the greatest masters. In the main building resides the senator of Rome, who daily administers justice there; and in the wings are the apartments of the conservators of the city.

As the churches of Rome are remarkable for their architecture, painting, and sculpture, these also distinguish the palaces of the princes and nobility of this city; for an Italian prince setting little value on equipages, liveries, entertainments, and the like, places his grandeur in adorning his palace with the most noble decorations.

The Barbarini palace is exceeded only by the Vatican, and contains four thousand rooms, adorned with an amazing number of statues and paintings, and among the former is a remarkable statue of the consul Brutus holding in his hand the head of his son, whom he had sentenced to die. Severus Septimus in bronze is highly esteemed, and a Narcissus in marble is much admired.

At the palace Justiniani, the catalogue of the antiquities amount to eighteen hundred and sixty-seven pieces, of which six hundred and thirty-eight are curious pictures: the most excellent of them are, Nero's head, Minerva, Venus coming out of a bath, and three little Cupids sleeping, and leaning one upon another.

Cardinal Chigi's palace is scarce inferior to any in Rome. The gates are crusted over with old green marble: the statues of the two Venuses, of Marsyas slayed, and the dying gladiator, are admirable pieces.

The Farnesian palace was begun by Antonio de St. Gallo, and brought to perfection by Michael Angelo. The front is a hundred and eighty feet in breadth, and ninety feet high; but all the principal stones of this beautiful structure were the spoils taken from the Great Coliseum, which admirable monument of antiquity has also furnished materials, not only to the palace of the chancery, and St. Laurence's church, but also to some part of the city walls. Thus Innocent VIII. destroyed the Gordian arch to build a church, and Alexander VI. that most beautiful pyramid of Scipio, to pave the streets with the stones. The Hercules and bull in the Farnesian palace are celebrated throughout the world, and the gallery by Caraccio, the hall by Sabriati, and the Venus and Adonis painted by Titian, are finely performed. But we have not room to mention the thousandth part of the beauties of the many palaces of this city, and shall therefore proceed to its celebrated antiquities.

Three brick arches of extraordinary size are still standing of the temple of Peace, built by the emperor Vespasian, which before it was demolished was esteemed the largest and most beautiful in Rome. Here the emperor Titus deposited the utensils he had taken out of the temple of Jerusalem after his conquest of that city.

The triumphal arch of white marble erected in honour of the same emperor, on account of his success in the Jewish expedition, is indeed much damaged; but the in-

scription on one side is still entire, and on it are represented the golden candlesticks, with seven branches, two jubilee trumpets, the table of shew-bread, and other utensils belonging to the temple of Jerusalem.

The triumphal arch of the emperor Constantine the Great of white marble is the best preserved of any from the injuries of time.

The columns of Trajan and Aurelius are magnificent monuments of antiquity, adorned with most excellent basso relievos, ascending in a spiral line from the base to the capitals. Aurelius's column is a hundred and eighty feet high, and exhibits a great number of basso relievos, representing the most remarkable actions and achievements of Marcus Aurelius. Within this column a stair-case, consisting of a hundred and ninety-two steps, winding in a spiral line, leads to a square gallery surrounded with an iron balustrade, from whence there is a most delightful prospect. The light is admitted into this pillar through fifty-two small windows. About fourteen feet higher than this gallery is a statue of St. Paul of brass gilt erected by Sixtus V. who caused the whole column to be repaired. The imagery in the upper part of the column is bigger than the lower; and this is almost the only instance of antiquity where the rules of perspective, with which the antients were but little acquainted, have been attended to. This pillar indeed is falsely called the Antonine; for from the basso relievos, among which are intermixed some circumstances of the Marcomanian war, it is evident that this monument was erected in honour of Marcus Aurelius, and not by him to his father Antoninus Pius. This error, however, passed current, till the genuine pillar erected to Antoninus Pius was found in 1704, half buried in rubbish. This last is of a red oriental granite, forty-four feet three inches high, and five feet eight inches in diameter. It is without ornaments; but the pedestal, which is of Parian marble, twelve feet long, and eleven broad, is an exquisite piece of work. On one side is the inscription, and on the other basso relievos representing the apotheosis of Antoninus and his empress Faustina, and likewise some horse-races.

Trajan's pillar is not only of a much larger size, but is adorned with bolder reliefs than that of Aurelius, and makes a very superb appearance. The grandeur of this column is still heightened by a noble pedestal representing a mass of huge rocks embellished with trophies of coats of mail, shields, &c. The basso relievos are carried round, and from the bottom to the top form twenty-three spiral circumvolutions. The subject is Trajan's expedition against Decebalus king of the Dacians, and they contain near two thousand five hundred figures, but with so little regard to perspective, that those in the rear of a corps appear as large, and as full in view as those in the front. The stair-case within consists of one hundred and eighty-four steps, and is very light by means of forty-three apertures or windows properly disposed. Anciently stood either Trajan's statue, or an urn with his ashes on the top; and "where, says Mr. Addison, could the ashes of an emperor have been so nobly lodged as in the midst of his metropolis, and on the top of so exalted a monument, with the greatest of his actions underneath them? or, as some will have it, his statue was on the top, his battles in the midst, and his urn at the foundation." However, whether it was his urn or his statue which was on the top, it has been obliged to give place to a brass gilt statue of St. Peter. This pillar is of marble, and the whole, including the pedestal, consists of thirty-four pieces.

The amphitheatre of Titus, notwithstanding it has greatly suffered by the injuries of time, is not to be beheld without astonishment. The whole edifice is of Travertine stone, with four galleries over each other, adorned with columns of the Doric, Ionic, Corinthian, and Composite orders. This structure was one thousand six hundred and twelve geometrical feet in circumference, and its external figure circular; but the inside was oval. A great quantity of stone has been taken from this ancient edifice, for building several palaces; but some say that only such stones were carried away as had been thrown down by the weather or by earthquakes. However, not the least care is now taken to preserve this noble structure,

ture, and the area within it is overgrown with grass and weeds. According to the most exact computation, this amphitheatre was capable of containing thirty-four thousand persons, exclusive of those in the upper gallery; and according to Dion Cassius, nine thousand wild beasts were killed within its area at its dedication.

On one side of the Porta Ostia is a pyramid designed for a monument of Caius Cestius, one of the seven Epu-lones, or officers whose business it was to furnish banquets for Jupiter and the rest of the gods. This structure is built with brick, and encrusted with marble. It is one hundred and ten feet high: each side of the base is eighty one foot and an half square, and it has several inscriptions. At the entrance of this pyramid are two fine marble pillars, and within it an apartment with a Victory painted at each corner.

Of the temple of Concord, eight oriental granite pillars of the Ionic order are still to be seen behind the Capitol towards Mount Palatine. It was erected as a memorial of the reconciliation of the people and nobility at Rome.

At a small distance are to be seen three pillars, by some thought to be the remains of the temple of Jupiter Tonans, or the Thunderer, and by others that of Julius Cæsar.

The temple of Minerva stood in Nerva's Forum, where the front, embellished with fine basso-relievos, is still remaining. In one bass-relief the goddess is herself represented.

Among the other noble remains of antiquity, we ought not to omit the temple of Peace, of which three detached parts that are roofed are still remaining. The roof is divided into a great number of octangular apartments, formerly said to have been plated with gold. This temple was rebuilt by Titus on the successful conclusion of the Jewish war, and splendidly adorned with the spoils brought from Jerusalem. Herodian gives an astonishing account of its riches, and when in Commodus's time this temple was burnt by lightning, the melted silver and gold is said to have flowed out in a stream two hundred feet broad, and three hundred in length. At present a market for cattle being kept every Friday at this place, this famous temple is parted into several divisions, and let out by the apostolic chamber to graziers, as an enclosure for their bullocks, &c.

The catacombs of Rome are not single vaults, but rather whole subterraneous cities, with turnings and windings like streets, extending under all the suburbs. They are dug out from among the rocks, each passage being commonly fifteen or eighteen feet wide, and between twelve and fifteen feet high. The hollow niches on both sides of the walls are shaped like chests of various sizes, placed in rows one above another without any coffins, and only covered with flat stones like tiles, cemented with mortar. These were the burying-places for such of the Romans as could not afford the expence of burning; and the primitive Christians, who never burned their dead, made use of them for the same purpose.

It would make a volume larger than this is intended to be, were we to describe the antiquities and modern buildings of this city. We shall therefore leave this subject, and only take notice of some noble foundations, one of the most singular of which is the Monte della Pietà, which is intended to prevent excessive usury, money being lent on pledges at two-thirds of the value, and to the amount of thirty scudi without any interest; but larger sums at the moderate interest of two per cent.

The hospital for poor children is so large, that the front towards the Tyber is an hundred paces long, and four stories high. This is a most admirable foundation for bringing up orphans, who are allowed to choose their trade; and when they are twenty years old, and able to maintain themselves, they are dismissed from the house, new clothed from head to foot, with twenty crowns in their pockets. Very good tapestry is made here, and such boys as have a remarkable genius, are instructed in drawing for two or three years, and spend about the same time to obtain a thorough knowledge in tapestry weaving. In this hospital are also admitted old disabled servants, and other persons who by age and infirmities are rendered in-

capable of earning their bread. Besides these, there are many other charitable foundations.

The court of justice is one of the noblest buildings in Rome, and in the gallery of the first floor facing the court is a marble group of a man slaying one of his own species: whether this be Marsyas, says Mr. Keyser, who was punished for his presumption by Apollo; or whether it be an emblematical representation of the miseries of a client in the hands of a rapacious lawyer and iniquitous judges, I shall not pretend to determine.

The two custom houses are also stately buildings: these most travellers are obliged to visit much against their own inclination. The contraband goods for which the greatest search is made are tobacco, prohibited books, and new linen; but a piece of money and a readiness to open one's baggage seldom fail to make matters easy.

The French academy was founded by Lewis XIV. for twelve young gentlemen natives of France, six to be instructed in painting, four in sculpture, and two in architecture, who are maintained at the expence of the French king; and when they have completed themselves in these noble arts, return to their native country. On Monday, Tuesday, Wednesday, and Thursday in Passion-week, a young fellow is fastened naked to a cross, who droops his head, as if he was just expiring, with several lamps placed round him, while the scholars and other artists are employed in copying from the life; some designing on paper, others working in plaster, and expressing the attitude, muscles, veins, &c. of the object before them: but when a stranger goes away, this fellow quickly leaps down from the cross, and importunes him for a piece of money. In this academy one has an opportunity of viewing excellent copies of the best pieces, both of ancient and modern artists. The statues and pieces of sculpture are mostly of plaster; and among these are the wild boar in the Florentine gallery, the wrestler, and the Venus of Medici, in the Tribuna of Florence; the hermaphrodite in the Villa Borghese; the Barbirini, Laocoon, Apollo, Antinous in the Belvedere; a faun, a centaur, busts, &c. without number: with many fine pieces of painting.

Here is also an Italian academy of painting.

With respect to the manners and customs observed in this city, the people take great care to preserve themselves from the heats, which are usually in summer very troublesome; for which purpose persons of quality have low apartments, shaded from the rays of the sun, paved with marble, and furnished with fountains and water-spouts; and besides, the doors and windows are so contrived, that they are never without a kind of cool breeze. The beds are encompassed at some distance with a curtain of gauze or tiffany, which is joined close to the boards of the floor and ceiling, to prevent their being troubled with gnats. It is also the custom to sleep two hours immediately after dinner; but they never lie down, for they have a sort of folding chairs, which have backs that rise and fall with a spring. The use of umbrellas is common every where: the evening dew in the Campagna di Roma is esteemed mortal, during three or four months in the summer, and great care is taken to avoid it; for this purpose travellers double their pace, to arrive at Rome in time, or stay at the distance of eighteen or twenty miles from it.

The way of living at Rome was never so agreeable as at present, not a day passing without assemblies of both sexes at the houses of persons of quality; but unmarried women have not the liberty of appearing in public, they generally being confined in a convent, till they are either married or grown old.

The carnival at Rome affords a more agreeable entertainment to persons of an elegant taste than that of Venice; and should a prostitute dare to appear upon the Corso, her being discovered would expose her to very severe treatment. The Corso is a fine street, which extends two thousand seven hundred and twenty common paces in length. People appear there with or without a mask, in a carriage or on foot, just as they please. The coaches follow each other two a-breast, and the principal nobility make their appearance in triumphal cars, which add great splendor to the spectacle. The *sbirri* are post-

ed up and down to prevent disturbances, and their captain rides about bare-headed, till orders are obtained for horse-races, a diversion seen no-where but in Italy and the British dominions. Most of the racers in Italy are brought from Barbary, whereas England glories in the spirit and vigour of those of her own breed. In Italy, instead of being under the management of their riders, they are trained up to run alone: on the sides and along the back they have leathern straps, stuck on with pitch, and under these are iron bullets, set with strong points like the rowels of a spur, which continually prick the horses while they are in motion; and they have the cruelty to stick another of these spiked balls under the horse's tail. The starting-place is on the square called Piazza del Popolo, where the horses, being generally from five to eight in number, shew the utmost impatience for the signal, which is given by dropping a rope that runs a-cross the course before them. Upon this they start, and fly along the Corso with incredible swiftness, the coaches being drawn up on each side of the street. The prize is generally a piece of brocade, of the value of seventy or eighty Roman crowns. The people are entertained with such a race every day during the carnival.

Notwithstanding the splendor of the buildings of this city, the people have the disagreeable custom of drying linen out of the windows, and on ropes hung a-cross the streets.

The summers at Rome are very tedious, every body keeping close at home the whole day. Hence it is here a common saying, That none but dogs, idiots, and Frenchmen, walk the streets in the day-time. The heat of the climate makes the Romans extremely fond of spring-water, iced and cooling liquors; so that great quantities are consumed of snow and ice, which are fetched from the mountains, and preserved in ice-houses.

In autumn the vintage is a time of general festivity, when the common people give themselves up to all manner of licentiousness. The favourite winter diversions at Rome are plays and operas, and, during the carnival, the latter are acted at three theatres. One of these, called Alberti, from the count of that name, its founder, has a pit which will contain nine hundred persons, and is surrounded with seven galleries over each other.

With respect to the Roman customs in other respects, every prudent traveller should be on his guard, and rather talk too little than too much; for there are several private channels of information for conveying to the government's ear every thing that is said or done in the city. However, their conduct towards travellers is very prudent, from the consideration of their annually spending great sums of money in this city. At the meeting of the Host, and other processions, the Protestants need be in no fear of those brutal insults which they sometimes meet with in other countries, from the bigotted persecuting spirit of the vulgar. Besides, in Lent, and on other fast-days, the Protestants never fail of meeting with flesh-meat at the inns and taverns, without being at the trouble of procuring a licence for eating it.

Though public prostitutes are licensed on paying a small tax to the papal treasury, here are several regulations calculated to reclaim them: they are excluded from communion, and if they die in that profession they are denied Christian burial. In some parts of Italy they are obliged several times in a year to assemble in a particular church, where their vicious lives are painted in the blackest colours in a sermon preached before them; and they who are moved by the preacher's arguments, and in token of their repentance kiss a crucifix which is handed about, are conducted to a convent founded for their reception.

The Pretender to the British crown is, by order of the pope, stiled King of England; but this is no more than an empty title, which the Italians themselves make a jest of. Mr. Keyser observes, he has an annual income of twelve thousand scudi, or crowns, out of the pope's treasury, which is only three thousand pounds sterling; and though the clandestine remittances of his adherents in England may amount to as much more, it falls very short of what is required to keep up the state required in a king. He generally appears abroad with three coaches, and his household consists of forty persons:

but at his coming into an assembly, no English Protestant rises up, and even the Roman Catholics pay him their compliments in a very superficial manner: for his pusillanimity, and the licentiousness of his amours, have lessened him in every body's esteem. His lady seldom stirs abroad, except to visit a convent; and she allows her servants no gold or silver lace on their liveries.

S E C T. XIV.

Of the other Places worthy of Notice in the Campania of Rome; with a particular Description of the Villa Borgheze, Fiescati, the Belvedere, and Tivoli.

THE country in the neighbourhood of Rome is pleasant, but, like the rest of the Ecclesiastical State, thin of inhabitants; for along the delicious plains between Rome and Tivoli, Fiescati, Velettri, &c. neither town or village is to be seen; so that, in harvest time, the peasants of Viterbo, Perugia, and the mountainous parts of St. Peter's Patrimony, resort thither to help the few wretched inhabitants to get in their corn.

In describing the principal places in the Campania, we shall begin with the Villa Borgheze, which is seated in one of the finest spots in Italy, and may be said to exceed all other country seats in the world. It stands at the distance of a quarter of a league from Rome, and was built by cardinal Scipio Borgheze, nephew to Paul III. who has here assembled every elegant and splendid object of curiosity. In the gardens are at least twenty beautiful walks, and all the vistas are terminated by statues, large heads, or dragons spouting water. Here are also several groves of oaks, limes, cypress trees, pines, and pomegranate trees. The espaliers consist of myrtle, jasmine, and orange trees, &c. In other parts of the garden are little parks for deer and hares, and a warren for rabbits. Here is also a large canal stocked with swans, and all kinds of water-fowl. In two large and lofty aviaries, with fountains playing in them, are to be seen all of the known feathered species, and the flower-garden exhibits the most beautiful flowers and remarkable vegetables. On the grand area before the palace are twenty-four stone pedestals, finely carved, for flower-pots, with six ancient statues.

The house consists of a quadrangle, the four sides of which are embellished with statues and basso relievos. The double flight of steps leading to the first floor is adorned with two cornucopias, and vases embellished with basso relievos; and in the first court are a considerable number of ancient marble statues and bustos, with several fine basso relievos. The first room one enters is adorned with twelve columns of porphyry, granite, and the most beautiful kinds of marble. On the walls on each side are fourteen marble busts, which are those of Scipio Africanus, Hannibal, and the twelve Cæsars. A statue of Bacchus lying in the posture of a river god, is a masterly piece, as are the marble basso relievos over the six doors of the apartment, and the room is adorned with many excellent pictures. In the next room, among other fine pieces, is a celebrated antique statue of Seneca expiring in the bath, of black marble. The expression is exceeding natural, and the colour of the marble gives it a more melancholy appearance. The paintings both in this and in the other apartments are by the greatest masters, and it is impossible to describe the astonishing number of fine statues that are to be found in each of them.

The avenues about the house are adorned with the statues of Augustus, Commodus, Lucius Verus, Galba, Claudius, Perseus, Narcissus, several gladiators, a great number of busts, and several pyramids and obelisks of granite, &c.

Fiescati stands on a mountain about twelve Italian miles from Rome. In the way thither are to be seen the ruins of the Claudian aqueduct belonging to the emperors Gallienus's country seat, and the tomb of Alexander Severus. Fiescati is situated on or near the spot where the ancient Tusculum stood, and derives its name from the arbours or tabernacles built by the inhabitants of Tusculum, when their city was demolished in 1191. This charming retreat is at present the summer residence of several

veral persons of the first rank, who have here not only splendid palaces and gardens, but have taken the advantage of this favourable situation among hills for making very grand water-works. Indeed the seats of the Roman nobility at Frascati have been spoken of by travellers with a contempt which they little deserve.

The villa Aldobrandini, or the Belvedere, is remarkable for its fine water-works. They form a kind of theatre, and a brass globe, supported on the shoulders of Atlas, ejects water on all sides. Near this statue are a tyger and a lion fighting, and the water issuing from the mouth and nostrils of the former exactly imitates the snarling of that animal when enraged. The column of water in the center of the fountain rises seventy-four palms high, and is attended with a noise like the whizzing of sky-rockets. Among the statues is a Faunus playing on one of the ancient pastoral pipes, consisting of several unequal reeds, and a Centaur blowing a horn, which is said to be heard four Italian miles. The water which supplies these curious works is brought hither from a spring at six miles distance. Here is a beautiful saloon paved with fine small stones curiously arranged so as to represent flowers, foliages, and birds; and in the center of the pavement is a hole, over which a light globe or ball is kept in a perfect equilibrium, at the distance of a span from the floor, only by the impetus of the air forced up by water through the hole. The cascade consists of sixty-five steps, and on both sides are tortoises, dolphins, and other aquatic animals cut in stone, and spouting water at each other. The ceilings of the apartments in the house are painted in fresco by d'Arpino.

The gardens and palaces of several other noblemen at Frascati are also extremely beautiful.

Tivoli is seated on a hill, about eighteen Italian miles from Rome; but the road to it is entirely level. This town, however, is a very mean place, except only the villa Estense. In this palace is to be seen eight rooms on the ground-floor beautifully painted in fresco. Here is also a small marble group of the Nile, and twelve boys sporting about it. Formerly in the gardens were fountains adorned with the statues of Leda, Æsculapius, Arcthusa, Pandora, Flora, Pomona, and Antinous, with the grotto of Venus, &c. but they are now in a ruinous condition. However, most of the water-works are kept up; for as they are easily supplied from the Anio, they cannot be very expensive. The large basin just before the palace, with a statue of a horse in the center, furnishes a great quantity of water. Near this basin is a long row of some hundreds of pyramids, vases, eagles, and other figures, cut in stone, and fixed on pedestals, with basso relievos of stories taken from Ovid's *Metamorphoses*, and the water is ejected from all of them. This row of figures, being some hundred paces in length, is a very elegant ornament, and at the other end of it is a ship, with its masts and rigging, as it were engaged, and vigorously defending itself by ejecting water from all parts. The Girondola, or Dragon fountain, throws up a vast column of water. The water-organ, over which is a beautiful structure, adorned with statues and basso relievos, is also a curious work, and the steep cascade where the water precipitates itself from a considerable height without steps, is also in a good taste.

In the market place of Tivoli stand two large Egyptian idols of Oriental granite, supposed to be images of Isis, which the Tiburtines brought as a monument of their victory over the inhabitants of Norcia, though some maintain that they were brought hither from Adrian's villa within this town.

Near the fall of the Teverone, are the ruins of a temple of Vesta, or the Tiburtine Sybil, or according to others of Hercules; round which was formerly a colonnade of sixteen columns; but now only ten are remaining. The base of the portico has been well preserved, so that the festoons and foliages on the basso relievos still make a very beautiful appearance. The columns are of marble; but the work within only of brick. In the niches are some paintings in fresco; but as the Virgin Mary is to be seen here, it is evident that this building has been converted by the Christians into a church.

This hill affords a delightful prospect not only of the cataract, but of the spots where the seats of Horace and Catullus are supposed to have stood. The violence of the fall of the Teverone down the precipice turns the water entirely to foam, and has considerably excavated the rocks beneath. Tivoli has in all ages been celebrated for the great salubrity of its air, as appears from ancient authors, and it also seems to have been a favourite retreat of Horace. This city is also famous for its containing the ruins of the villas of the ancient Romans, and for its quarries of stone, which have been frequently mentioned under the name of Travertina, or Tivoli stone.

Four Italian miles from Tivoli lies the lake of Solfatara, in which are sixteen floating islands, the largest of which is not above fifty or sixty feet in circumference; so that it is not difficult to push them from the shore with a pole. The water of this lake, and the little stream of Solfatara, is impregnated with chalk and sulphur; so that the grass and other vegetables growing on its banks are speckled with white incrustations, exactly resembling, both in shape and colour, the comfits made of coriander, aniseeds, &c. hence they are called Tivoli comfits. The water of the lake and rivulet has still the reputation of curing the asthma, and all cutaneous diseases.

Piperno is a small town, seated on an eminence, fifty miles to the south-east of Rome, and contains some palaces. Its neighbourhood abounds with the cork-tree, which is an ever-green; the leaves are stiff and hard, and not unlike those of the plum or pear tree, and the fruit, which makes good mast for hogs, resembles small acorns. When the tree is stripped, it recovers its coat in about two years.

Veletri, the antient Velletræ, is a small city, pleasantly situated on a hill, twenty-two miles to the south-east of Rome, in the great road to Naples. It is the see of a bishop, and has twenty-four churches and convents. The only palace in this city belongs to prince Lancelotti, and is a magnificent structure. The great stair-case is built with white marble, and is so magnificent and well contrived, that it passes for the finest in all Italy. In the apartments are a great number of fine statues, bustos, basso relievos, and paintings. The most remarkable among the first are, a Venus with a Cupid. The prospect from the gardens is extremely beautiful, and they are ornamented with fine pieces of sculpture.

In the market-place, near the palace, is a superb bronze statue of Urban VIII. who is represented in his pontifical habit pronouncing the benediction. It was designed by Bernini, and stands on a marble pedestal.

The last place we shall mention in the Campania is Albano, the antient Alba Longa, a well-built town, much celebrated for its antiquities, and serving as a summer recess for the Roman nobility. It is one of the six bishoprics conferred on the oldest cardinals. At the distance of a mile from it stands Castello Gandolfo, the favourite residence of pope Clement XI.

Hooker & Co.

Mount Vesuvius

C H A P. XXV.

The Lower Part of ITALY, containing the Dominions of the King of the TWO SICILIES.

S E C T. I.

Of the Kingdom of NAPLES.

Its Situation, Extent, Climate, and Produce; with a particular Description of Mount Vesuvius, and of the most remarkable Animals of that Kingdom; among which is given a circumstantial Account of the Tarantula.

THE kingdom of Naples is bounded on the north-east by the Ecclesiastical State; but on all other parts by the Mediterranean and Adriatic. Its extent from the south-east to the north-west is two hundred and eighty miles, and from the north-east to the south-west from ninety-six to a hundred and twenty miles.

This country is extremely hot, which subjects foreigners, unless they take great care of themselves, to a sickly habit of body; and particularly they must forbear travelling in July, August, and September. In the lower part of the kingdom little of winter is felt, and in the plains it is very extraordinary to see ice or even snow. The snow that sometimes falls in the mountains is gathered, and kept for cooling liquors in summer instead of ice. Even so early as April, the heat of the sun is very great; but the nights are cold.

The fertility of the soil is very extraordinary, it producing an exuberance of all kinds of grain, the finest fruits and culinary vegetables, which may be raised any time of the year. Their oil, wines, rice, and flax, are equal to the finest of other countries.

Calabria affords great quantities of manna, and both there and in other parts of the kingdom saffron grows, and is esteemed as good as that brought from the East. Here are also allum, vitriol, sulphur, rock-crystal, quarries of marble, and a variety of minerals. The Neapolitan horses are much esteemed. The wool of the sheep is fine and good, and great quantities of silk are exported.

Of the filaments, or a kind of hair or wool, of an olive green, growing on some shell-fish, are made waistcoats, caps, stockings, and gloves, much warmer than wool; and though not so fine and soft as silk, yet always retain a peculiar gloss. These shell-fish are also to be met with at Malta, Sardinia, Corsica, and in the gulph of Venice. Among the natural curiosities of this country the Phrygian stone may be classed. It has neither the hardness of stone, nor the properties of earth, but consists of an indurated mixture of earth, rotten beech wood, and fibres of several plants. From this stone, laid in a shady and damp place, grow in a few days, according to its bigness, mushrooms, each often weighing twenty pounds. The seed lies in the substance of the stone, and is distinguishable only by a good microscope. The growth of the mushrooms is greatly forwarded by pouring warm water on the stone. Some other natural singularities will be taken notice of in the description of the several parts of this kingdom.

The Appennine mountains extend the whole length of the country, and terminate at the Straights of Sicily. Mount Vesuvius, so famous for its fiery eruptions, lies five Italian miles from the city of Naples, but separate from the Appennine mountains.

The declivity towards the sea is every where planted with vines and fruit-trees, and is equally fertile towards the bottom. The circumjacent plain affords a delightful prospect, and the air is clear and wholesome. The wine produced on this side and the lower part is of three sorts, all very delicious. Two of them, which seem most in request, are the *Vino Greco*, a yellow muscadine, and a red wine impiously called *lachrymæ Christi*, or the tears of Christ. Of the latter, the little that is produced is re-

served for the cellars of the king, who makes presents of it, though indeed a great deal of wine is disposed of as the genuine *lachrymæ*.

The south and west sides of the mountain form a very different view, being, like the top, covered with black cinders and stones. Mount Vesuvius, or Vesuvio, as it is called by the Neapolitans, like Parnassus, consists properly of two summits, though at present only that on the right hand as you come from Naples emits fire and smoke. The valley between these hills is about a mile long, and extremely fertile. The height of the burning summit is computed to be eleven hundred fathoms above the surface of the sea. From Resina, a village within three miles of the city of Naples, the acclivity of the mountain increases; yet one may still ride on horseback. Here are several large stones half calcined, scattered in different places, and left as memorials of former devastations; the greatest part being used by the peasants living on the mountains for inclosing their vineyards. It is astonishing to think of the impetuosity by which huge masses of four or five hundred weight have been thrown to the distance of several Italian miles.

At last the steepness of the ascent, especially as it is all over covered with ashes and cinders, will not admit of riding, when the horses are left to be taken care of by the servants, and it is adviseable for the traveller here to change his boots for shoes. Hereabouts, says Mr. Keysser, (one of the latest authors who has given an account of this mountain, which he ascended in 1730) a hermit has built a mean dwelling; and such is his fortitude, that Vesuvius must rage with uncommon vehemence before he removes his quarters. As travellers are apt to be fatigued with climbing up this uncommon ascent, he stands ready with some wine to refresh them at their return; and as the rules of his order do not prohibit his touching money, he thankfully receives any little acknowledgment made for his seasonable civility.

At this hermitage the attendance of the peasants, who follow travellers from the neighbouring villages, become necessary; but as they are apt to quarrel with one another, and are even trained to rob and murder, a traveller should always carry fire-arms with him. All they do is to go before with leathern belts round their waists, by which travellers hold, that they may climb with the greater ease; and if the two peasants that go before every traveller are not sufficient, others help by shoving him behind. These men, who are at best very troublesome by their exactions and their numbers, stile themselves *Ciceroni*, the proper title of learned antiquarian, who shew and explain to foreigners the antiquities and curiosities of the country.

The ashes giving way causes a man to slide several steps downwards; and in places free from the ashes, the ruggedness of the melted matter puts you to no less trouble: for from this volcano too often issues a lava or mixed floods of melted sulphur and metallic ore, to the inexpressible damage of the neighbouring country. The scoria of this ejected matter still lies stratum upon stratum, with large stones projecting from them, which, in their course along the sulphureous stream, were stopped by their inequalities, and fixed as the melted matter gradually hardened. By chemical experiments it appears, that the stones ejected by Vesuvius contain sulphur, vitriol, allum, antimony, marcasite, arsenic, and iron; small quantities of gold, silver, copper, tin, lead, and other minerals, have also been extracted from them, whence the difference to be found in the colour and substance of the scorix are not at all surprising.

“Near the summit of the mountain, says Mr. Keysser, “we met with stones at least of a hundred weight
“glowing

“ glowing hot, and, when broken, exactly resembling
 “ red hot iron; and, if our guides may be relied on,
 “ they had been but just ejected from the abyfs. As
 “ we still advanced, our ears were frequently assailed
 “ with a horrid noise, like that of the explosion of a whole
 “ battery of cannon; and under our feet we had a con-
 “ tinual noise, not unlike the boiling of a large cauldron.
 “ Upon making a hole with a stick in the ashes but a
 “ few inches deep, a heat was immediately felt, which
 “ in some places was hotter than our hands could bear, and
 “ we perceived the smoke to issue out, as it were, in
 “ several places through small fissures.

“ At length, after many weary steps, we came to the
 “ place where formerly the largest mouth of the moun-
 “ tain was; but this has undergone such changes, by
 “ the frequent eruptions, that at present it is not only
 “ choaked up, but covered by a round hill of ashes and
 “ cinders. In Addison's and Milson's time there was a
 “ plain of near three hundred paces to cross before they
 “ came to the skirts of this round hill, or new mountain;
 “ but such great eruptions have so enlarged the circum-
 “ ference of the hill, that here is in most places no
 “ more than a kind of trench seven or eight feet deep,
 “ and about thirty paces wide. The lower, or old
 “ mountain, is of such a height, that at the foot of it
 “ the trench is not perceived from the bottom. Here
 “ we felt a very sensible increase of heat; and especially
 “ at every explosion of the mountain, which made the
 “ ashes fly against our faces, so that some of the company
 “ were obliged to cover their eyes. The ground also
 “ was almost insupportably hot under our feet; for the
 “ embers, or slag, burnt the very soles of our shoes.
 “ Here indeed we were not terrified with the horrid
 “ noises we had heard below; but every discharge was at-
 “ tended with a whizzing like that of a great number
 “ of rockets flying up at once; the multitude of stones
 “ and other matter ejected, together with the clouds of
 “ smoak with which the sky is totally obscured, resembling
 “ the springing of a mine. Most of the stones, espe-
 “ cially the largest, returned perpendicularly into the abyfs
 “ from whence they were thrown up. Great quanti-
 “ ties, however, fall on the sides of the hill, and the noise
 “ they make in rolling down is indeed somewhat terri-
 “ ble. As the wind generally drives the ashes, smoke,
 “ &c. one way, it gives the spectator an opportunity of
 “ choosing the most favourable station; yet if the erup-
 “ tions happen to be violent, there is danger of approach-
 “ ing on any side. It being a bright day, we could
 “ perceive no flame at the mouth of the hill; and the
 “ great increase of the heat felt at every discharge, might
 “ proceed from the melted matter and ignited stones
 “ thrown into the air, which in the night appear like
 “ red-hot bullets: but the phenomena exhibited by
 “ volcanos are not constantly alike.

“ We had still about eight hundred paces to ascend
 “ among hot stones and ashes; but the eruptions fol-
 “ lowed so thick upon one another, that before we could
 “ have reached the summit, we must have stood at least
 “ eight shocks more; and as the danger every minute
 “ became manifestly greater, and our faint-hearted guides
 “ grew excessively out of humour, we all agreed to re-
 “ turn.”

Mr. Addison ascended to the top when there were no
 eruptions, and thus describes the inward cavity, as it then
 appeared. Having, with much difficulty, conquered the
 last hill, he and his companions saw in the midst of it
 the mouth of Vesuvius, which went shelving down on
 all sides, till it reached above a hundred yards deep;
 the mouth itself seeming perfectly round, and about three
 or four hundred yards in diameter. This vast hollow
 was generally filled with smoke, but having the advan-
 tage of the wind, they had a very distinct sight of it.
 The sides seemed all over stained with mixtures of red,
 green, yellow, and white, with several rocks projecting
 out of them, like pure brimstone. The bottom was en-
 tirely covered, and, though they looked very narrowly,
 they could see nothing like a hole in it, the smoak in
 many places breaking through several imperceptible
 cracks. In the late eruptions, this gentleman informs us,
 this vast hollow was like a prodigious cauldron filled with
 melted and glowing matter, which, on its boiling over

in any part, ran down the sides of the mountain, forming
 five rivers of liquid fire; and adds, as the heat slackened,
 this matter must have subsided within the bowels of the
 mountain, and sinking very leisurely, had time to cake
 together, and form the bottom which covers the mouth
 of that dreadful vault that lies underneath it. The whole
 mountain, shaped like a sugar-loaf, has been formed at
 several times with a prodigious quantity of earth and cin-
 ders, that have been thrown up out of the mouth that
 lies in the middle of it, and increases in bulk at every
 eruption, the ashes falling down its sides like the sand
 in an hour-glass; so that in length of time it will cover the
 whole plain, and make one mountain with that on the
 top of which it is placed.

Though mount Vesuvius, says Mr. Keyser, often fills
 the neighbouring country with terror, yet as few things
 in nature are so absolutely noxious as not to produce
 some good; even this raging volcano, by its sulphureous
 and nitrous manure, and the heat of its subterraneous
 fires, contributes not a little to the uncommon fertility of
 the country about it, and the profusion of fruit, herb-
 age, &c. with which it is every where covered. Those
 are observed to be the most fertile spots which abound in
 sulphur, salt-petre, &c. and if such igneous and inflam-
 mable substances were pent up, their fermentation and
 ebullition would be productive of the most calamitous
 effects; whereas they find a vent through these volcanos.
 Experience shews, that earthquakes, after any continued
 eruptions of Vesuvius, are neither so frequent, nor pro-
 duce such fatal effects, as at other times. Hence the in-
 habitants are far from being alarmed at this mountain's
 vernal eruptions, when they are not violent; and the air
 is so far from being rendered unhealthful by them, that
 Barra, a village at the foot of Vesuvius, near the sea, is
 remarkable for its healthfulness.

In the sea near the foot of the mountain, is sometimes
 found petroleum, a very fragrant oil, which is sold at a
 very high price, and makes a rich perfume. During the
 time that it rises, the surface of the sea is for a little space
 covered with its bubbles, which they skim off into their
 boats, and afterwards set a separating in pots and jars;
 but its sources are said never to run but when the wea-
 ther is warm and calm. Perhaps they may be hindered
 from discovering them by the agitations of the water.

Notwithstanding the advantages arising from these
 vents given to the inflammable matter contained in the
 bowels of the earth, earthquakes have been of no small
 detriment to this kingdom, and are chiefly felt in the
 lower parts, where are seen the ruins of many celebrated
 cities, of which now scarce the name is preserved.

Another inconvenience, but common to all Italy, is the
 swarms of lizards, especially of the green kind. In spring
 hundreds of these little animals are seen basking on the
 flat roofs, and as they crawl up and down the walls, if a
 window or door be left open, they make their way into
 the houses. The green lizards, which are very nimble,
 have very beautiful eyes, a fine glossy skin, and are quite
 harmless. About Fondi, Capua, and Gaeta, there is a
 noxious species of lizards, improperly called Tarantula,
 whose bite is attended with danger: these are brown,
 larger than the green sort, and, when the tail is cut off,
 resemble a toad.

The scorpion, which is a much greater nuisance, not
 only harbours in old buildings, and under large stones,
 but infests the houses in this country; so that it is not
 unusual in some places to make the bedsteads of polished
 iron, and to place them at some distance from the walls,
 to prevent their getting into the beds. It is true, they
 seldom hurt, unless they are first assailed, or accidentally
 injured, which may be easily done by a man's turning
 himself, or moving a leg or an arm in a bed where these
 noxious animals harbour. The surest remedy against the
 sting of a scorpion is to bruise that animal, and bind it
 fast on the wound. In the northern parts of Italy this
 creature has little or nothing of that rage and venom
 which appear in those of hotter climates. Scorpions
 yield a salt and oil, which are a part of the materia me-
 dica. They are caught in great numbers among ruins,
 or in stoney places, and being taken hold of with a pair
 of pincers, are dropped in narrow-necked glass vessels,
 which are too slippery for them to climb out.

Another

Another plague almost peculiar to the kingdom of Naples, especially the southern parts, is the tarantula, a kind of spider, so called from the city of Tarento, in the neighbourhood of which they abound, and are the largest and most venomous. The persons bit by this insect are called by the Italians Tarantolati. Few of such unhappy persons can bear the sight of black or blue; but seem delighted with red and green objects. They are also seized with an aversion to eating fruit or vegetables. A melancholy silence and a fixed eye are the first symptoms by which the bite of the tarantula discovers itself, and then music is immediately called in to rouse the patient to a violent motion, and by that means to promote perspiration, and a copious sweat. But neither the same tunes nor the same instruments answer this end with regard to different patients; several trials are therefore made, and chiefly with the guitar, hautboy, trumpet, violin, and Sicilian kettle-drum.

In some parts of the kingdom of Naples, particularly in Apulia, the venom of the scorpions is so subtle, that their sting produces the like effects as the bite of the tarantula; and though the same tunes have a proper effect on these patients also, yet they require softer instruments, as the flute, &c. accompanied by a brisk beat of the drum. The country people, who are more or less skilled in all these instruments, enforce the operation of their music with grimaces and odd gesticulations. The Tarantolati, on their side, vigorously exert themselves, regulating their motions according to the music, till the venom is quite expelled; this exercise and cure sometimes takes up five or six days; not that they are kept continually dancing all that time, but when nature seems to be exhausted, the music is suspended, and the patient put to bed well covered, and a sudorific cordial given him to promote perspiration. It is remarkable that the patient on his recovery remembers nothing of what passed during his disorder, and that if the cure be not perfectly effected, and the poison entirely expelled, the same symptoms return the succeeding year, especially during the summer heats; and some have laboured under this terrible disorder, at intervals, for ten, twenty, or thirty years.

The bite of a tarantula at first occasions only a small red tumour, like that occasioned by the sting of a wasp, and there are above eight species of them differing in size, colour, and form, but producing the same mischievous effects by their venom. The tarantula is most dangerous in the dog days, and during the violent heats, especially on the plains, as if they were incited to greater rage by the sun: for those of Tuscany never occasion such deplorable disorders as the malignant kind found in Apulia; and even in these, when carried to the northern parts of the kingdom of Naples, or to Rome, the venom is rendered less noxious, so that their bite is attended only with a slight transitory pain.

The tarantula's chief haunts are holes in the earth, old walls, and hollow trees, and the cobweb it makes is stronger and coarser than that of a common spider. The poison is contained in two small vesicles within the gums, near two fangs, with which they are armed, besides lesser teeth.

S E C T. II.

The Manners and Customs of the Neapolitans; their public Entertainments; the State of Religion; with an Account of the Procession of the penitent Prostitutes. The Form of Government and History of the Country. Its Army; an Account of the Order of St. Januarius, and its Forces.

IT has been said by some authors, that the worst creatures in this delightful country are the inhabitants themselves, who, besides their unnatural lusts, are of a vindictive, treacherous, and bloody disposition. National reflections, indeed, generally imply ignorance, narrowness of soul, and want of charity; but it must be confessed that the history of Naples abounds in instances which disgrace human nature. Mr. Keysser observes, that when he was there, Tophana, the noted female poisoner, who first invented the *aqua Tophania*, was still living in prison, and that few foreigners left Naples

without seeing that infernal monster. She is a little old woman, says he, who had entered into a kind of religious sisterhood, and on this account, if not a worse, her life has hitherto been spared. She is said to have poisoned some hundreds of people, and was remarkably liberal of her drops, which she gave by way of alms to wives, who, from several intimations, she knew would not be inconsolable for the death of their husbands. Five or six drops of this liquid, it seems, answer the horrid purpose, and may be lowered or tempered so as to take effect in any determinate time. This water even still continues to be privately made at Naples.

The inhabitants of this kingdom have always been remarkable for their voluptuousness, and in no city in Europe are prostitutes so numerous or so abandoned: these are said to amount to eighteen thousand in the city of Naples, and in one particular part of it, is a receptacle for two thousand of them; and yet it is no uncommon thing for even ecclesiastics to lodge in those infamous parts of the town. This has an unhappy effect, and the clergy being exempt from the civil jurisdiction, and connived at by their superiors, set the worst examples; and any complaints against them from laymen are considered as the height of insolence.

Great numbers of the peasants are so slothful, as to prefer begging and robbing to labour and industry; but in the city of Naples there are several flourishing manufactures, and something of a spirit of industry.

Among their public entertainments one of the most extraordinary is the procession with four triumphal cars, on the four Sundays immediately preceding Lent; the first with bread, the second with flesh, the third with vegetables, and the fourth with fish. These provisions are piled up very high, with musicians placed at the top, and guarded by armed men, till they are given up to be pillaged by the populace. But that which draws the greatest concourse to Naples is the castle built according to the rules of fortification, and faced all over with pieces of beef, bacon, hams, geese, turkeys, and other provisions. This welcome spectacle is exhibited once a year, and on each side of the castle is a fountain running with wine during the whole day. A party of soldiers is posted to restrain the ardour of the populace till the viceroy appears in his balcony, which is the signal for the assault.

It is usual for the Neapolitan nobility to spend some years in a parsimonious retirement on their estates in the country, that they may cut a figure for a while in the city, by living in profuse magnificence; thus they are generally running into extremes: their fortunes, however, are not very considerable, which is a natural consequence of there being a great disproportion in their number to the small extent of the country; for there are in this kingdom a hundred and nineteen princes, a hundred and fifty-six dukes, a hundred and seventy-three marquises, forty-two counts, and four hundred and forty-five barons, all vassals of the crown; and as many spots of land that are not worth above fifty dollars a year, give the owners the title of marquis, they are consequently very poor.

Religion, as we have already hinted, is on a very bad footing; and the best that can be said of the ecclesiastical constitution is, that the Neapolitans have always resolutely opposed the introducing of the inquisition. The number of monasteries and convents is astonishing, and the clergy are as remarkable for their wealth as the laity for their poverty. Such is the power and opulence to which the clergy have arrived, that they have more than once been ready to seize the civil power, and to arrogate to themselves a decisive authority in matters quite foreign to their pastoral care, nor can they bear the least controul or censure on this account. Some who are well acquainted with the state of the kingdom affirm, that the clergy are possessed of near two-thirds of its whole produce, without the people's having any hopes of recovering the least part, all alienations being prohibited by express laws. The laity have often, in the strongest manner, petitioned their sovereigns, that the clergy might be no longer allowed to purchase lands and houses; but all endeavours were fruitless, till at length, in 1751, measures were concerted, with the pope's consent, for lessening the number of convents.

The devotion of the Roman catholics is not here, however, so outrageous as in several parts of Germany. At the elevation of the host in the churches, or when it is carried along the streets, no traveller is compelled to kneel; and so little difficulty is made about strangers eating fish and fowls in Lent, that the inn-keepers readily provide for them whatever they please. Since the government came into the hands of the Austrian line of the house of Hapsburg, the statue of St. Nepomuk has been erected on several bridges; but crosses are not very numerous in the streets; nor public processions, even in the capital itself, so frequent as in most other popish cities.

The most common procession, which is exhibited almost every day, is less intended to excite devotion than to raise a fund for penitent prostitutes, who have quitted their abandoned way of life for a convent. In order the more effectually to move the spectators to charity, the youngest and most beautiful of these penitents are selected, who walk bare-footed through the city two abreast: at particular places they kneel down, acknowledge their past wickedness, and sing penitential hymns, while an ecclesiastic and a lay-assistant receive the contributions of the people in a purse fastened to the end of a stick. Their habit on these occasions is a violet coloured gown, tied round the waist with a cord of the same colour. Their heads are shaved, and they wear a blue veil; but it is so thin as to afford a sight of the charms of youth and beauty, which are found to be powerful incentives to a liberal contribution.

The Neapolitans are far from being deficient in their intellects; but, notwithstanding all their schools, universities, and academies, their religion is a perpetual bar to the improvement and increase of solid literature.

The silk, woollen, and other manufactures, together with the improvement of the arts, owe their first establishment to Ferdinand of Arragon, who patronized them in a very liberal manner. These manufactures, joined to the produce of the country, are the source of their trade.

In this kingdom are only two states, consisting of nobles and commons, the clergy not making a distinct class, but being intermingled with the other two: but in the city of Naples there are several noble and illustrious families which make no part of either of the two states, but are in some sense considered as foreigners. The general assembly of the states is summoned every two years to meet at the capital, where the sessions are held in the Minorite convent near St. Laurence's church, where their chief business is to deliberate on the customary free gift to the king, which has often amounted to upwards of one million five hundred thousand crowns.

The provinces of which the kingdom of Naples consists were formerly a part of the dominions of the Roman republic, and afterwards of the emperors. In the fifth century they were over-run by the Visigoths, Ostrogoths, and Herulians. Belisarius, the general of Justinian, emperor of the East, took Sicily and the provinces of the present kingdom of Naples; but these provinces were soon again dismembered, one part still remaining under the Grecian emperors, and the Longobardi seizing on the other. At last the Saracens took Sicily, and frequently committed great ravages in Italy. After several revolutions it was conquered by the Normans, Constantia, the wife of the emperor Henry VI. the last of the legitimate descendants of Roger, the first king of the Norman race, dying in 1198, the succession devolved on her son Frederic II. emperor of Germany; and thus the kingdom fell to the house of Swabia. On the death of his son Conrad IV. his natural son, Manfred, having made himself master of the kingdom, pope Urban IV. and afterwards Clement IV. being strenuously bent on the expulsion of the house of Swabia, offered the kingdoms of Naples and Sicily to Charles of Anjou; and, to give the greater sanction to the enterprize, crowned him king. Manfred lost his life in an unsuccessful battle, and Charles's severity so alienated his subjects, that Conradine of Swabia, the son of Conrad IV. the only lawful heir to the kingdom, was invited to assert his claim to the hereditary dominions of his father; but this young prince being so unfortunate as to be taken pri-

soner, was beheaded; and thus Charles was secured on the throne. In 1277 this prince became king of Jerusalem, but lost Sicily; for the inhabitants, exasperated by the insolence and tyranny of the French, having a nobleman called John de Procida at their head, on Easter-day, 1312, when the bells chimed for vespers, rose and massacred all the Frenchmen in the island. Upon which Peter of Arragon was chosen king, and his descendants reigned over Sicily till the beginning of the fifteenth century, when it was again united to Naples. At length Ferdinand the Catholic, king of Spain, and Lewis XII. king of France, seized the kingdom; but Ferdinand maintaining that the entire kingdom belonged to himself, and making good his claim by force of arms, Naples continued to be governed by Spanish viceroys till the beginning of the present century. During the long and bloody war for the succession, count Daun, in 1707, conquered this kingdom for Charles III. afterwards emperor, by the title of Charles VI. who in 1720 also acquired Sicily. In 1734 the Spaniards made themselves masters of both kingdoms for the infant Don Carlos; and in 1736 the emperor, by a formal instrument, ceded the kingdoms of Naples and Sicily to him and his heirs, and in default of issue to his younger brothers and sisters; but Don Carlos, on the death of his father, being placed on the throne of Spain, was succeeded by Ferdinand IV. his third son.

The arms of the kingdom of Naples are a field azure, interspersed with lilies or, with a tournament collar of five lapets gules.

There is here an order of knighthood, which is that of St. Januarius, instituted by Don Carlos, in the year 1738. Its badge is the image of this saint, appendant to a watered carnation ribbon, passing from the right shoulder to the left side, and on the left breast of the coat a silver cross. The principal offices under the government are the council of state, to which belong the secretaries of state, the king's privy-council, the treasury, the Sicily council, the treasury of Palermo, the council of war, &c.

The standing forces throughout the kingdom do not exceed thirty thousand men, of which the Swiss regiments are the best.

The kingdom of Naples is divided into twelve provinces: these are Terra di Lavoro, the Hither Principality, the Farther Principality, the Basilicate, Hither Calabria, Farther Calabria, and Apulia, under which last are included the territories of Otranto, Barri, the Capitinata, the Molise, and the provinces of Hither and Farther Abruzzo.

SECT. III.

Of the Province of Naples called Terra di Lavoro, or the Territory of Lavoro; its Situation, Extent, and Rivers; with a particular Description of the City of Naples.

TERRA di Lavoro, in Latin Terra Laboris, is esteemed the principal district in this kingdom, on account of the number of its towns, the richness of its soil, and its containing the capital of the kingdom. It comprehends a part of the antient Campania Felix, and was so called on account of its amazing fertility, and in the middle ages the Castellany of Capua; but received its present appellation in 1091 from Richard II. prince of Capua, and the Normans, who in the beginning of the same year were driven by the Longobardian inhabitants out of the city of Capua, and instead of the principality of Capua used to term it Terra di Lavoro, from the fitness of the soil for all manner of culture. Its coast extends along the Mediterranean about a hundred and twenty miles, including the windings and creeks, and it is about thirty-three in breadth, where broadest; but its greatest length, from the Ecclesiastical State to the Hither Principality in a direct line, does not exceed seventy-four miles. It is bounded on the north by the Hither and Farther Abruzzo, on the east by the county of Molise and the Farther Principality, on the south by the Hither Principality and the gulph of Naples, and on the west by the Campania of Rome.

Procession of the Penitent Prostitutes at Naples.

The chief rivers which water this fine territory are the Carigliano, the antient Liris, the Saone, or Novigliano, the Voltorno, which receives the Sabato Calvi, and some others; the Clanio, or Patria, and the Sarno, or Scafati. The principal lakes are the Mare Morto, or Dead Sea, which is rather a gulph, the Averno, and the Collucia, the antient Acherusius.

The city of Naples, in Italian Napoli, the antient Parthenope, afterwards Neapolis, the capital of the kingdom, is seated in the forty-first degree twenty one minutes north latitude, and in the fourteenth degree forty-five minutes east longitude, standing partly on a mountain, and partly towards the sea. Its walls, which are mostly faced with a hard black stone called piperno, are nine miles in circuit; but including the suburbs, the entire circumference cannot be less than eighteen or twenty Italian miles. Most of the streets are admirably well paved with free stone; but the fault is, they have no slope or gutters to carry off water. That of the greatest length and breadth is called the Strada di Toledo, which is about twenty-three common paces broad; and, after running in a direct line fifteen hundred paces, it is continued some hundreds more in an easy curve. This street indeed has not one eminent palace; but though Naples has not such magnificent structures as are to be seen at Rome and Genoa, it has very few of those mean buildings which in other cities disgrace their finest streets. The houses in general are lofty and of stone, with paved flat roofs, surrounded with elegant balustrades: but the great number of stalls on which eatables are exposed to sale, and of balconies with lattice windows, are a great impediment to the streets appearing to advantage; besides, they are left destitute of the convenience and ornament of being illuminated at night, and few cities are more dangerous after it is dark.

The harbour is very spacious, and has a grand light-house, with a mole near five hundred paces in length, which separates the main harbour from the basin. The latter lies behind the Castello Nuovo, and has generally in it four galleys, the crews of which, both rowers and soldiers, are obliged every Lent to come to a formal confession, and to receive the sacrament. The devotions of the first galley are followed by a day of rest, the second by a like interval, and so on. In the evening, at the close of the procession usual on such solemnities, the host is exposed, and all the galleys give it a salute.

The great number of fountains are very elegant ornaments of the city, though in many of them the water is but indifferent. The finest of these fountains is that of Medina facing Castello Nuovo, or the New Castle: the upper basin is supported by the three Graces, and on the top stands a superb Neptune, attended by several other figures, all ejecting water, which make a very grand appearance. Several of the other fountains are of elegant architecture, adorned with good pieces of sculpture. A very fine aqueduct supplies the city with a vast quantity of water from the foot of Mount Vesuvius, by means of which Alphonsus II. in 1442 made himself master of the city. The place where formerly was the greatest reservoir of these waters is at present known by the name of Seggio di Nido, or Nilo, where there is an antique statue of the river Nile, represented under the figure of an old man sitting on a crocodile, with boys playing about him.

The number of the inhabitants is at least three hundred thousand, and as the commerce of the city occasions a great bustle, Rome, in comparison of this city, has by some travellers been looked upon as a kind of desert. Here are swarms of princes, dukes, marquises, and other nobility, to whom are appointed five large squares, called Capuana, Nido, Montagna, Porto, and Porta Nuovo. The commonalty have also their peculiar district. Each of these six districts chooses its deputies, who superintend the police of the city, and hold a court for the examination of such public concerns as fall under their cognizance. The nobility of the five piazzas, as they are called, also name their syndics, who, in the parliaments and other solemn assemblies, represent the city, and the whole kingdom.

Of all the palaces that of the king is the most august, and of the newest architecture. It was the work of the

famous Fontana. The great *perron*, which is divided into two flights of steps, is of white marble, eleven common paces in breadth, and has a magnificent appearance. At the foot of the steps on each side is the statue of a river, that on the right representing the Ebro, and that on the left the Tagus: but the eye of a connoisseur, on entering the palace on this side, must be offended at the disproportionate narrowness of the court. In the audience-room are finely painted the most remarkable actions of the Spanish nation, among which is placed the expulsion of the Jews out of Spain. The Sala Regia, where the carnival entertainments are held, is hung with the pictures of all the viceroys at full length, and a particular gallery is taken up with the exploits of the duke of Alva. In another saloon is represented the war carried on by Charles V. with John Frederic, elector of Saxony. Indeed all the apartments abound in fine paintings and beautiful tapestry. In the palace chapel are surprising quantities of plate, and behind the altar stands a most admirable white marble statue of the Virgin Mary.

The monasteries and convents of both sexes in this city are computed at a hundred and forty-nine; besides which are thirty-four houses for poor boys, girls, and women; eleven hospitals, five seminaries for ecclesiastics, four capital churches, thirty-two parish-churches, seventy other churches and chapels, and upwards of a hundred and thirty oratories or chapels of religious fraternities. Most of the churches are deficient in good paintings and a fine front, and their marble monuments are not of those magnificent large dimensions that strike the eye with such surprize, as the far greater part do in Rome; but every thing else, in beauty and richness, surpasses all of the kind in other Catholic countries, the value of the jewels and utensils of the altars being alone estimated at several millions of dollars.

For the defence of the city, and at the same time to keep it in subjection, are five castles, which, according to the old method, consist chiefly of very strong walls. The Castello Nuovo has a communication by a covert-way with the king's palace, and one side is contiguous to the sea. Its subterraneous works and mines are admirable. At its entrance stands a triumphal arch of very curious sculpture. Near it is a brass gate, decorated with fine basso relievos, representing some of the achievements of the kings of Arragon. The castle church is handsomely decorated with gilding and stucco-work, and a Pieta, in a room adjoining to it, is greatly admired. Facing the armoury, which it is said can compleatly furnish fifty thousand men, stands a marble antique statue of a young soldier, or, according to some, of the emperor Nero.

The Castello del Uovo, or Egg Castle, so called from its oval form, stands on a rock in the sea, which is joined to the continent by a bridge two hundred and twenty paces in length: it is supplied with fresh water by means of a stone conduit, embellished with a variety of marble figures of animals, and conveys the water from the city under the bridge to the castle, where are two reservoirs.

The third check upon the city of Naples is the castle of St. Elmo, or St. Eramo, thus called from a church dedicated to that saint, which formerly stood on this spot. It is situated on an eminence towards the west, and is in the form of a star with six rays. The subterraneous works are very spacious, and hewn out of the rock to such a depth as to be bomb-proof, on which account a great quantity of military stores are kept here. This castle may be supplied with provisions from Castello Nuovo, by means of a subterraneous communication. In the upper part of St. Elmo's castle are seven cisterns for water, and under the vaults and mines is a reservoir large enough for two galleys to sail on. The water, which is always extremely cold, is drawn up by buckets. The two other castles are of little note.

The most remarkable houses at Naples are those of the prince di St. Agata, the dukes of Gravina and Mataloni, and a few others.

The most remarkable churches and convents in this city are the following:

The cathedral is dedicated to the Assumption of the Virgin Mary, and, though a Gothic structure, is very fine. On the high altar is the Assumption of the Virgin Mary,

Mary, by Pietro Perugino, a painter, who was Raphael's master. Fronting the altar are two pillars of red jasper, twelve feet high, without the pedestals, which are of verde antico. In the chapel under the high altar are some curious works in marble, as festoons, foliages, birds, children, and angels, which are by some attributed to Michael Angelo, who also cut the transparent alabaster statue of cardinal Oliverio Caraffa, the founder of this chapel, placed behind the altar. The pavement is inlaid with verde-antico, jasper, giallo-antico, and porphyry. The remains of St. Januarius have been removed from the church dedicated to that saint, without the walls, to this subterraneous chapel. The late emperor offered at his shrine twelve silver eagles, in the heads of which are twelve lamps kept continually burning, and one hundred scudi a year are appointed for supplying them with oil.

The most remarkable chapel in this cathedral is that called il Tesoro, on the right hand on entering the church, the architecture of which is extremely beautiful. In it are the statues of St. Peter and St. Paul finely executed by Finelli, and two pillars of black marble most beautifully spotted; the door is of brass curiously wrought with festoons and foliages. The chapel is of a round figure, and contains seven altars of the finest marble, and forty-two pillars of broccatello. Twenty-one large bronze images of saints, each valued at four thousand scudi, stand round the upper part of the wall, and under them are sixty silver busts of so many saints. The cupola was painted by Lanfranco, Domenichino, and Perme-giano; but their work has suffered much by earthquakes that have damaged the cupola. Behind the high altar, which is detached from the wall, and entirely of red porphyry, is the shrine with silver doors, where they pretend to keep St. Januarius's head, with some of his blood, contained in two crystal phials, and said to have been gathered by a woman at the time of his martyrdom. Besides the three stated times in the year for exposing these relics to the public view, the like is done with the deepest humiliations on account of famine, pestilence, earthquakes, or any other public calamity, which is supposed to require the interposition of this saint. The pretended liquefaction of the coagulated blood in the phials, when placed near the head, is known to all the world. This farce is acted the first Sunday in May, and on the success or failure of this miracle the prosperity or calamity of the succeeding year is supposed to depend. As the former occasions great public rejoicings, so if the blood remains coagulated, recourse is had to processions, public flagellations, &c. to avert the impending danger.

That accurate naturalist and philosopher Mr. Key-
fler observes, that the substance in the phial is of a brownish red, and looks like balsam of Peru, which may be very easily liquefied. On the day when this miracle is to be exhibited, the phial containing the supposed blood stands surrounded by a great number of lights: it is about three inches long, and is applied to the mouths and foreheads of an innumerable multitude of people who throng to partake of such a blessing, the priest all the while turning it every way; so that by the continual agitation, the warmth of his hand, the heat from the lights, the effluvia from such crowds, the sultriness of the weather, &c. it is not unreasonable to suppose a condensed fluid may be gradually restored to its liquidity. At length the priest cries out, *Il miracolo è fatto*, "The miracle is performed," which is immediately answered by a *Te Deum*, amidst the acclamations of the people, and the discharge of cannon. This pretended miracle is not however peculiar to the blood of St. Januarius, for that of St. John the Baptist, St. Stephen, St. Pantaleon, St. Vitus, and St. Patricia, exhibit the like spectacle in other churches at Naples, where such relics are kept, and generally on the days dedicated to those saints.

In the area before the cathedral stands a fine marble obelisk, on which is erected a brass statue of St. Januarius, with a Latin inscription to the following purpose: "Erected by the city of Naples, out of gratitude to St. Januarius, the ever propitious and powerful protector of his native city and the whole kingdom." This obelisk is annually illuminated on the nineteenth of September, with a splendor hardly to be conceived, while a

numerous band of music play by it, and all the guns in the several forts are fired on the occasion.

The church of the Holy Apostles is almost covered with gilding and painting; but it wants a beautiful front. Over the entrance is a piece of painting by Lanfranco, representing the angel descending to stir the waters of Bethesda, and he also painted the roof. The cupola is likewise finely painted, and the tabernacle on the great altar is a most admirable piece, consisting of eight pillars, and other decorations of amethysts, emeralds, lapis-lazuli, agates of several colours, a topaz of the size of a walnut, and other gems. On the altar piece is a fine painting of Christ's head, with a crown of thorns. The altar is of flowered marble, and the balustrade before it of red and white marble. The other chapels of this church are also exceeding beautiful.

In the convent belonging to this church are three galleries, one over another; but that on the ground-floor is by much the finest. The stair-case runs in a spiral line, and the steps are very low, for the convenience of asses carrying up corn to the granaries. The library is elegant, well furnished with books, and affords a delightful prospect.

Near this convent is held a weekly meeting of the heads of a society consisting of two hundred gentlemen of the law, to examine the private grievances of the poor; and in case any pauper is found to be oppressed, and can make good his complaint, a member of this society is nominated to undertake his cause: but neither this member nor the society are at any expence, the law charges being defrayed by the Theatine convent, which has large endowments for that particular purpose.

The Jesuits college, as usual, is one of the finest structures in the city: the refectory, the library, the great stair-case, the dispensatory, and the church belonging to this college, will afford entertainment to a traveller of taste. The cupola, which is admirably painted by Lanfranco, was damaged by an earthquake in 1688; so that the only remains of that eminent pencil are the Evangelists, the rest being painted by Paolo de Mattheis, a Neapolitan. The altars are extremely rich, and in the treasury, besides several statues and busts, is St. Cyr, as big as the life, of silver, enriched with emeralds. The Jesuits have also several other churches in this city.

St. Dominico Maggiore belongs to the Dominican monks, and contiguous to it is a convent, where there are generally a hundred and forty monks. This church was built by king Charles II. whose heart is kept here embalmed in a small ivory urn. In the chapel of the Holy Crucifix is the crucifix, which, it is pretended, expressed its approbation of the writings of Thomas of Aquinas on the real presence of the body and blood of Christ in the Sacrament, and on certain days this crucifix is annually exposed to public view with great pomp; but at all other times it is not to be seen. In the Capella di Stigliano is an exquisite image of the Virgin Mary, and in the chapel of St. Joseph are two fine pictures by Guido. The vestry is very lofty, and finely painted by Solimene. In the gallery are seven coffins, richly covered, in which are the remains of the kings and queens of Naples, and other great personages.

The church of St. Francisco di Paola, which faces the viceroy's palace, is remarkable for a beautiful pavement, a roof finely carved and gilt, and several marble ornaments, especially at the high altar. The tabernacle is embellished with eight incomparable pillars, two of lapis-lazuli, and the other six of green jasper. In the middle of this altar is an excellent piece of perspective in enamel, and it is profusely enriched with gems. The painting about the altar, and of the whole choir, is by Luca Giordano. Among its relics are two small phials, which they pretend are full of the Virgin Mary's milk, that resembles white terræ sigillatæ, but liquefies on the festivals of the Virgin. Among the silver ornaments in the chapel, contiguous to the dispensatory, is a statue of St. Michael near three feet high, glittering with jewels, and valued at twelve thousand ducats.

St. Maria Annunziata is one of the finest churches in Naples, for the eye every where meets with noble paintings, statues, monuments, and basso relievos.

The

The hospital called *la Casa Santa*, belonging to this church, was once the best endowed of any in the whole world, its annual income amounting, according to some, to a million of scudi, or about two hundred and fifty thousand pounds sterling. The children maintained here are generally about two thousand five hundred in number. The boys are brought up to handicraft trades, and some even to the church. The girls, as they grow up, according to their capacities, or inclinations, do the work of the hospital, are employed in the instruction of the children, entered into a convent, or married, and had formerly a portion of one or two hundred ducats. The young women married from this house, in case they are left widows in necessitous circumstances, or forsaken by their husbands; or if the marriage, without any fault of theirs, proves unfortunate, are entitled to be re-admitted, and have a particular apartment allowed them. The annual amount of the dowries to other women, with which this house is charged by several antient legacies and foundations, was at least eighteen thousand ducats; there being many noble families whose daughters at their marriage received two or three thousand dollars from this hospital. The physicians, surgeons, apothecaries, servants, &c. stood the house annually in fourteen thousand ducats.

To the *Casa Santa* belong four other hospitals, one of which is at *Puzzuolo*, and another at *Tritoli*, where great numbers of patients are sent every summer to the warm baths and sudatories, and there provided with food, lodging, and necessary attendance.

This was the state of the hospital at the beginning of the present century, when it proved bankrupt for above five million of ducats, on which account, till the debts are discharged, the revenue is assigned over to the creditors, allowing only forty-two thousand ducats a year for the support of the hospital, the church, and the convent. This has reduced the girls portions from two hundred ducats to fifty, and the other expences have suffered a proportional diminution.

In the church of *St. Maria della Sanito*, which belongs to the Dominicans, are thirteen small cupolas over so many altars, all finely ornamented with paintings. The tabernacle on the high altar has eight pillars of rock crystal, each a foot high, cut out of a single piece. It is also enriched with a great number of sapphires, and other precious stones. The pulpit is an exquisite inlaid work of marble and mother of pearl. In the vestry are shewn a crucifix and several pyramids of crystal; fourteen silver candlesticks, each above six feet high; a very small casket in the form of an altar, on one side of which is the passion of Christ, of such fine workmanship, that in the bosom of the Virgin Mary, which opens with two folding doors, the crucifixion of our Saviour is to be seen within the compass of a silver two-pence. In the casket is also kept another representation of the crucifixion, composed of emeralds and other gems. On the *Ostenforium*, where the consecrated wafer lies, the sun is finely represented, the radiancy of his beams being heightened by the blaze of diamonds, pearls, and rubies. The church and convent are built on an ascent; so that a great part of the former, and even some pillars, are hewn out of the rock. The prospect from thence towards the sea and Mount *Vesuvius* is extremely beautiful, and before the refectory is an orangery in the open air, the trees of which are of an uncommon size.

The spacious convent of *St. Martino* is every where full of curious and magnificent pieces, and the church, though none of the largest, is a very fine one. The monks boast that under one priorate above five hundred thousand ducats were bestowed among them in silver plate, sculptures, and pictures. The *Nativity of Christ* is a most exquisite piece done by *Guido*: the four pictures of the *Last Supper* are by the hands of *Espagnolet*, *Hannibal Caracci*, *Paul Veronese*, and *Massimo*; besides which, there are many other pieces of great value, and in particular the famous crucifix of *Michael Angelo*, done, as it is said, to the life, after a peasant, who for that purpose was murdered by the painter: it is of wood, and not above half a foot high. It is observable, that the head is

upright, which does not look very like the posture of an expiring person. The pavement of the cloyster, which is a hundred paces square, is of marble inlaid in boughs and such like ornaments, and the four galleries are supported by sixty pillars, each of one entire piece of the best white marble of *Carrara*. Every fryar has his own chamber, closet, library, and little garden; and the prior's lodgings are fit for the reception of a prince.

From this ascent there is the most delightful prospect that can be well conceived; for at one view may be seen the sea and many islands, and particularly that of *Caprea*, and the famous seraglio of *Tiberius*; as likewise the whole city of *Naples*; with a great number of villages situated along the sea-shore.

The university of *Naples* was founded in 1224 by the emperor *Frederic II.* and the university, or palace *Degli Studii Publici*, founded in the seventeenth century, by count *Lemos*, would, if it was finished, be the finest scholastic structure in *Italy*.

The suburb of *Chiaia*, or *Spiaggia*, lies along the sea-shore, and is one of the pleasantest parts in the city, and on that account some hundreds of coaches resort thither in an evening.

We cannot take leave of *Naples* without mentioning the catacombs, which the vulgar imagine were the work of the primitive Christians, and served as retreats in time of persecution; but this opinion is confuted by their being hewn out of the solid rock, and its being impossible to accomplish them clandestinely and without immense charges, and consequently they could never be the work of the Christians while the Pagans had the superiority. The galleries, or passages, are here loftier and wider than those of *Rome*; they are generally arched, and so broad that six persons may walk a-breast; and here is one particular vault of such a height, that the roof cannot be discerned by the light of flambeaus carried into it. The catacombs must have been extremely loathsome if, as some have imagined, the dead bodies that lay in them were left to rot in open niches; but this was not the case. They were deposited in cavities on both sides of the vaults, four or five, one over another, and these cavities were closed up with a marble slab or tile cemented with mortar. *St. Proculus's* sepulchre appears to have had a kind of Mosaic work on its covering, for at one end of it are several small pieces of marble ranged together after that manner; and it is probable they were all adorned, according to the quality of the dead. It is indeed surprizing to find such a multitude of niches unstopped; but they were probably opened by those who were in quest of some supposed treasure.

It is proper to mention among the curiosities of *Naples*, the manner of furnishing that city with snow, which they there use instead of ice, because they suppose it sooner cools any liquor. There is a great quantity of it annually consumed; for they drink very few liquors, and not even water without it: thus it is used by every body from the highest to the lowest, so that a scarcity of snow would occasion a mutiny, as much as a dearth of corn in any other country. To prevent this the king of *Spain* sold the monopoly of it to certain persons, who are obliged to furnish the city with it all the year round at so much the pound. For this purpose they make use of an high mountain at about eighteen miles distance, in which they have several pits. There they employ many poor people at the proper season of the year to roll in vast balls of snow, which they ram together and cover from the sun-shine. Out of these reservoirs of snow they cut several lumps, as they have occasion for them, and send them on asses to the sea-side, where they are carried off in boats, and distributed to several shops at a settled price, from which the whole city of *Naples* is supplied.

While the banditti continued their disorders in this kingdom, they frequently put the snow-merchants under contribution, and threatened them, if they proved tardy in their payments, to destroy the magazines; which, it is said, they might easily have done, by the infusion of some barrels of oil.

S E C T. III.

Of the natural and artificial Curiosities, and principal Places in the Terra di Lavoro; particularly the Grotto of Paulilipo, the Sudatories of St. Germano, the Grotto del Cani, the remarkable Valley of Solfatara, the Cities of Puzzuolo and Capua; with several remarkable Lakes, &c.

ON the road from the beautiful suburb of Chiaia is the grotto of Paulilipo, which the common people of Naples believe to have been formed by magic, and that Virgil was the magician. To form a just idea of this place, says Addison, the reader must imagine a vast rock undermined, with a passage and highway through it, near as long and as broad as the mall in St. James's park. This subterraneous passage is much improved since Seneca gave so bad a character of it. The entrance at both ends is higher than the middle, and sinks by degrees to throw in more light upon the rest, each entrance being about eighty or a hundred feet high. Towards the middle are two large funnels, bored through the roof of the cavern, to let in light and fresh air. The bottom of it is paved with broad stones like the streets of Naples, and is cleaned several times in a year, and then it is pretty free from dust; but as it is a road extremely frequented, this convenience is of no long duration. As the breadth is between eighteen and twenty feet, there is sufficient room for two carriages to avoid each other. Near the middle of it is an oratory hewn out of the rock, with a lamp continually burning in it. This is certainly a very antient work of art, yet there are no vast heaps of stones to be seen about the mountain, though the great quantities of them could not certainly be concealed, had they not been consumed in the moles and buildings of Naples. This confirmed me, says Mr. Addison, in a conjecture which I made at the first sight of this subterraneous passage, that it was originally not so much designed for a highway, as for a quarry of stone; but that the inhabitants finding a double advantage by it, hew'd it into the present form. The same design was perhaps the original of the Sybil's grotto, considering the prodigious multitude of palaces that stood in its neighbourhood. When I was at Chateaudun, in France, the same gentleman adds, I met with a very curious person, a member of one of the universities of Germany, who had staid a day or two in the town longer than ordinary, to take the measures of several empty spaces cut in the sides of a neighbouring mountain; some of them were supported with pillars formed out of the rock; some resembled galleries; and some were not unlike amphitheatres. The gentleman had formed several ingenious hypotheses relating to the use of these subterraneous apartments, and from thence made several observations on the magnificence and luxury of the antient Chateaudunois; but communicating his thoughts on this subject to one of the most learned persons of the place, he was not a little surprized to hear, that these stupendous works were only so many quarries of free-stone wrought into different forms according as the veins of it directed the workmen.

On this mountain they shew a tomb of Virgil, though it is well known that this celebrated poet was buried on the other side of the city, towards Mount Paulilipo, it being pleasantly variegated with churches, convents, and vineyards that produce excellent wine.

On leaving the grotto of Paulilipo, you turn off on the right hand into a very pleasant road, which running between fine vineyards, leads to the lake of Agnano, which is almost a perfect circle about an Italian mile in circumference. At high water in some parts of it is seen a strong ebullition. On approaching near it one is sensible of the motion of the water, which possibly proceeds from the ascent of the effluvia. The tenches and eels in this lake have in winter a very good flavour; but in summer are not eatable, which is in some measure imputed to the great quantities of flax and hemp brought thither from all the neighbouring parts, and put in the water to be mellowed.

Near this lake stand the sudatories of St. Germano, which consist of several apartments built with stone; where the heat and sulphureous vapours issuing from the earth soon cause a profuse sweat; in some places the wall is too hot for the hand to bear it, and yet the heat is supportable in the hottest room, especially if you stoop towards the ground. The same observation is made on the baths of Tritoli. The patients are put into rooms of different degrees of heat, according to the nature of their complaint; and in the sudatories of St. Germano, which are said to be very efficacious in the gout, debilities, inward heats, &c. they never stay above a quarter of an hour at a time.

Within an hundred paces of these salubrious sudatories, is a small natural cavern known by the name of the Grotto del Cani, or the Dog's grotto, that animal being generally chosen to prove the surprizing effect of the vapour in this cavity. It is about twelve feet in length, five broad, and six high, and is famous for the poisonous steams which rise above its surface. The sides of the grotto are marked with green as far as the vapour reaches. The common experiments are holding the dog with his nose in the vapour, by which means he soon loses all signs of life; but on his being carried into the open air, or thrown into a neighbouring lake, if he is not quite dead, he immediately recovers. A torch dipt into the vapour goes out in a moment, snuff and all; and within it a pistol cannot take fire. Mr. Addison split a reed and laid a train of gunpowder in the channel of it; then placing one end of the reed above the vapour, and the other at the bottom, found that the vapour could not intercept the train, nor hinder it from running to the very end; and, by repeating the experiment, so far dissipated the vapour, that he could easily let off a pistol in it. A viper being put in it bore the vapour nine minutes, and the second time ten; but on its being brought out after the first trial, it took such a vast quantity of air into its lungs, that it swelled nearly twice as big as before, and upon this extraordinary stock of air it perhaps lived a minute longer than before. Dr. Connor attributes the extinction of lights and the death of animals in this grotto to the great rarefaction of the air, caused by the heat and eruption of the steams. "The heat is, however, very inconsiderable; but to satisfy myself, says Addison, I placed a thin vial, well stopped with wax, within the smoke of the vapour, which certainly would have burst in an air so rarefied as to kill a dog or quench a torch; but nothing followed upon it. However, to remove all farther doubt, I borrowed a weather-glass, and fixed it in the grotto in such a manner that the stagnum was entirely covered with the vapour; but after half an hour's standing in it, I could not perceive that the quick-silver sunk. It is generally supposed that this vapour is sulphureous, but I could see no reason for such a supposition: upon my dipping my hand into it, it left no smell upon it; and though I put a whole bundle of lighted brimstone matches into the smoke, they all instantly went out, as if immersed in water. Whatever be the composition of the vapour, let it have but one quality of being very viscous or gluey, and I believe it will mechanically solve all these phaenomena. Its unctuousness will render it heavy, and unfit for mounting, unless the heat of the earth was much greater than it is, to rarify and scatter it. It will be too thick and gross to keep the lungs in play for any time, so that animals will die sooner or later, in proportion as their blood circulates slower or faster. Fire is as soon extinguished in it as in water, from its wrapping itself in the same manner about the flame, and hindering, by its continuity, any quantity of air and nitre from approaching it; but as its sparks are no less compact than those of liquors, they are not so tenacious as to intercept the fire that has once caught a train of gunpowder, on which account they may be quite broken and dispersed by repeating this experiment."

Solfatara is a little valley, which, together with the neighbouring mountains, is of a yellowish colour, with smoke issuing from several parts. Upon widening the holes from whence it proceeds, and digging to some depth, the

the heat soon becomes so excessive, that there is no approaching them. The stones that lie round such openings are in a continual agitation, and upon throwing to the ground a handful of small pieces of money, some are tossed eight or ten feet high in the air. Even in some places the mere exhalations without smoke continually throw up the sand, and keep it suspended. Thus this valley may be deemed the miniature of Vesuvius; and though that mountain is upwards of eight miles distant, there appears to be a subterraneous communication between it and this valley, it being observed, the thicker the smoke is here, the more quiet Vesuvius is; and the more violent the eruptions of the latter, the less smoke is observed to proceed from Solfatara. The ground is almost every where hollow; for if a stone be thrown upon it, a long subterraneous echo ensues; but if a large stone be cast into one of the holes that have been dug, the noise is almost as great as that of thunder. Here are prepared sulphur, vitriol of a sapphire colour, esteemed better than that of Rome, and likewise alum to the greatest perfection. The large leaden kettles used in this operation, are not heated by any fire of wood or coals, but only by the natural heat of holes in the ground over which they are placed. The people in general believe that these apertures are spiracles, if not of hell, at least of purgatory; and it is pretended that ghosts often appear in these parts, making dreadful lamentations; and these idle notions are very carefully promoted by the monks of a capuchin convent in the neighbourhood, to render the people more tractable.

The church of the above convent is built on the spot where St. Januarius is said to have been beheaded; and there is always a great heat felt in the church, which is principally emitted from some holes near the high altar. A great quantity of salt-petre is to be seen on the walls of the vestry. That the monks may be provided with cool and wholesome water, their reservoir stands upon a pillar inclosed with a wall, out of the reach of the warm and sulphureous exhalations.

In the neighbourhood of this valley are a great number of subterranean passages that have a communication with each other, and seem to have been so many reservoirs of water for the old city of Puteoli, which extended to this valley; as appears from an amphitheatre in this neighbourhood, that anciently stood in the midst of that city.

Portici, a village near Vesuvius, and between seven and eight miles from Naples, where a royal palace was built by the present king of Spain, when king of the Two Sicilies, with a valuable museum of antiquities.

At a small distance from Portici, anciently stood the city of Heraclia or Herculaneum, which in the reign of Nero was for the better part destroyed by an earthquake, and afterwards, in the first year of the reign of Titus, overwhelmed by a stream of the lava of Vesuvius. In the years 1689 and 1711, upon digging into these parts, somewhat of this unfortunate city was discovered; but since the year 1738, farther searches having been made at a considerable expence, stately buildings made their appearance, and from among the rubbish were taken a multiplicity of invaluable antiquities, as paintings, statues, bustoes, books, furniture, and various utensils, and the search is still continued.

At the distance of eight miles from Naples is Puzzuolo, the ancient Puteoli, which in the time of the Romans was a considerable city, but at present is only a small town on a bay, where the great quantity of beautiful stones and gems cast up by the sea, afford a sufficient proof of its former splendor and magnificence. The greatest part of these stones are of a blue or red cast, and there are frequently found among them pieces of verde antico and porphyry, which seem to have been used in Mosaic work; likewise agate, cornelian, amethysts, jasper, onyx, beryl, and lapis-lazuli. The old city has been entirely destroyed by the ravages of war, inundations, and earthquakes.

The cathedral is built with large blocks of marble, and was converted from a pagan temple into a Christian church, dedicated to St. Proculus and St. Januarius, whose statues of marble stand in the middle of the church. At the entrance on the left hand is a beautiful altar of inlaid work, with a very costly tabernacle. On the high

altar the beheading of St. Januarius is extremely well painted.

This city values itself on its having been honoured with the first Christian community in Italy, St. Paul in his journey to Rome having found brethren there.

In the square of Toledo is a fountain adorned with a fine statue of St. Januarius, and an ancient Roman statue of fine marble dug up without the city. The harbour of Puzzuolo is very commodious, and is formed by fourteen piers, or pilasters, rising above the surface of the water, which were anciently joined together by arches, and on the sides of these pilasters are vast stones with holes in them for fastening ships, &c. Formerly there were twenty-five of these pilasters; but some of them have been totally demolished, and others do not rise so high as the surface.

The sea about this city abounds in fish, especially of the testaceous kind. Here is a small fish not quite an inch in length, called *cavallo marino*, or sea-horse, and is generally dried for keeping: the head very much resembles that of a horse. It is often bruised with vinegar and honey, and applied by way of plaster to the part bitten by a mad dog, and the women eat them to procure a good breast of milk.

The Lucrine lake, famous among the Romans for its fine oysters, and great abundance of other fish, lies near the shore, and at present is very small, it having been for the most part dried up by a new mountain which rose instantaneously in the night, between the nineteenth and twentieth of September 1538, during an earthquake which caused a terrible devastation in the neighbourhood. The subterraneous fire, after making a wide chasm, ejected such a quantity of stones, ashes, sulphur, and sand, as within twenty-four hours formed this mountain; the perpendicular height of which is not less than four hundred rods, and the circumference three Italian miles.

The lake of Averno lies in a narrow valley, and is nearly of the same size as the lake of Agnano; but its water has not the quality ascribed to it by Virgil, and other authors, who represent its poisonous exhalations as almost instantaneously killing the birds that attempted to fly over it. At present fowls are observed not only to harbour about, but even to swim upon it; it is stocked with fish, and the land all round produces fine fruit and excellent wine: for Augustus having caused the woods about it to be cut down, the country became more healthy, and the lake was no longer formidable. This lake is in some places an hundred and eighty feet deep; and some old walls standing near it, are supposed to be the remains of a temple of Apollo.

In the same valley is the entrance into the grotto of the sibyl Cumana, which is hewn in the rock, and after one enters, stooping very low, is found to be about ten feet in breadth, twelve in height, and several hundred paces in length. The story of a sibyl's residing here is unquestionably fabulous.

The shore of the bay where anciently stood the city of Baia, was once covered with magnificent edifices, as appears from the ruins of the emperor Nero's palace at this place, and particularly by the remains of the warm baths at Tritoli, the reservoirs of which are cut in a rock after a very surprising manner. The steam of the water is of such intense heat, that no person can proceed beyond twenty paces into the passage leading to it. These baths are at present used for the same disorders as the sudatory of St. Germano. At the foot of the hill are several other baths, and particularly one called St. George, in which the water is only luke-warm. On the shore are the remains of a palace of Julius Cæsar, and of the temples of Diana and Venus.

Caserta is a small town, the see of a bishop, and the capital of a small principality. Here is a royal palace which has been lately built, and is said to have cost an immense sum.

Capua is now a small town on the river Volturno, fifteen miles to the north east of Naples; it has some inconsiderable fortifications, and several fine houses and churches. The present town was built in the year 856, and in 869 was made the first archbishopric in the kingdom of Naples. The ancient celebrated city of Capua, which

which vied in magnificence with Rome and Carthage, stood two Italian miles from the modern, and out of its ruins was built the market town of St. Maria, in the environs of which are still seen the remains of palaces, temples, and other buildings, particularly a beautiful amphitheatre of free-stone. The neighbouring country produces great plenty of the finest fruits and wine.

There are several other small cities and towns in the Terra di Lavoro; but as they contain very little that is worthy the notice of the curious, we shall proceed to describe some islands on the coast of that territory.

SECT. IV.

Of the Islands on the Coast of the Terra di Lavoro, particularly Caprea, Nisida, Procita, and Ischia.

IN describing the islands on the coast of the country last described, we shall begin with Capri, the ancient Caprea, to which Augustus Cæsar often came for his health and recreation, and Tiberius made it a scene of the most infamous pleasures. This island lies three Italian miles from that part of the main land that projects farthest into the sea. It extends four miles in length from east to west, and about one in breadth. The western part is, for about two miles, a continued rock, vastly high and inaccessible next the sea; yet Ano Capri, the largest town of the island, is situated here; and in this part are several places covered with a very fruitful soil. The eastern end of the island also rises up in precipices that are nearly as high, though not quite so long, as the western. Between the rocky mountains at each end, is a slip of lower ground that runs across the island, and is one of the pleasantest spots imaginable; it is covered with myrtles, olives, almonds, oranges, figs, vineyards, and corn-fields, which look extremely fresh and beautiful, and afford a most delightful little landscape, when viewed from the tops of the neighbouring mountains. Here is situated the town of Caprea, two or three convents, and the bishop's palace. In the midst of this fertile tract rises a hill, which in the reign of Tiberius was probably covered with buildings, the remains of which are still to be seen. But the most considerable ruins are those at the very extremity of the eastern promontory, where there are still some apartments that are very high and arched at the top: these appear to have been either bathing places, or reservoirs of water. From this place there is a very noble prospect; on one side of it the sea extends farther than the eye can reach; just opposite is the green promontory of Sarentum, and on the other side the bay of Naples. What recommended this island to Tiberius was its wholesome air, which is cool in summer and warm in winter, and its inaccessible coasts, which might be defended by a handful of men against a powerful army. The whole island was probably cut into several easy ascents adorned with a variety of palaces, and planted with as great a number of groves and gardens as the situation of the place would allow; yet the works under ground were more extraordinary than those on its surface; for the rocks are undermined with grottos, galleries, bagnios, and other subterraneous retirements, that suited the voluptuous life of the emperor.

It would appear surprizing that so few remains of those many works of art are now to be seen, were we not informed, that after Tiberius's death, the Romans sent thither an army of pioneers in order to deface the beauties of the island.

In sailing round Caprea, says Mr. Addison, I was entertained with many rude prospects of rocks and precipices, that in several places rise half a mile in perpendicular height, and at the bottom are caves and grottos formed by the continual breaking of the waves upon them. In entering one, called by the inhabitants Grotto Oscuro, after the light was a little worn off my eyes, I could distinctly see all the parts of it, by a glimmering reflection that played upon them from the surface of the water. The mouth is low and narrow, but after having entered pretty far in, the cavern opens on both sides in an oval figure of a hundred yards from one extreme to the other. The roof is vaulted, and distils

fresh water from every part, which fell as fast as the first droppings of a shower. Those of the inhabitants and Neapolitans who have heard of Tiberius's grottos, maintain that this was one of them; but many reasons shew it to be natural, for besides the little use of such a dark cavern of salt waters, it has no marks of the chissel. The sides are of a soft mouldering stone, and there are seen many of the like hollow spaces worn in the bottoms of the rocks, as they are more or less able to resist the force of the water that beats against them.

The island of Nisida is seated at a small distance from the main land, and is a kind of large garden laid out in beautiful slopes and terraces, adorned with a variety of plantations, rising above each other. It is said to bring its proprietor a yearly income of eight thousand ducats. Towards the south it has a small harbour, called Porto Pavone, and on a neighbouring rock stands a lazaretto, where ships bound for Naples are obliged to perform quarantine.

The isle of Procita, which belongs to the marquis of Vasto, though not above six miles in circuit, has about four thousand inhabitants, and produces abundance of good fruit and wine. A little town of the same name stands on its south peak, and on the shore opposite the main land is a market town.

The island of Ischia, which stands farther out into the sea, at two miles distance from Procita, was by the ancient poets called Inarime. These represent Typhæus as lying under it, on account of its fiery eruptions; but there have been none of these for near three hundred years: the last was very terrible, and destroyed a whole city; but at present there are scarce any marks of a subterraneous fire: there are indeed several cracks through which a smoke constantly issues; but it probably arises only from the warm springs that feed the many baths and dry sudatories with which this island is plentifully stored; for about one of these breathing passages a number of myrtles flourish within the steam of the vapours, and have a continual moisture hanging upon them. This island, including the projection of its small promontories, is ten miles in circumference, and is very mountainous, but produces great store of fruit, good wine, and game. The little town and castle of Ischia, on the north end of the island, stands upon a very high rock, divided by the sea from the island, but joined to it by a bridge. This island is the see of a bishop.

SECT. V.

Of the other Provinces of Naples, called the Principato Citra and Ultra, or the Hither and Farther Principality, and the Basilicata or Basilicate; their Situation, Extent, and principal Cities.

THE province called the Principato Citra, or the Hither Principality, had its name from the following circumstance: in the time of Arechis, duke of Benevento, this country, together with the Principato Ultra, formed only one principality; but Radalchis and Siconolf, having divided it between them, that part lying on this side the Appennine mountains received the name of the Hither Principality, and that on the other side the Farther Principality.

The Hither Principality is bounded on the north by the Farther Principality, and part of Campania Felix: on the south and west by the Tuscan sea; and on the south-east by the Basilicate; extending in its greatest length from the north-west to the south-east about sixty miles, and in its greatest breadth from north to south about thirty. The soil produces corn, wine, oil, and saffron, and they have a great deal of silk.

The principal towns in this province are the following.

Salerno, in Latin Salernum, the capital of the province, is situated near the sea, in the fortieth degree forty-six minutes north latitude, and in the fifteenth degree twenty-six minutes longitude, and stands in a plain surrounded with fertile and delightful hills; it has a pretty good harbour, though it is little frequented, yet is fortified and defended by a castle. It became an archiepiscopal

copal see so early as the year 974. Its school was formerly in great request, on account of the Arabians or Saracens resorting to it in great numbers, under the princes of the Longobardi, and from them the inhabitants learned philosophy, and especially the practice of physic, for which the Arabians were then highly celebrated. This school was at last raised to an university. Salerno has no buildings worth notice, except the cathedral, some convents, and the town-hall. The streets, as in most ancient cities, are narrow and uneven; there are indeed but two principal streets; these run parallel, and are crossed on both sides by all the others.

Scava, a small but well inhabited city, is the see of a bishop immediately subject to the pope, and is situated on the north-east coast of the gulph of Salerno, about four miles from that city.

Amalfi is a small city on the bay of Salerno, about twelve miles to the west of that city: it is an archiepiscopal see, and is honoured with the title of a principality. It was built in the year 600, and was formerly a considerable and powerful place, it being the seat of a republic which maintained its freedom till the year 1075. It is pretended that the use of the mariner's compass was first discovered in this city by Flavius Blondus, about the year 1300.

There are a considerable number of small towns in this district, most of which are the see of a bishop, but are too inconsiderable to deserve notice.

The Principato Ultra, or the Farther Principality, is seated in the middle of the Appennines, and is bounded on the north by the Molise and the Capitanata; on the east by the Capitanata and the province of Barri; on the south by the Hither Principality, and part of the Basilicata; and on the west by the Terra di Lavora. Its extent from north to south is about thirty miles, and from east to west about forty-eight.

Benevento, the capital of the province, is a large and handsome city, and the see of an archbishop, situated in the forty-first degree fifteen minutes latitude, and in the fifteenth degree thirty minutes east longitude; thirty-four miles to the north-east of Naples, and fifteen from Capua. It has suffered greatly by earthquakes, particularly in 1688, when the archbishop, afterwards pope Benedict XIII. was dug out alive from among the ruins; but when he was advanced to the papal chair he rebuilt the city, which is at present subject to the pope, and is seated in a delightful and fertile valley near the confluence of the rivers Saboro and Calore.

There are in this principality a considerable number of small cities, which have the honour of being the see of a bishop, and many small market towns.

The Basilicata, or Basilicate, is partly surrounded by the ridge of the Appennine mountains, which near Venosa, in this province, is divided into two branches; both of which extend to the sea. It formerly comprehended the largest and best part of the ancient Lucania, and though very mountainous, produces corn, wine, oil, saffron, cotton, honey, wax, and fruit. It is bounded on the north by the Capitanata; on the east by the gulph of Tarento, and part of the territory of Barri; on the south by Hither Calabria; and on the west by the two principalities just described.

The principal places in this province are,

Acerenza, the ancient Acherontia, a small town with the title of a dukedom belonging to the house of Caraccioli, and was formerly an archiepiscopal see, which was translated to Matera, in the territory of Otranto. It is seated on the river Brandano, at the foot of the Appennines; but is a small town poorly peopled, and daily running to decay, as are most of the cities in the Basilicate.

S E C T. VI.

Of the Provinces of Calabria, Citra and Ultra, or Hither and Farther Calabria: Their Situation, Produce, and principal Cities.

CALABRIA Citra, or Hither Calabria, was formerly called the Valley of Crate, and was esteemed a part of Græcia Magna. Calabria in general received its name

from the last Greek emperors, and is bounded on the north by the Basilicate; on the east by the gulph of Tarento; and the Ionian sea; and on the south and west by the Mediterranean.

This country produces abundance of fruit, corn, wine, oil, flax, hemp, sugar, rice, saffron, honey, cotton, and silk.

As manna is chiefly produced in Calabria, it will be proper here to take notice of that excellent drug, which exsudes from a kind of ash-tree very common in this country: for in the heat of summer it flows from it, in a white sweetish juice or gum. There are three kinds of this Calabrian manna; one called *manna di corpo*, which is the finest, and is spontaneously discharged from the trunk and large branches of the tree, in the form of a crystalline liquor, which hardens into grains of different sizes, and is carefully gathered the succeeding day. The second species, called by the Italians *manna forzata*, or *forzatella*, is obtained by making incisions in the bark in the month of August, after the natural discharges cease. From these incisions the manna flows copiously from noon till towards midnight, and is the next day exposed to the sun in order to be dried; but this sort is less esteemed, on account of its impurity and yellow colour. The third species, called *manna di Frondi*, issues spontaneously, like a kind of sweat, from the leaves, on which the drops are indurated by the sun into grains about the bigness of wheat; but this last sort is not constantly gathered on account of the difficulty of separating it from the leaves. That manna is reckoned best which is white and new, the dark coloured and brown being old and decayed.

This country is said to have also mines of gold, silver, and iron; together with sulphur, alabaster, and rock crystal.

The principal cities of Hither Calabria are:

Consenza, the antient Consentia, the capital of the province, and the seat of the tribunals of justice. It is situated in the thirty-ninth degree twenty-five minutes latitude, and in the sixteenth degree thirty-nine minutes longitude, on the river Grati, near the place where the Valento falls into it, and at the foot of a hill opening into a most delightful and spacious plain. It is the see of an archbishop, who has a considerable revenue, tho' he has only one suffragan, the bishop of Martorano.

Rossano, a small city, with the title of a dukedom, a hundred and forty miles to the south-east of Naples, is situated on a hill almost entirely surrounded with high rocks, and upon a small river that falls a little below it into the Salano: it is also the residence of an archbishop; but he has no bishop under him.

Paola, or Paula, a well built little city at a small distance from the sea, stands thirty miles west by south of Rossano, and belongs to the house of Spinelli. The inhabitants boast of its being the birth-place of St. Francis, the founder of the order of Minims. Here are convents of Jesuits, Augustines, Franciscans, Capuchins, and Dominicans; but the convent of Minims of the order of St. Francis of Paola, is situated a mile from the city, and has a fine church. At a little distance from the town is the palace of prince Francavilla, situated between two hills. This province has also several other little cities and small towns.

Calabria Ultra, or the Farther Calabria, antiently called Terra Jordana, is the farthest province of Italy, and is surrounded by the sea, except where it joins to Hither Calabria. It has but few towns of any note; but the most considerable of them are the following:

Reggio, distinguished by the appellation di Calabria, is a small town situated opposite the island of Sicily. Tho' it is seated near the sea, its port is only fit for very small vessels, which lie exposed to all winds; and though it is an archiepiscopal see, it is neither large, rich, nor well peopled. It has two convents, or colleges, one of Jesuits and the other of Dominicans, and in both are taught humanity, philosophy, and theology. The streets are narrow, and the buildings mean and in the old taste; but though the cathedral is small, it is neat, and has a noble chapel, in which is a stately cupola, and is adorned with porphyry, different kinds of marble, sculpture, and painting.

In this city is a singular kind of manufacture of what they call fish-wool. It is taken from a shell-fish that resembles a large muscle, but is hairy; and this hair, which is longer or shorter according to the largeness or age of the fish, being well soaked in fresh water and washed, is carded, spun, and knit into waistcoats, stockings, gloves, petticoats, caps, &c. and though lighter than cotton or silk, is so warm that the winds in the severest winters cannot penetrate through it. Such quantities of this work are fabricated here and in the neighbourhood, that it is bought very cheap; but when the traders carry it to the great cities of Italy, they raise the price to an extravagant degree.

Tropea, a city situated in a small plain on the top of a high rock, that affords a fine prospect of the fertile fields of Calabria, and on the other side of the sea. It stands about thirty-nine miles to the north of Reggio, and the ascent to the city is by a spacious street adorned with gardens before the houses on each side, and being continued in the same line within the gates, divides the city into two parts. The rest of the streets are narrow, and the cathedral is a plain antient structure; for the city has been an episcopal see under the archbishopric of Reggio, ever since the eighth century. At some distance without the city are several small rocks, on which are built little forts.

SECT. VII.

Of that District of Naples termed Apulia, including the three Provinces of the Capitanata, Barri, and Otranto: their Situation, Produce, and principal Cities; with a concise Account of the Islands situated on the Coast, and of the Provinces of Hither and Farther Abruzzo.

APUGLIA, or Apulia, includes the three territories of the Capitanata, Barri, and Otranto; but it is only in a more extended sense that the first can be said to belong to it. It is situated between the Appennine mountains, which bound it to the south, and the Adriatic sea, its northern boundary.

Apulia, especially the two first territories included in it, being a level country, with few or no hills, is in such want of springs and rivers, that the inhabitants have no other water for drinking than the rain saved in cisterns, either in their houses, or built at the public expence in the open market-places. The cattle drink also rain-water out of reservoirs formed by nature among the rocks. The dew in this hot country, from the proximity of the sea, is very copious, and serves to refresh the corn-lands and vineyards instead of rain: but, during the excessive heats, the garden-grounds are watered day and night from the wells, which yield only a brackish fetid water. However, in the parts from Manfredonia, as far as Mount Gargano, are springs of fine sweet water. The coast between the town of Manfredonia and Barletta is one continued heap of sand, which has probably been for some centuries thrown up by the sea, where it forms a kind of bay. In some places the sand lies several fathoms high, and has nothing growing upon it but myrtle, shrubs, and herbs, with deep roots that shoot down towards the water: yet this place, though naturally so wild and desert, produces several advantages. In the adjacent sea, which is shallow, the fishermen, during the months of April and May, make considerable profit by catching a kind of cuttle-fish. For this purpose the fishermen throw into the sea some bundles of myrtle, and the fish coming to them to spawn, are caught in nets.

The only fuel the fishermen have to boil their fish with is the dried dung of buffaloes, which they gather along the coast, no inhabited place being near at hand where they can provide themselves with necessaries. To this coast herds of buffaloes resort, and during the heat of the day lie in the water, the waves at flood beating over them. In this sandy spot, particularly towards Barletta, are planted gardens and vineyards; the beds of the gardens are here covered with branches of myrtles, that the winds may not disorder them by tearing up the sand, and the plants receive their chief nourishment from the sea-

water imbibed by their roots; for the stocks of their vines are set so deep in the sands, that the sea penetrates to them; and the like is observed with respect to esculent plants, as melons, pumpions, and cucumbers. Hence the wine produced here has a saltish taste, but the water-melons are incomparable, and are sent even to Naples, being reputed a most delightful refreshment in the hot summer months. On the bay of Tarentum are likewise broad, waste, and uninhabited tracts, consisting entirely of sand-hills, which only produce junipers with red berries, and a few other shrubs and plants.

The other part of the country is much more fertile, Apulia producing great quantities of corn; but the air being excessively hot, it is in some years all burnt up. The Jesuits are the proprietors of half this province, and are said to treat their tenants with the same rigour as the Neapolitan lords frequently exercise towards their farmers; so that Burnet says, they sometimes die of hunger even in the most plentiful years, from the cruel custom of exporting their corn.

We shall now give an account of the three provinces included under the name of Apulia.

The country of Otranto, which was a part of the antient Calabria, is bounded on the north by the territory of Barri, and by the gulph of Venice; on the east by the same gulph; and on the south and west by a great bay, which is between that province and the Basilicate. Within land it is very mountainous, dry, sandy, and in some parts barren; but in most places abounds in wine, olives, figs, and other fruit. But the country is frequently infested with locusts, which at certain seasons come in such swarms, as threaten the destruction of all the produce of the earth; but Providence has remedied this evil by sending at the same time birds which devour them. This province is also infested with tarantulas, especially in the district of Tarento. It is likewise frequently visited by Algerine pirates, who not only ravage the country, but carry all the people that fall into their hands into slavery. To prevent this they have built a great number of forts all along the coast, in which are garrisons.

Notwithstanding these disadvantages, the province of Otranto has a considerable number of cities and towns, four of which are archiepiscopal; these are Otranto, Tarento, Brindisi, and Matera; and ten episcopal.

Otranto, the capital of the province, is situated in the fortieth degree five minutes north latitude, and in the nineteenth degree twelve minutes east longitude, on the mouth of the Adriatic, on the eastern coast of Italy. It is seated on a rocky island, joined by a bridge to another island, which also by a bridge has a communication with the continent. It has a good harbour and a considerable trade, and is defended by walls, bastions, and a citadel.

Tarento, the antient Tarentum, is a small city seated on a peninsula that projects into a bay of the same name, and had once a fine harbour; but it is now so shallow as to admit only fishing-boats. It has a pretty strong fort, and the bay is famous for fresh water springs at the bottom. It has still several monuments of its antient grandeur, as the ruins of a stately theatre and other public buildings; but though it was once the head of a republic, which even made war on that of Rome, it is now small and chiefly inhabited by fishermen. This city gave name to the spiders called tarantulas, already described.

Brindisi, the antient Brundisium, is situated on the Adriatic coast, thirty-two miles to the east of Tarento, and had once a convenient harbour, which has been spoiled by the Phoenicians; and since it has had this loss it has much declined, and is now nothing near so large as it was formerly.

Gallipoli is seated on a high and craggy rock in the gulph of Tarento, and though small is very strong and well inhabited. It is surrounded by the sea, having a communication with the continent by a bridge defended by a good fort, and has a pretty good trade.

Matera is an inland city on the western side of the province, and is seated in a valley by the river Canapro, ninety-five miles to the north-west of Otranto. It is pretty large, and is computed to contain about three thousand families.

The

The country of Barri, or Bari, is bounded on the north and east by the Adriatic sea; on the west by the Capitanata, from which it is divided by the river Offanta; and on the south by the Basilicate. It is esteemed one of the most fertile and best cultivated provinces in the kingdom of Naples, especially towards the Adriatic sea, along which it has its greatest extent. Its principal cities are the following:

Barri, or Bari, the capital of the country, stands on the Adriatic sea, in the fortieth degree forty minutes north latitude, and in the seventeenth degree forty minutes east longitude, and is the see of an archbishop. It is pretty large and well inhabited, and had formerly a good haven, till it was spoiled by the Venetians.

Trani, in Latin *Tranium*, is seated in a fruitful plain on the coast of the Adriatic, about twenty miles to the west of Barri. The inhabitants say it was built by Trajan, and from him was antiently called *Trajanum*. It has been erected into an archbishopric ever since the ninth or tenth century. The city is handsome, well built, and is defended by a castle; but is small, though the courts of judicature for this province are held there.

The Capitanata, or Capitanate, the antient *Apulia Daunia*, is bounded on the north and east by the Adriatic; on the north-west by the Molise; on the south by the Farther Principate, the Basilicate, and Barri. Its soil is naturally dry and sandy, the grass short, but sweet, and feeds a great number of cattle, which are driven thither from the Abruzzo.

There are hardly any woods in this country; but there are several lakes and some considerable rivers. The principal of the latter are the Offanta, Carapella, Cervaro, Candelare, Fortore, and the Tiferno. The only mountain of note in this province is called Gargano, or Monte Sant Angelo, and extends itself through a great part of the province. On the top of it is a convent, where particular devotion is paid to Michael the archangel. On the same mountain is situated a town called Monte Sant Angelo, which is the see of a bishop.

Manfredonia, the capital of the province, was built out of the ruins of the antient *Sipontum*, and is situated at the foot of Monte St. Angelo, upon which it has a castle, and before it a port on the Adriatic. It had its name from Manfred, natural son to the emperor Frederic II. who rebuilt it in the year 1256; but has been in a very low condition ever since the year 1620, when it was surprized and taken by the Turks, who carried off all its cannon, bells, &c. and set it on fire. The city is small and thinly inhabited, and the haven being choaked up, is only fit for small vessels. It is, however, an archiepiscopal see.

Most of the other towns of this province are very inconsiderable, we shall therefore leave them to take notice of some islands, situated off the coast of this province in the Adriatic sea. These are the *Tremiti*, which consists of St. Nicolo, or Tremiti, St. Domino, and la Capraria; the principal of which is St. Nicolo, which is inhabited by a set of monks, who have surrounded it with high walls flanked with towers, to which are added four strong bastions. Near the shore is likewise built a small arsenal for the rigging of ships. The monastery, which is a spacious and magnificent edifice, has a large cistern in the center of the cloister, for the use of the monks, besides ten or a dozen more for that of the other inhabitants. The church, which has a high roof, and three stately isles, is a hundred and seventy feet long, and seventy broad. The choir and pavement are very beautiful, as is also a chapel enriched with offerings of immense value, in which they pretend to have a miraculous image of the Virgin, and a miraculous crucifix. The island is of an oblong irregular figure, and in the middle almost divided by a narrow isthmus.

St. Domino is the next in bigness; it is about ten miles distant, and is very rocky and craggy, as are the other two islands, which may be rather termed huge rocks, and are not worth describing.

Abruzzo Ultra, or Abruzzo beyond the river Pescara, is bounded on the north-east by the Adriatic sea; on the south-east by the Hither Abruzzo; on the south-west by Sabina, and the Campania of Rome; and on the north-west by the marquise of Ancona. This country is cold

and mountainous, it being crossed by the Appennines; but is fertile, and produces corn, fruit, and saffron. It is healthy, pleasant, and well inhabited; and the people, who are tolerably industrious, have some manufactures.

Aquila, the capital of the province, is situated on a little hill, at the foot of which runs the river *Alterno*, and has an antient castle. It was once a handsome city; but, on the second of February, 1703, was almost destroyed by a dreadful earthquake. The first shock was so terrible, that the inhabitants abandoned the city; but returning to hear vespers, it being Candlemas-day, the shock returned, and two thousand four hundred people perished, eight hundred were destroyed in one single church, and the greatest part of the city, with its walls, were thrown down.

The other towns in this province are very inconsiderable.

Abruzzo Citra, so called from its being on this side the river Pescara, is bounded on the north-east by the Adriatic; on the south and south-east by the territory of Molise; and on the south-west by that of Lavora. It has not only the Appennines running through it, but some other considerable mountains, particularly the *Majella* and *Cavallo*, the former of which is covered with perpetual snow.

The country produces plenty of corn, rice, fruit, and saffron; here are also many large woods, which shelter a great number of wolves, bears, and other wild creatures, which render it necessary to go always in troops and well armed.

Chieti, the antient *Theate*, and the capital of the province, is situated in the forty-second degree thirty two minutes north latitude, and in the fourteenth degree forty-eight minutes east longitude, and stands on a hill near the river Pescara, on the confines of the Farther Abruzzo. It is a pretty large, well built, and populous city, the see of an archbishop, who has only one suffragan, namely, the bishop of Ortona; and here the courts of judicature for the province are held. This city gave name to the order of Theatines, which was instituted in 1524 by John Peter Caraffa, who, before his exaltation to the pontificate by the name of Paul IV. had been archbishop of this city.

Lanciano, the antient *Anxanum*, is situated seventeen miles to the east of Chieti, and is the see of an archbishop, but without suffragans. A little river, to which it gives name, discharges itself into the Adriatic, and forms a kind of harbour. The city is well inhabited, and famous for its fairs, to which the merchants repair from both sides of the Adriatic.

Sulmona, the antient *Sulmo*, is situated twenty-two miles to the south-west of Chieti, and stands in a plain surrounded by mountains, between two rivulets that descend from the Appennines, besides the *Sora*, which runs by it. It is pretty well built, and full of inhabitants. This city has the title of a principality belonging to the house of *Borghese*, and is the see of a bishop. It is famous in history for being the birth-place of Ovid.

SECT. VIII.

Of the Island of SICILY.

Its Names, a concise Description of the Streight of Messina, and of Scylla and Charybdis. The Situation and Extent of the Island; its Climate, Rivers, and Produce. A Description of Mount Ætna, its Eruptions, and the dreadful Earthquakes that have laid waste the Island. The Number of the Nobility, and the Government and Arms of the Island.

SICILY is by far the most considerable island in the Mediterranean, both with respect to its size and fertility. It was antiently called *Trinacria* and *Triquetra*, from its triangular form, and *Sicania*, from the *Sicani*, its inhabitants; but the *Siculi* afterwards making themselves masters of the greatest part of the island, gave it the name of *Sicilia*. In succeeding ages, some Grecian colonies settling here, spread over a great part of the country, and their language became the vernacular dialect, till the island at last fell under the dominion of the Romans. As to its modern history, it has been touched

touched upon in our account of the kingdom of Naples.

Both the ancients and moderns have maintained that Sicily was originally joined to the continent of Italy, but gradually separated from it by the encroachments of the sea and the shock of earthquakes, so as to become a perfect island.

The strait between Sicily and Calabria, which is at most but three Italian miles broad, is called the Faro, or Pharo, of Messina, from its *faro*, or light-house, on the narrowest part, and Messina, its capital, which is situated near it. Opposite the cape of Faro, on which the light-house stands, is the rocky promontory of Scigliio, the ancient Scylla, where the ebb and flood in this strait are very irregular and strong, and, where it is narrowest, extremely impetuous; so that there is no stemming the tides, even in a strong southerly wind, on which account it is usual to have the vessel hauled up by oxen along the coast of Calabria.

The famous whirlpool Charybdis, in this strait, lies on the outside of the harbour of Messina, and was no less terrible than Scylla to the ancients. It is probable that this dangerous vortex is occasioned by the currents of the sea, which here run counter. The misfortunes for which this place was formerly rendered dreadful, are now seldom heard of; and in a calm, especially when the south wind does not blow, the place is so smooth that a small boat may safely pass over it.

Sicily extends from the thirty-sixth degree thirty minutes to the thirty-eighth degree twenty minutes north latitude, and from the twelfth degree twenty minutes to the sixteenth degree twenty-five minutes east longitude. We have already observed that it is of a triangular form, and its utmost length from east to west, that is from Cape Faro to that of Boco, is computed at somewhat more than two hundred and ten miles; its breadth from north to south, from Cape Faro to that of Passaro, is a hundred and fifty miles, and its whole circuit about six hundred.

The climate of this island is so hot, that even in the beginning of January the shade is refreshing, and chilling winds are only felt a few days in March, and then a small fire is sufficient to banish the cold. The only appearance of winter is found towards the summit of mount *Ætna*, where snow falls, and is preserved by the inhabitants in the following manner. They dig pits in the open air, and in them lay the snow, with straw or stubble, and salt, *stratum super stratum*, and then cover the place with earth. In summer, when snow is wanted to cool their liquors, one of these pits is opened, and the quantity of snow required being taken out, the hole is immediately closed.

In this island are found gems and valuable stones, as agate, jasper, porphyry, lapis-lazuli, marble, and alabaster; and it is equally rich in metals and minerals, as gold, silver, and copper, tin, lead, iron, and alum: it has also a variety of hot baths of very salubrious qualities, besides other medicinal waters.

The principal rivers of this country are Cantera, formerly the *Taurominius*; the *Jerretta*, the ancient *Symethus*; the *Salso*, the *Belicis*, and the *Termini*.

Though the island appears as one entire rock, the soil is exceeding fertile; it was anciently stiled the granary of Rome, and at present has not only sufficient plenty of corn for home consumption, but exports great quantities to the kingdom of Naples, which would otherwise be distressed. It is however far from being so well cultivated as formerly, several tracts lying waste, especially in the western part. Its wine is excellent, as are also most kinds of fruit, in which it abounds, together with oil, sugar, honey, saffron, and salt; the sugar is chiefly produced in the neighbourhood of mount *Ætna*.

The cattle are very fine, and all sorts of game are in considerable plenty. All the coast affords good fisheries, particularly for tunnies; and at Trapani is a considerable coral fishery. Great profits are made of silk, the cultivation of which was first introduced in the year 1130, by earl Roger, who returning from an expedition into the Holy Land, brought back with him some persons well versed in the management of silk; hence it soon spread into Naples, the Milanese, Spain, and the French pro-

vinces bordering on Italy. In short, whatever seems requisite in point of necessity, delight, or ornament, this country affords in such profusion, that the inhabitants, notwithstanding the exactions with which they have always been burthened by their sovereigns and his delegates, live at their ease, and grow rich.

As *Ætna* is the highest mountain in Sicily, it is the first discovered at a distance by sailors, to whom it presents the view of a prodigious chimney, or a very large rugged pillar. The inhabitants call it *Monte Gibello*, or *Mongibello*, that is, Mount of mounts. The ascent to it from Catanea is thirty thousand paces high; but on the side near Rondazzo, only twenty thousand. It stands separate from all other mountains; its figure is circular, and it terminates in a cone: its circumference at bottom is no less than a hundred thousand paces. The lower parts of it are very fruitful in corn and sugar-canes; the middle abounds with woods, olive-trees, and vines; and the upper part is, almost the whole year, covered with snow; yet within it is a continual fire, which, by its frequent and violent eruptions, has always rendered it very famous. Many of these dreadful eruptions are recorded in history; but we shall go no farther back than the year 1669, of which we find an account in the *Philosophical Transactions*. It then broke out on the eleventh of March, two hours before night, on the south-east side of the mountain, about twenty miles from the old mouth, and ten from the city of Catanea. The noise of the eruption was heard an hundred miles, to which distance the ashes were also carried. The matter thrown out was, like that of *Vesuvius*, a stream of metals and minerals, rendered liquid by the fierceness of the fire, which boiled up at its mouth, till it flowed over, and having run a little way, the extremity began to crust, and turning into large porous stones, resembling large cakes of burning sea-coal, came rolling and tumbling one over another, bearing down any common building by their weight, and burning whatever was combustible. The progress of the inundation was at first, for several days, at the rate of three miles in twenty-four hours; but afterwards it scarce advanced a furlong in a day, and thus continued for fifteen or twenty days together, running into the sea close by the walls of Catanea. At length it made its way over the walls into the city; but there did no considerable damage, except to a convent of *Benedictines*. In its course it overwhelmed fourteen towns and villages, containing three or four thousand inhabitants; and it is remarkable, that during the whole time of this eruption, which lasted fifty-four days, neither sun nor stars appeared.

But though Catanea then escaped the threatened destruction, it was almost totally ruined in 1693, by one of the most terrible earthquakes mentioned in history. It was not only felt all over Sicily, but at Naples and Malta; and the shock was so violent, that people could not stand upon their legs, and those who lay upon the ground were tossed from side to side, as if upon the rolling billows. The earth opened in several places, throwing up large quantities of water; and great numbers perished in their houses by the fall of rocks that were loosened and rent from the mountains. The sea was violently agitated, and roared dreadfully; mount *Ætna* threw up vast spires of flame, and the shocks were attended with a noise that exceeded the loudest claps of thunder.

Fifteen or sixteen towns, and eighteen manors, with the inhabitants and cattle, were entirely swallowed up, several other towns and villages were laid in ruins, and ninety-three thousand people lost their lives, of whom eighteen thousand were inhabitants of Catanea, very few escaping the general and sudden destruction of that city. The number of churches and convents involved in this dreadful calamity was no less than nine hundred and seventy-two. Since that time there have been two remarkable eruptions of Mount *Ætna*, one in 1753, and the other in 1755, and at the last time it raged with excessive fury.

Though the country has not for a long time been sufficiently inhabited, yet its nobility are very numerous, they being computed to amount to sixty dukes, fifty-six marquises, above an hundred earls, and a great number of

of barons. The number of churches, convents, and religious foundations is also exceeding great; the buildings are handsome, and the revenues considerable.

Here is a sovereign ecclesiastical tribunal, which judges in all disputes and affairs in which the clergy are concerned. It was originally instituted by the papal court, and the president, who is called the judge of the kingdom of Sicily, claims the respect usually paid to a legate à latere. The court of Rome has endeavoured to circumscribe the power of this tribunal; but this the king has always strenuously opposed, and forbid the clergy to appeal to Rome. Pope Urban II. having granted earl Roger and his successors the title of his native legates in Sicily, the king considers himself as an independent sovereign, not only in temporal, but in spiritual affairs. The kingdom is governed by a viceroy. Its arms are a saltire with six pales gules, and for supporters a crowned eagle sable. The king's revenues arising from this fruitful island are very considerable.

SECT. IX.

Of the three Divisions of Sicily, and the principal Places in each; with a more particular Description of the Cities of Messina and Palermo.

THE kingdom of Sicily is divided into three provinces, which are called valleys. The first is Val di Demino, or Demona; the second Val di Noto; and the third Val di Mazara.

Val di Demino, which is the nearest to Italy, extends from Cape Faro to the river Termini. The principal places in this province are the following:

Messina, antiently Zancle, and afterwards Messana, is a pretty large and well built city, situated in the thirty-eighth degree eleven minutes north latitude, and in the sixteenth degree fourteen minutes east longitude, standing partly in a plain near the sea, and partly on some rising grounds. Besides an irregular fortification, it has a citadel, of five large and regular bastions, and the neighbouring eminences, namely Castel Gonjaga, Castel Reale, Porta Reale, Consagra, Mattagrifone, and Castel Lacio, are all defended by forts. The private houses are handsome and well built, and the public edifices magnificent, especially the palaces of the viceroy and archbishop. Its churches and convents are numerous, and generally elegant structures, with considerable revenues, and the arsenal is well stored with all kinds of arms and ammunition.

The cathedral is a large spacious structure, but very antient. It is richly ornamented on the inside, particularly the high altar, by the side of which is the viceroy's throne, which is likewise very rich, and elevated on an ascent of ten or twelve broad steps. It has also several magnificent chapels, particularly one dedicated to the Virgin Mary, enriched with every thing that can be termed magnificent and costly, and is much resorted to by the inhabitants, who pretend that the Virgin sent them a letter, which is here preserved as a choice relic, and once a year carried about in procession with great pomp. The Jesuits have a college and three other houses. The archbishop's palace is large and well built. The general hospital, called the Loggia, is one of the most beautiful public buildings in the city; besides which there is a large and rich hospital for old people, foundlings, lunatics, the lame, blind, &c. which are here well kept in vast numbers; and near it is a spacious well built lombard-house, under good regulations.

The city extends itself on a rising ground along the shore with some declivity. The chief streets are large, one running parallel with the port, and Messina is well furnished with water by subterraneous aqueducts, and with all kinds of provisions.

The port is of an oval form, and so deep that ships of eighty guns may come near enough to the quay, for people to go in and out by the help of a plank. Towards the Faro, or light-house, it is inclosed by a crooked neck of land, on the broadest part of which to the east stands the citadel, and towards its west end a fort called St. Salvatore, which defends the narrow entrance

to the harbour. Near this neck of land is the lazaretto, built on a rock projecting out of the sea.

The trade of this city, though greatly declined, is still considerable, especially since the year 1728, when the harbour was declared a free port. An annual fair is held here in August, at which great quantities of foreign goods are exposed to sale. This city claims the prerogative of being stiled the capital of the kingdom; but Palermo disputes this point of precedence.

Catanea, the antient Catana, stands by the sea, near the foot of mount Ætna, and has been frequently almost destroyed by the eruptions of that mountain and by earthquakes. It is pleasantly situated upon the river Indicello, eighty-four miles to the west of Messina, and was antiently one of the richest and most powerful cities in Sicily; and particularly famous for a magnificent temple dedicated to Ceres. The cathedral was a noble building, supported by columns of fine black marble; but in the dreadful earthquake before mentioned in 1693, eleven hundred people who had sheltered themselves in this structure, where the relics of St. Agatha their great patroness were kept, were buried under its ruins, and the city in a manner destroyed: yet the fertility of the adjacent country has induced the people to return by degrees, who have since rebuilt a part of it. It is a bishop's see, under the archbishop of Mont Real.

There are a considerable number of small towns in this district.

Val di Noto extends from the river Jarreta to the south coast of the island, and also reaches to the river Salso. It contains several cities, and above forty towns. The principal places in this district are the following:

At the distance of seventy-two miles to the south-by-west of Messina, is Syracuse, antiently the capital of all Sicily, and a very flourishing republic, and was twenty-two miles in compass; but at present is extremely reduced by a series of calamities, especially by the earthquake in 1693; yet its inhabitants are now said to amount to fourteen thousand, and it still continues one of the most considerable cities in the island, on account of its advantageous situation, the commodiousness of its port, and the height and strength of its walls, which are washed on every side by the sea; for it now contains only one of the five parts into which it was antiently divided, and extends no farther than the division formerly called the Insula.

At the entrance of the port is a strong but regular castle, which has a communication with the city by a wooden bridge. In this castle is the famous spring called by the antients the fountain of Arethusa, which supplies it with plenty of water. The port is of a roundish figure, and though not every where of equal depth, has room sufficient to receive the largest vessels, or even a considerable fleet; its only fault is its not having safe anchoring ground, especially when the wind blows hard from the east and north-east.

Castro Giovanni, the antient Enna, a city much celebrated by the poets, who represent Proserpine as being carried off from the fields in its neighbourhood. It is situated near the heart of Sicily, forty-five miles to the south-west of Catanea, upon a hill to the north-west of the lake of Pergus, and has a spacious plain adorned with flowers and rivulets, near which is a cavern, whence Pluto is said to have come with his car, and to have carried off that goddess. This city is now small, but well built, and defended by an old castle.

The province termed Val di Mazara lies on the western side of the island, having Val di Demino on the east, from which it is divided by the Fiume Gronde, or Great river, and the Val di Noto on the east-south-east, from which it is parted by the river Salso, and is on the other sides encompassed by the sea. It is very mountainous, but fertile and well watered, it having near a dozen considerable rivers, and many lesser ones. The principal towns in this province are,

Palermo, the antient Panermus, the most considerable city in the province, and even the capital of the island. It is situated at the bottom of a gulph on the north coast, in a delightful and extensive plain terminated by high and fertile hills, which almost surround it on the land side, in the thirty-eighth degree ten minutes latitude, and the

thirteenth degree forty-two minutes longitude. It has been already mentioned in treating of Messina, that Palermo disputes with that city the honour of being the capital of the island; and indeed it has the houses of a great number of the nobility and gentry, several fine public buildings, and the streets are straight, large, and regular, particularly a beautiful and spacious one called Cassaro, that extends through the whole city, and has a viceroy's palace at one end, and the sea-shore on the other, to which it descends by a gentle declivity.

The viceroy's palace is not only a magnificent structure, adorned with fine sculptures, paintings, and gardens, but also serves instead of a castle, it commanding the city by its situation, and being flanked by high towers and other works. The piazza before it is noble, and adorned with the statue of Philip IV. of Spain, standing on a pedestal enriched with trophies in basso relievo, and with the statues of the four cardinal virtues on the four sides.

On one side of the palace is the great hospital of the Holy Ghost, and on the other the cathedral, an ancient structure, with four large towers, and richly adorned within. This city is said to contain upwards of a hundred and twenty thousand inhabitants; it is an archiepiscopal see, has an university, fifty-two monasteries, and twenty-two nunneries. It has several fine churches, particularly that of St. Matthew, commonly called de l'Anima, which is much admired for its architecture, beautiful marble, paintings, and stately portico. Among the other public buildings is the court of judicature, which is equally esteemed for its largeness, the magnificence of its architecture, its paintings, and other ornaments. Before it is a superb fountain, which is esteemed the most beautiful in all Italy, both from the number and elegance of the basins, which stand one over another, and from the great variety of figures which throw water into them. The city contains many other fine fountains and magnificent buildings, particularly the city gate, which is so wide and lofty that it resembles a magnificent triumphal arch, adorned with a great number of marble figures and other ornaments: it stands at one end of the long and noble street of Cassaro, as the viceroy's palace does at the other; so that from the palace through the whole length of the street you have a prospect of the sea, which through this stately gate resembles a beautiful canal of a stupendous extent.

The quay, which runs the whole length of the city, from which it is divided by a strong wall, is wide, beautiful, commodious, and one of the finest walks and places of resort about the city. The greatest part of the quay is planted with trees; so that one may walk under them sheltered from the sun and rain, with the port, the mole, the forts, and the open sea full in view. The port is very convenient for shipping; the long mole extends about two hundred fathoms towards the south, and about four hundred towards the west, in the form of a rectangle: at the end of it are two batteries of cannon, and a high tower or light-house. In the middle of the mole is a small fort, and at the other end, next the land side, is a fortress, with four bastions; with the arsenal for the galleys, the magazines, and other store-houses. The port is safe and commodious every where, except on the south-west side, which is full of rocks, that rise no higher than the surface of the water, on which account ships enter it, near the head of the mole just opposite the city, where they have from eighteen to twenty-two fathoms water.

Trapani, the ancient Drepanum, stands on a peninsula on the west coast of the island of Sicily, about forty miles to the south-west of Palermo, and is still famous for its trade; for the number of nobles and gentry who live in the city and its neighbourhood; for the many trading vessels that sail to and from it; for its salt springs and works, and its having a good coral fishery. It is situated on a peninsula, forty-five miles to the south-west of Palermo, and is defended by a square castle. Its haven is large; but too much exposed to the south winds. At its entrance is the above castle seated on a rock, and which is surrounded with other works and batteries, and also by the sea. The town is encompassed by a plain wall. The hill at the foot of which it stands was antiently

called Eryx, and on the top was a temple of Venus and the tomb of Anchises.

Gergenti was antiently the greatest and richest city in the whole island: it stands about four miles from the sea, on the south-west coast, sixty-six miles to the south of Palermo. It rose out of the ruins of the antient Agrigentum, though it does not stand directly on the same spot. It is situated at the mouth of the river St. Blasio, upon a hill, and is defended by a castle so strong by nature, that there is no access to it but at one place. It is the see of a bishop, and is said to have been antiently ten miles in compass, and is famous for its tyrant Phalaris, who used to torture those who had displeased him in his brazen bull; but Perillus, the artist who had the cruelty to invent it, was, for his reward, condemned to have the first experiment tried upon himself. The adjacent territory is rich, and produces great quantities of corn, of which it carries on a considerable trade by means of the river and its port, which lies about five miles to the westward.

S E C T. X.

Of the Islands round Sicily; with a particular Description of Malta, and the Knights of that Island.

THE principal islands round Sicily are, first, the Liparean islands, called by the antients *Æoliæ* and *Vulcaniæ*; these lie towards the north of Sicily, and the nearest is about forty miles distant. The volcanoes that were in some of them, and still partly remain, have always contributed to the violent winds which continually reign in these parts; whence the antients said, that *Æolus*, the god of the winds, resided here, and accordingly called them by his name; and *Vulcan* being the tutelary god of such volcanos, they were also called *Vulcan's islands*. The most remarkable are the following:

Lipari, or Lipara, the largest and most populous of them, is computed to be about eighteen miles in circuit, including its capes and the windings of the coast, for it is of a very irregular figure. The climate is healthful, the air serene, and the soil rich and fertile. Besides corn, wine, and fruit, which grow in great plenty, the inhabitants send great quantities of figs and raisins into most parts of Europe. It likewise produces abundance of sulphur, allum, and naphthe; and has several warm baths, formerly much resorted to. The coasts yield great plenty and variety of fine fish. In this island were formerly pits emitting smoke and fire; but at present they have entirely ceased. In Lipari stands a town of the same name, built on a steep rock, with a castle, and is the see of a bishop.

Volcano, in Latin *Vulcania*, antiently also *Thermissa*, *Therassia*, and *Hiera*, or the Holy, is parted from Lipari by a narrow channel, and though not so large, rises much higher. On the north coast is a mountain whose top continually emits flames or smoke; but more furiously at some times than others.

Stromboli, antiently *Strongyle*, is of a round form, and situated on the north east coast of Lipari, about thirty miles from that island. It is computed to be about twelve miles round, but is wholly uninhabited, being properly nothing more than a burning mountain of an extraordinary height, that continually casts forth fire and smoke, which are seen at a great distance at sea.

Another cluster of small islands, named the *Ægates*, or *Ægades*, lie on the west coast of Sicily; these are *Levenzo*, the antient *Buccina*, or *Phorbantia*; *Favagnana*, the antient *Capraria*, or *Ægusa*, which is extremely fruitful; and *Maretamo*, the antient *Maritima*. These are very inconsiderable, we shall therefore proceed to one of much greater consequence.

The island of Malta, the antient *Melite*, is situated in the thirty-sixth degree of north latitude, and between the fourteenth and fifteenth of east longitude, sixty English miles to the south of the island of Sicily, and is commonly treated of under Italy, on account of its greater proximity to it, than to the coast of Africa. It was here that St. Paul was bit by a viper, after being wrecked on the coast. This island is computed to be

twenty miles in length, twelve in breadth, and near sixty in circumference. It was antiently little more than a barren rock, but such quantities of soil have been brought from Sicily, that it is now become a fertile island, though it produces no more corn than is barely sufficient to maintain the inhabitants six months in the year, and the rest they purchase cheap in Sicily. The wine produced in this island is also not sufficient for its consumption, and it is likewise deficient in wood. But, on the other hand, it has plenty of figs, melons, and other fine fruit; with honey, a great deal of cotton, good pastures, considerable fisheries, sea-salt, and a profitable coral-fishery; but the heat is excessive both day and night, and they have a great number of gnats, which are the plague of the country.

The annual revenues of this island are computed at seventy-six thousand scudi, and the number of its inhabitants amounts to about sixty thousand. The common people speak Arabic; but those in genteel circumstances the Italian.

The most antient inhabitants of Malta of whom we have any account, were the Phœacians, who were driven out by the Phœnicians, as they were by the Greeks. It seems afterwards to have been under the dominion of the Carthaginians, from whom it was taken by the Romans. Upon the declension of the Roman empire, it was first subdued by the Goths, then by the Saracens, from whom it was wrested by the Normans in 1090, after which it had the same masters as Sicily, till Charles V. gave it to the knights of St. John of Jerusalem.

These knights arose in the following manner: Several trading people of Amalfi, in the kingdom of Naples, had by their trade so ingratiated themselves with the Saracen princes, that they were permitted to build a church at Jerusalem, which was finished in 1248, and called St. Maria della Latini. As there was a great resort to the Holy Sepulchre, the above merchants built an hospital and oratory for the accommodation of pilgrims, which they dedicated to St. John the Baptist, and appointed certain monks to attend on the pilgrims, who from their office were stiled Hospitallers, and from the church of St. John, Johannites. At first they procured necessities from Amalfi, but after the conquest of Palestine, the fruit of those destructive croisades which desolated Europe, Godfrey of Bouillon endowed them with several lands; and his successor Baldwin having put them in possession of some castles and towns, they held a general chapter, and elected Raymund di Podio their master, who instituted an order out of the brotherhood, and made them take the vows of chastity, poverty, and obedience; gave them the octangular cross, and a black cloak, as the badge and habit of their order, and divided them into three classes, knights, Capellans, and Servanti d'Armi. This happened towards the close of the seventh century. The order was confirmed by the pope, and, notwithstanding their vow of poverty, they obtained considerable wealth. They maintained their ground in Syria and the Holy Land, against the continual assaults of the Turks, for two hundred years, till losing Acra, the last place they possessed, in 1191 they removed to the island of Cyprus, and in 1308 took the isle of Rhodes and the neighbouring islands, which they held for the space of two hundred and thirteen years, during which they were stiled knights of Rhodes; but Solymán II. having dispossessed them in 1528, after they had made a long and brave resistance, they first went to Candia, and afterwards separating, some went to Venice, and others to Viterbo and other places in Italy, especially to Nice in Savoy. But Charles V. apprehending that Solymán would on their account make a descent into Italy, sent them to Syracuse in Sicily; and, in 1529, conferred on them the islands of Malta and Gozo, and also committed to them the defence of Tripoli, which was then in his possession. From this period they obtained the name of knights of Malta.

The order consists of eight tongues, or nations, the principal of which are the French, Italian, Spanish, English, and German. In France are three tongues, namely, those of Provence, Auvergne, and France peculiarly so called. Spain is divided into those of Aragon and Castile, and with the German are united the

priory of Denmark, Sweden, and Hungary. Each of these countries has contributed to the advancement of the order, especially France, there being three hundred commanderies in that kingdom, which, if added to those of other countries, the whole number of knights may be computed to amount to three thousand: yet their losses by war, and more particularly by the Reformation, have been very considerable, the order being now destitute of the English, Danish, Swedish, and Hungarian priories; and they have also suffered greatly in Germany and the Netherlands.

The knights must be all noblemen, and produce proofs of an illustrious ancestry: such as have done this are stiled *cavalieri di giustizia*, in contradistinction to the *cavalieri di gratia*, who cannot sufficiently ascertain their descent, yet are made knights on account of their personal merits. According to the statutes, no natural children, except those of princes, nor persons under eighteen years of age, are admitted into the order. They engage to be at continual war with the Mahometans and all corsairs of that religion; and, as they have adopted St. Augustine's rule, are as a religious order subject to the pope. The grand master is stiled by foreign princes Most Eminent Highness, and is under the jurisdiction of no temporal power; but in what relates to the order he is accountable to his council and chapter: though with respect to the island and inhabitants, he is entirely absolute. His subjects stile him Most Serene Eminence; the knights and others only Eminence. When at home, he usually wears a long black gown, made after a particular fashion, with a large golden key of the Holy Sepulchre hanging by his side; but on a journey he dresses like a layman, and wears a sword.

Priories of the order are established throughout all the popish countries in Europe, of which the great priory of Germany, established at Heistersheim in Brissgaw, holds the first place. Its administrator has the dignity of a prince of the empire, with a seat and voice in the diet among the princely abbots; and he must annually remit to the grand master, whose vicar he is reputed to be, the necessary contributions for acting against the Mahometans, and the usual assessment payable by every commandery.

But to return to the island: the principal city is that of Valetta, so called from John de Valetta, the grand master, who laid the first stone, in the year 1566, on a hill which extends into the sea; and it has been since so strongly fortified, that few places exceed it in strength. Its walls are of large square stones, some dug out of the rock, and planted with several batteries. On the point towards the sea stands the castle of St. Elmo, which is fortified in the modern taste, and defends both harbours; one of which, called Marfa Muscietto, lies at the entrance from the sea to the right of the town, and incloses a small island, on which stand both a fort and a lazaretto. The other harbour on the left side is simply called Marfa, or the Great Harbour, being the largest, safest, and most commodious in the island. Its entrance, besides the castle of St. Elmo, is guarded by fort Ricafoli. From the port there is an ascent to the town, which is but small, tho' very beautiful. It has but two gates, one of which leads to the port, and the other to the country.

There are here several churches, among which that of St. John the Baptist is the principal. On one side of it is a fine square, with a fountain at each corner. It is a large building paved with beautiful marble, and within it are hung up a great number of flags taken from the Turks. They also pretend to have here many relics, and in particular St. John the Baptist's right-hand.

Among the several noble buildings in the city, is the palace of the grand master, in which is a magazine of arms for thirty-five or forty thousand men, which are kept very clean and in great order. Before this palace is a large square, in the midst of which is a noble fountain, that throws up great quantities of water to a considerable height, and even supplies the whole town. The palaces of the conservatory and treasury are also fine buildings, as are also the inns. The hospital is likewise well built, and the hall for the sick knights is hung with tapestry, where they are attended by knights, and served in plate. They are all under a vow of celibacy; and yet they make

no scruple of taking Grecian women for mistresses. Poor travellers find entertainment here, till they can get a passage to the place to which they are bound, and then they are furnished with provisions, and their charges paid through their voyage.

The Jesuits have a well built college; and there are also several convents and nunneries. Even the meanest houses make a good shew, they being all flat-roofed, and built of large square white stone, which retains its colour long, and seems always new. The streets, however, are incommodious, from their being always up and down hill, but they are wide and straight. The handsomest of these reaches from the castle of St. Elmo to the Royal Gate, which is almost a mile in length.

The adjacent country is full of gardens, and very agreeable places of pleasure. About twelve miles from the city the grand master has a palace built in the form of a castle, the halls of which are adorned with excellent paintings. It has very neat gardens filled with orange, citron, and olive trees, with several beautiful fountains; and at a small distance is a grove stocked with game for his diversion.

Citta Vittoriosa, or il Borg, a fortified town, stands on a narrow neck of land to the left of Valetta: on each

side a broad natural canal runs up into the land, and, surrounding the town, forms a fine harbour. On a high rock is the strong castle of St. Angelo, which has a communication with the town by a bridge. The inhabitants amount to about three thousand, and formerly the grand master resided here. The palace of the inquisition and the arsenal are reckoned among the principal buildings.

Malta, Medina, or Citta Vecchia, that is the Old Town, are different names for a fortified town that stands on a hill in the middle of the island, and was formerly above twice as large as it is at present. It is the residence of the bishop of this island, and has several churches and convents.

Five miles from Malta is the island of Gozo, which is twelve miles in length, and six in breadth. It enjoys a very wholesome air, and, though mountainous, is almost all cultivated; for the inhabitants delight more in tilling the land for corn, than in any other sort of husbandry; though it has many places well watered, and fit for gardening and pasture. It has some good harbours, defended by three forts, and the inhabitants amount to about three thousand.

C H A P. XXVI.

Of the Kingdom of SPAIN.

S E C T. I.

Its Names, Situation, Extent, Climate, and a particular Account of the Pyrenean and other Mountains; with the Minerals they contain. The Rivers, Vegetables, and Animals of the Country.

THIS country was formerly known by the name of Iberia and Hesperia, which, like that of Spain, is thought to be derived from three of its antient kings; but it has never yet been proved that these kings ever existed. It is not improbable, that the first people who came into this country seeing nothing beyond the ocean, which environed Spain on three sides, imagined themselves at the end of the world, and therefore assumed the name of Iberians, from a Phœnician word of that import; calling the country itself Iberia, and giving the name of Iberus to the largest river they met with. The Greeks called this country Hesperia, from its western situation; and to distinguish it from Italy, which had the same name, called it the Farther Hesperia. It was usually called by the Romans Hispania; but this is now altered by the inhabitants to Espana, which some derive from the Phœnician word Sepan, or Sepana, a rabbit, this country being formerly over-run with these animals. The French call this country Espagne, and we by contraction Spain.

This country, including Portugal, is the most western part of all the continent of Europe, and is a large peninsula encompassed on every side by the sea, except on that part which joins to France, from which it is separated by a continued range of mountains called the Pyrenees; on the east and south it is bounded by the Mediterranean, the straits of Gibraltar, and the Atlantic ocean; on the west by that ocean, and by Portugal, which extends along the coast a considerable distance; on the north by that part of the Atlantic ocean called the Bay of Biscay, and also by the Pyrenean mountains; extending between the thirty-sixth and forty-fourth degrees of north latitude, and between the tenth degree west and the third degree east longitude, that is, thirteen degrees from east to west, and eighteen from north to south. The whole circuit of Spain, in a continued direction from town to town, and from port to port, exclusive of the windings

of the creeks and bays, amounts to about six hundred leagues, or eighteen hundred miles, including Portugal, which was antiently a part of Spain.

In most of the provinces the air is pure and dry, but in June, July, and August, the days are extremely hot, especially in the middle of the country, yet in the night a traveller shivers with cold. Towards the north, and in the mountainous parts, the air is, as usual, cooler than in the south, and near the sea contracts a moisture. It seldom rains, and the winter frosts are never so severe as to bind up the ground. The want of temperature in the heat, and the coolness of the night, is the reason that seed lies a long time in the ground before it shoots up; sometimes indeed a cool breeze, by the Spaniards called a gallego, issues from the mountains of Galicia; and this, without great precaution, occasions violent, and sometimes fatal colds.

Among the many mountains in Spain, the Pyrenees are the most remarkable. These separate Spain from France, and extend from the Mediterranean to the Atlantic ocean, which is about two hundred and twelve miles, and in some places are above an hundred miles in breadth. They begin at Vendres, a sea-port in the province of Roussillon in France, and extend to Fuentarabia, but under different names. Near Roussillon they divide themselves into two branches; that which separates the country from Languedoc is called Antipyrænee; the other, between it and Catalonia, is termed Col de Pertuis: between Gascony and Amazon lie the mountains of Jaca and St. Christine, and the famous Pic de Midi, which resembles a sugar-loaf standing on a table, and is of a prodigious height. In Navarre, between Pampelona and St. Jean de Pie de Port, are the mountains of Adula and Roncevaux. Over these mountains there are only five passages out of Spain into France, and even these are narrow; one of them leads from St. Sebastian's in Guipuscoa, to St. Jean de Luz; the second from Maya in Navarre to Annoa; the third from Taraffa in Navarre to Pie de Port; the fourth through the county of Comminges in Arragon; and the fifth leads from Catalonia to Languedoc.

The very valleys between the mountains are covered with thick and lofty woods. The other mountains of

Spain.

Spain are Sierra d'Occa, or mount Idubeda, which is a chain extending from the Pyrenees to Tortosa. At the beginning it forms an arm traversing all Spain from east to west, as far as Cape Finisterre. To the south, below mount Cayo, another branch, called Orospeña, rises gradually, and near the source of the Tagus takes the name of Sierra Molina, which, farther south, it changes for that of Sierra d'Alcaraz.

Here the chain turns off to the south-west, separating the kingdom of Granada, and extending to the Straights of Gibraltar.

According to ancient writers, the mountains of Spain are very rich in gold and silver; but the Spaniards choose rather to import these metals from America than to have the trouble of searching for them in their own country; but the iron mines are worked here with great skill. Spain has also other minerals, as lead, tin, cinnabar, quicksilver, alum, vitriol, copperas, lapis calaminaris, and likewise crystal, amethysts, and other gems.

The great and small rivers in Spain are said to amount to an hundred and fifty; the principal of these are the Minho, which rises in Galicia; the Douro, which has its source in Old Castile, in a part of the mountains of Idubeda; the Tagus rises in a mountain in New Castile; the Guadiana also issues from New Castile, deriving its source from some lakes, at a small distance from which it takes its course between high mountains, and thus conceals itself for near three miles, till it shews itself again in some fens, but soon hides itself again amidst reeds and rocks, which probably gave occasion to the mistake of losing itself under-ground. The Guadalquivir, or Great River, receives its course in Andalusia, where several small streams issuing from mount Segura unite in a lake, from whence this river flows. From Corduba to Seville, it is passable only by small craft; but from the last city to its mouth it is navigable by ships of burthen, though dangerous on account of its many sand-banks. The Ebro rises in the mountains of Santillane, in Old Castile, from two springs, and receives upwards of thirty brooks in its course, becoming navigable near Tudela: its navigation, however, is dangerous, on account of its many rocks: at length it discharges itself with great rapidity into the Mediterranean, and its mouth forms the little island of Alfacqs.

The country in general labours under a great scarcity of corn, which is principally owing to the neglect of agriculture; for though the soil be in many places extremely dry, and the growth of vegetables obstructed in the day-time by the excessive heats, and by the intense cold of the nights, yet it appears from history, that Spain formerly enjoyed great plenty of corn. It however abounds in the most delicious fruits, as figs, grapes, oranges, lemons, pomegranates, pears, peaches, almonds, chestnuts, common nuts, &c. and also produces very good saffron. The Spanish wines, particularly sack, are eagerly bought up by foreign nations; and the value of the wines and raisins annually exported out of the country about Malaga alone, amounts to a million and an half of piastres, an imaginary coin of about three shillings and seven pence value.

Several parts of the country also produce sugar canes. Spain likewise enjoys great plenty of exquisite honey, and silk in abundance; but little flax and hemp. Salt is exported in considerable quantities, a great deal of sea-salt being made in the maritime parts of Andalusia, Catalonia, and Valencia, where the sun serves instead of fire. A prodigious quantity of pot-ash is also exported from Spain.

In this country are also innumerable flocks of fine sheep, part of which, during winter, feed in the plains, and in summer are driven up into the mountains; and from these are produced the best wool: others are always kept in one place. The number of shepherds in Spain has been computed at forty thousand. The best wool is that of Old Castile, though the Spanish wool is, in general, extremely fine and valuable. Andalusia and Asturia are particularly famous for their fine horses. There are here also a great number of large and handsome mules, some of which are seventeen hands high, and carry very heavy burdens; but Spain has few horned

cattle. In Andalusia are caught the wild bulls for the bull-fights.

The maritime parts of the country, particularly those of Galicia and Andalusia, abound in fish, and, among others, in sturgeon, tunny, salmon, haddock, lampreys, &c. but for want of a proper improvement of the fishery, Spain, according to Ustariz, annually purchases salt-fish from foreigners to the amount of above three millions of piastres.

S E C T. II.

The Manners and Customs of the Spaniards, the Reason why Spain is thinly inhabited, and of their Poverty, notwithstanding the immense Quantity of Gold and Silver sent from America. Their Language, Religion, and the Inconveniences suffered by Travellers.

THE Spaniards are grave and solemn in their behaviour, and are not always dressed in a short cloak and coat, nor do they always appear abroad with a long sword, curled whiskers, and a pair of spectacles on the nose. They are remarkable for frugality, love of pomp, fidelity, valour, intrepidity, and abhorrence of drunkenness; they are very jealous of their honour, when once engaged; and the baron de Montesquieu observes, in his Spirit of Laws, that "The Spaniards have been in all ages famous for their honesty. Justinian mentions their fidelity in keeping whatever was entrusted to their care; they have frequently suffered death rather than reveal a secret. They have still the same fidelity for which they were formerly distinguished. All the nations who trade to Cadiz trust their fortunes to the Spaniards, and have never yet repented it."

On the other hand, they are universally too much given to women, and their jealousy, where either their wife, daughter, sister, or even mistress, is concerned, seldom fails to end in bloodshed; for they think no means too cruel, base, or unjust, to wipe off any stain that is cast upon their honour, or to gratify their revenge. Pride of birth is no where carried to a greater height; and the insinuation that a man is descended from the Moors, is sufficient to make him stab the slanderer, or procure his being privately assassinated. In short, they have a mixture of the most amiable virtues and the most shocking vices; and while they affect a haughty air to those with whom they are unacquainted, no people in the world are more courteous to those with whom they are intimate.

As to their food, they are very moderate in their eating, and can make a meal of olives, a salad, a little garlic, or a few roots; but persons of fortune have several expensive dishes. The men dine by themselves, and their wives and children eat together.

The women are generally very lean, and very amorous; they have black eyes, flat bosoms, small feet, and long garments. They sit cross-legged on carpets, a custom which they derived from the Moors. They are much addicted to painting, though they are kept very much at home by the jealousy of their husbands.

The kingdom of Spain is said to contain about seven millions and a half of inhabitants; but it would support more than twice that number, was it properly cultivated. It is said, in the times of the Goths and the Moors, it contained between twenty and thirty millions of people, and might yet be very powerful, if it had no possessions in America; but now it is thinly inhabited. The usual reason assigned for this is, first, the expulsion of the Moors; for when Ferdinand the Pious took Seville from them, in 1248, the several districts of this kingdom contained a hundred thousand populous towns and villages; and when Ferdinand the Catholic reduced the kingdom of Granada, it consisted of fifty fortified towns, besides an infinite number of smaller places, the greatest part of which were afterwards demolished. Another grand cause of the want of inhabitants is the decay of arts and manufactures which formerly flourished here, and the heavy taxes by which the people are oppressed. But perhaps the greatest enemy to the populousness of the country are the convents, by which no less than two hundred thousand persons are restrained from propagating their species:

species: for if a family have more than one or two sons, the eldest must at any rate be gentlemen, and the rest monks. The way of living among the Spaniards, particularly in their eating and drinking, also contributes to render them unfruitful; for in the use of spices, particularly of pepper, they know no bounds. Their wines are also strong and inflammatory; and yet, after a meal, they add to these a very fiery sort of brandy. On the other hand, they are no less immoderate in the use of cooling foods and drinks, and the conflict of such discordant qualities must necessarily produce great disorders in the body. Leanness is here so general, that a fleshy corpulent man is hardly to be met with; and there are few or no countries where loss of sight is so common.

Small as the number of inhabitants are, yet their poverty is remarkable, tho' they not only live in a country capable of supporting many millions more than they, in the greatest plenty, and have prodigious sums poured in from America. Savala computes that, from the year 1492, when America was discovered, to 1731, above six thousand millions of pieces of eight in registered gold and silver have been imported into Spain, exclusive of far greater sums unregistered, besides those received by foreign merchants from the Spanish dominions in America. It even appears that, one year with another, Spain receives from her American colonies above twenty-six millions of pezos, or pieces of eight: yet Ustariz computes, that all the coined and wrought gold and silver in Spain, including that belonging to churches and private persons, scarcely amounts to one hundred millions of piastres.

The two principal causes of this poverty are the want of industry in the Spaniards in agriculture, handicrafts, and manufactures, which occasion the country to be annually drained of many millions for corn and foreign goods. The second is, the insatiable avarice of the clergy, who practise a thousand arts to obtain the possession of the wealth of the country. To them not only belong most of the towns and estates, and these like their persons are exempt from all public taxes, but they also turn both the living and the dead to their profit; while the laity of all ranks implicitly comply with all their sordid views. The Mendicant friars, who have divided all families among themselves, tax every one according to their condition; and when they knock at a door there is no refusing them, though they scarce condescend to return thanks for what they receive. All wills are drawn up by them, and that commonly when the testator is near the last gasp, by which means they often impoverish widows and children, by assigning in the will the rightful inheritance to what they unjustly call pious uses. Few marriages are made without their negotiation; and as by this means they become father confessors, they are the despotic lords of the whole family; the cash, the manner of living, the equipage, children, and servants, are all subject to their controul. Their commerce, which is free from all duties and payments, and carried on partly by privilege and partly clandestinely, is likewise a rich fund to them, especially if considered with respect to their astonishing failures, without paying a shilling, and their selling the sanction of their names to cover the merchandize of others; an abuse which the government has in vain endeavoured to suppress.

The language used in most of the provinces is that which they call Castellano, and Espannol, or Spanish, which has the nearest affinity to the Latin, both in the words and composition, of any language in Europe: but in Catalonia and Valentia the common people use a dialect of the old French, or rather Gascon; but so mixed and corrupt, that it is not understood by any other provinces.

The popish religion is practised in Spain with the greatest scrupulosity and pomp. In no country is there more praying and ceremony, and less real christianity. The Virgin Mary is more respected and adored among the Spaniards than God himself, as appears even from their compliments: the expression of God be with you, the usual compliment at parting, does not convey the same mark of affection as that of the Virgin be with you, which they imagine expresses a much warmer cordiality. Thus swearing by the Supreme Being is esteemed a trifle, but by the Virgin is considered as the height of impiety. The

Spaniards are indeed mere slaves to the clergy, who so artfully hoodwink them that they do not perceive the chains of their slavery, or if they perceive them bear them willingly; and, when they galling them, dare not so much as vent a sigh after freedom. Under any disappointment, either of views of avarice or ambition, the clergy have their dreadful inquisition at hand, which seizes both on honour and life; so that persons of the most unspotted innocence esteem it a particular favour to come off only with the loss of their fortunes. In order to be taken up for a Jew or Mahometan, and consequently to be stripped not only of all one has, but to be burnt alive, it is sufficient for a person not to love pork, and not to have worked on Friday or Saturday, though the informer be only some menial servant, most of whom are spies to the inquisition, and betrayers of the families in which they live.

The court of inquisition was first introduced in 1478, by king Ferdinand the Catholic, and queen Isabella, at the suggestions of John de Torquemada, a Dominican, who was the first inquisitor. At Madrid it consists of an inquisitor general and six counsellors, one of whom is always a Dominican, two judges, one fiscal, and several other officers and assistants. The number of the families who are dispersed all over Spain, as spies and informers, are computed at about twenty thousand. Under this supreme court are others in the principal cities in the kingdom, and even in the Canary islands, Mexico, Carthagen, and Lima. But the Rev. Mr. Clarke observes, that the power of this tribunal is now declining very visibly, and seems hastening to its fall; for the present king of Spain has taken a bolder step to humble the inquisition than any of the Philips or Charleses who went before him. The inquisitor-general having thought proper to publish a liturgy which the king had licensed without consulting his majesty, the king, with a very proper spirit, put the inquisitor under an arrest, and immediately sent him guarded with a file of grenadiers into exile in a convent at a great distance from Madrid. So determined and resolute a measure as this alarmed the whole body of the clergy; they moved heaven and earth to obtain the inquisitor's recall; but for some time the king remained inflexible. The common people were now taught by the priests to say that his catholic majesty was no good catholic in his heart. At length, however, the king restored the inquisitor to his liberty; but in such a manner, as that prelate had no reason to triumph; for at the time of releasing him his majesty published a very spirited edict, which was dated on the twenty-seventh of November, 1761, by which he greatly limited their power.

Amidst the great decrease of the inhabitants in Spain, the body of the clergy have suffered no diminution; but has rather been gradually increasing, insomuch that Ustariz computes the number of ecclesiastics and their servants at two hundred and fifty thousand. The king nominates all bishops and archbishops, who are afterwards confirmed by the pope. In 1753 an agreement was entered into between the king and the pope, wherein the latter ceded to the former the nomination to all small benefices; which has not only considerably strengthened the king's power over the clergy, but also keeps those vast sums of money in the country, which used to be expended in journies to Rome, for the soliciting of benefices. The king can also tax the ecclesiastical possessions according to his pleasure. However, the power of the pope and his nuncio is still very extensive here, though no bull can be published without a written permission from the king.

One of the greatest inconveniences a stranger finds in this country is, the miserable accommodations to be met with on the public roads. The Rev. Mr. Clarke says, you must absolutely carry your provisions and bedding along with you, and even then, unless you can bear fatigue well, lie down in your cloaths, eat eggs, onions, and cheese; unless you can sleep whilst your mules rest, rise the moment you are called, and set out early in the morning before the heat comes on, you will fare ill as a traveller. It is a good method to carry dried tongues with you, hard eggs, some portable soup, tea, sugar, and spirituous liquors, not forgetting even pepper and salt; and
whenever

whenever you meet with good bread, meat, fowls, and wine, always to buy them whether you want them or not, because you know not what to-morrow may produce. A knife, fork, and spoon, are absolutely necessary, for you will find none; nor should you omit a pair of snuffers, a candlestick, and some wax candles; but great care must be taken to carry neither tobacco nor rum, for they are contraband, and may occasion the detention, if not the seizure of your baggage. You should also have as few books as possible, for the inquisition will seize them.

SECT. III.

Of the Diversions of the Spaniards; particularly of their Bull-Feasts, Plays, and other Amusements.

WE shall begin our account with the diversions and pastimes of the Spaniards, with a description of the bull-feast exhibited in the Plaza Mayor at Madrid, upon occasion of his catholic majesty's public entry into his capital, on the fifteenth of July, 1760, which we shall give from the account published by the Rev. Mr. Clarke. The square, which is large, was thronged with people, and all the balconies ornamented with different coloured silks, and crowded from the top to the bottom of the houses; the avenues to the square were built up into balconies, and a sloping scaffold placed round for the common people, and raised about eight or nine feet from the ground.

First came the coaches of the cavaliers, four in number, of a singular make, with glasses at the ends, and quite open at the sides: the cavaliers were placed at the doors of their coaches, from whence they bowed to the people in the balconies as they passed round the square, and were accompanied by their sponsors, the dukes of Ossuna, Banos, Arcos, and Medina Cæli. Before the royal family came a company of halberdiers, followed by seven or eight of the king's coaches, preceding his coach of state, which was extremely rich, with red and gold ornaments, and beautiful painted pannels. Then came a coach with some of the great officers; and next came the king and queen in a very sumptuous coach of blue, with all the ornaments of massive silver, and a crown at the top: the trappings of the horses were likewise silver, with large white plumes. These were followed by the coaches of the prince of Asturias, the two infantas, and Don Lewis, with their attendants.

Their majesties seated themselves opposite to the balcony of the English ambassador, in which was our author, in a gilt balcony, with a canopy and curtains of scarlet and gold. On the right hand of the king's balcony were placed the rest of the royal family, and on the left the gentlemen of the bed-chamber in a row, all dressed in a very fine uniform of blue and red, richly embroidered with gold. The halberdiers marched from the king's balcony, which was in the center of one side, and forming themselves into two lines fronting different ways, cleared the square of the crowd, who retired into the scaffolds erected for them; after which the halberdiers formed themselves into a line before the scaffold under the king's balcony. Then two companies of boys, dressed in an uniform, with caps and red taffety jackets, came with buckets of water in their hands and watered the stage as they crossed over it to the opposite side: the six chief alguazils of the city now came mounted on fine horses, covered with trappings, and dressed in the old Spanish habit, black, with slashed sleeves; great white flowing wigs, and hats with plumes of different coloured feathers, advanced towards the king's balcony, under which they were obliged to stay the whole time to receive his orders, except when they were frightened away by the bulls.

At length the troops belonging to the cavaliers ascended the stage in four large companies dressed in silk Moorish liveries, richly and elegantly ornamented with lace and embroidery: these first bowed to the king's balcony, and then went in procession round the square; and from the elegant singularity and variety of their uniforms appeared extremely beautiful. After them came the four knights

in the old Spanish dress, with plumes in their hats, mounted on fine horses: each held in his hand a slender lance, and was attended by two men on foot dressed in light silk of the colour of his livery, with cloaks of the same; these never forsake his side, and are his principal defence. The cavaliers then dispose themselves for the encounter, the first placing himself opposite to the door of the place where the bulls are kept, and the other at some distance behind him.

At a signal given by the king the doors opened, and the bull appeared, to the sound of martial music; and the loud acclamations of the people, when seeing one of the attendants of the first cavalier spreading his cloak before him, he aimed directly at him; but the man easily avoided him, and gave his master an opportunity of breaking his spear in the bull's neck. In the same manner the bull was tempted to engage the other cavaliers, and always with the same success, till having received the wounds with their lances, he was encountered by the other men on foot, who, after playing with him with incredible agility as long as they thought proper, easily put an end to him by thrusting a sword either into his neck or side, which brings him to the ground, and then they finish him at once, by striking a dagger, or sword, behind his horns into the spine, which is always immediate death. After this the bull is hurried off by mules finely adorned with trappings.

After the knights were sufficiently tired with these exploits, the king gave them leave to retire; bulls were then let out, one at a time, from another door; these were of a more furious nature, and were encountered entirely by men on foot, who were so far from fearing their rage, that they strove to increase it; by darting at their necks, and other parts, little barbed darts ornamented with bunches of paper, some of which were filled with gun-powder, and were no sooner fastened to the bull than they went off like a serpent. Nothing can be imagined more tormenting than these darts, but the amazing dexterity with which they are thrown, takes off the attention from its cruelty. They also dress up goats skins, blown up with wind, and increase the fury of the bull by placing them before him, which makes a very ridiculous part of the entertainment. Many of the bulls, however, would not attack them; and one of the most furious that did, shewed more fear than in encountering his most sturdy antagonist. They also baited one bull with dogs, which shewed as much courage as any of the bull-dogs in England.

My apprehensions, says our author, were at first principally excited for the men on foot; but the knights are in much more danger, their horses being too full of fire to be exactly governed; they cannot therefore so well avoid the aim, and are liable to be every moment overthrown with their horses, if their attendants by their side do not assist them. Two beautiful horses were nevertheless gored; one of which was overthrown with his rider, but fortunately the man escaped any mischief from his fall. The courage of these horses is so great, that they have been often known to advance towards the bull, when their bowels were trailing on the ground.

This spectacle, he adds, is one of the finest in the world, whether it be considered merely with respect to the splendor of the sight, or as an exertion of the amazing agility and dexterity of the performers. The Spaniards are so devoted to it, that even the women would pawn their last rag to see it. Nothing can be imagined more crowded than the houses even to the tops of the tiles, and dearly enough do they pay for their pleasure, pent together in the hottest sun, and with the most suffocating heat that can be endured. This is certainly a remnant of Moorish, and perhaps Roman barbarity, and will not bear the speculations of the closet, or the compassionate feelings of the tender heart; but, on the other hand, it has all the good effects of chivalry, in exciting in the minds of the spectators a disposition to hardy actions, without the horror that prevailed in former times, of distinguishing bravery to the prejudice of our own species. It teaches to despise danger, and that the surest way to overcome it is to look it calmly and stedfastly in the face, and to afford a faithful and generous assistance to those engaged with us in enterprizes of difficulty.

The

The bull-feast in the Plaza Mayor is never exhibited but upon some extraordinary occasion, as the accession or marriage of their kings, and is attended with very great expence, both to his majesty and the city. But there is a theatre built without the walls, where there are bull-feasts every fortnight, which to connoisseurs are greatly preferable to the others, the bulls being more furious, and the danger greater to those who fight them; but there is little difference in their manner of engaging them.

We shall now give some idea of the Spanish theatre, which our author visited at the season for acting the autos, or plays, in support of the catholic faith. The theatre made a good appearance with respect to its size and shape; but was rather dirty and ill lighted, and, what was worse, had an equal mixture of day-light and candles. The prompter's head appeared through a little trap-door, above the level of the stage; and he read the play loud enough to be heard by the people in the boxes. The pit made a motley appearance, many standing in their night-caps and cloaks; while officers and soldiers were interspersed among the dirtiest mob. The side and front boxes were filled by persons well dressed, and that which answered to our two shilling gallery was filled with women, all in the same uniform, a dark petticoat, and a white woollen veil. The actors were dressed in richer cloaths than those in England, and these they are perpetually changing, in order to shew the expensive variety of their wardrobe.

After some tedious and insipid scenes, came on an interlude of humour. One of the comedians addressed a lady who sung very prettily, and offered her a purse of money: in the mean while a man brought in three barber's blocks which he placed upon the stage, which he first dressed in mens cloaths; but then undressing them, dressed them in womens apparel, after which came in three men who had a fancy to tempt these three ladies; but they were inflexibly coy, and it was not long before their gallants discovered their mistake. At length, after some long tiresome uninteresting scenes full of fustian and bombast, an actor, dressed in a long purple robe, in the character of Christ, preached to the four quarters of the world in their proper dresses; Europe and America heard him gladly, but Asia and Africa remained incorrigible. Our Saviour was soon after blind-folded, buffeted, spit upon, bound, scourged, crowned with thorns, and compelled to bear his cross; when he kneeled down and cried, *Padre mi! Padre mi!* "Father, father, why hast thou forsaken me?" After this the fellow placed himself against the wall, with his hands extended, as if on the cross, and there imitated the expiring agonies of the blessed Saviour; after which one of the actresses unbound him, took off his crown and scarlet robes, and he having put on his wig and coat, joined the rest of the actors in a dance. After this one of the actresses, in a very long speech, explained the nature, end, and design of the sacraments; and the play was concluded by Christ appearing in a ship triumphant.

Soon after our author went to see a regular comedy, and there were two other English gentlemen in the same box with him. They understood very little of the design of the first act; they saw a king, a queen, an enchantress, and many other pretty delightful sights; but the interlude with which it was concluded was extremely low. The scene was intended for the inside of a Spanish inn, during the night: there were three feather-beds, and as many blankets brought upon the stage; the queen and her maids of honour personated the mistress of the inn and her maids; and accordingly fell to making the beds. After this six men came in to lie there, and one of them being a miser had rolled up his money in twenty or thirty pieces of paper. They then undressed before the ladies by pulling off six or seven pair of breeches, and as many coats and waistcoats, and got into bed two by two: when behold, the jest consisted in seeing them kick the cloaths off one another, and then fight, as the spectator is to suppose, in the dark. "The absurdity of this scene, and the incomprehensible ridiculousness of it," made us, says our author, laugh immoderately. The sight of the feather-beds, the men kicking and sprawling, the peals of applause that echoed through the

house, were truly inconceivable; though, I believe, our neighbours in the next box thought we laughed at the wit and humour of the author. It was a scene that beggars all possible description, and I defy any theatre in Europe, but that of Madrid, to produce such another."

When this interlude was finished, there succeeded some other scenes between the king, queen, enchantress, and the rest of the actors. Five or six of them all at once drew their swords upon the enchantress, who parried them with her wand, and, to their great amazement, retired unhurt into her cell. At other times the enchantress killed with a look, and restored to life with a second. In short, after several ridiculous incidents, the enchantress renounces the devil and all his works, and in the conclusion embraces the catholic faith, and declares she will adhere to that alone. But it can hardly be supposed, that these absurd dramatic pieces are the best of the kind; and indeed they are said to have some that are excellent, as those of Lopez de Vega, which come nearest to our Shakespeare.

The taste for gallantry and dancing prevails in Spain universally, and they are the two ruling passions of the country. The latter is so much their favourite entertainment, that their greatest matrons never think themselves excluded by age from this diversion; and you may see the grand-mother, mother, and daughter, all joining in the same dance. The two most favourite and universal Spanish dances are the *seguedillas* and the *sandango*: the first is something like our *hay*; the second is a very antient dance, and though originally Roman, yet the Spaniards have mixed somewhat of the Moorish along with it: they are excessively fond of it, and it is danced by the first nobility, as well as by the common people.

The military turn of the Spaniards appears in many of their diversions, and even in the very terms and language they use at cards: *hombre* in Spanish signifies a man, and from thence we derive our game at ombre: the four principal cards are called *matadores*, or murderers, because they win all others. *Spadillo* is the little sword, or, as we call it, the ace of spades; for *spado*, in Spanish, signifies a sword, and they are so painted on their cards.

It is usual with the Spaniards both to breakfast and sup in bed; their breakfast is usually of chocolate, tea being seldom drank by them. Their dinner is generally a *pochero*, or beef, veal, mutton, pork, bacon and greens, &c. all boiled together. If it be a richer or more expensive mixture of meats and delicacies, it is then termed an *olla podrida*, or what we call an *olio*. They are fond of garlic; and it is a proverb among them, that olives, salad, and radishes, are food for gentlemen.

The Spaniards generally sleep after dinner.

Though the men and women all wear the same dress in the street and at mass, yet the ladies in their private visits wear as great a variety of dress, and of a much richer sort than those in England. The spirit of jealousy is so far worn out, that the married ladies of Madrid have each their professed lover, just as the Italian ladies have their *cicisbeo*.

Their evening's airing is to the last degree insipid: you see nothing but a string of coaches following one another, filled with people of fashion: here a duke and his confessor; there a couple of smart young abbés; here a whole family grouped together, husband, wife, and children. When they take their airing on gala, or court days, all their footmen are dressed in laced liveries, with plumes of feathers in their hats.

The number of servants kept by the grandees, and people of the first fashion, is immoderate. Some of them have three or four hundred domestics, and the English ambassador, in compliance with the taste of the country, keeps near a hundred. As their coaches are usually drove with four mules, they have two postillions; with generally four and sometimes six footmen behind their coaches. In the hot weather they take out the sides and backs of their coaches, for the sake of the air.

They seldom use sedans; and when they do, they have always two footmen who go on each side the hindmost chairman, in order to hold him up, lest he should fall: there

there are two on each side of the sedan, and two who follow behind with lanthorns, though it be in the middle of the day. Thus they have generally nine servants with a coach, and ten with a sedan, besides those who go before.

S E C T. IV.

Of the Capacities and Genius of the Spaniards; the Obstructions to Learning, and their Skill in Divinity, History, Physic, and Poetry. Their Deficiency in manual Arts. The State of their foreign Trade; with a particular Account of the Spanish Coin, Weights, and Measures.

THE Spaniards are far from being wanting in capacity for the sciences, yet little progress can be expected from them while they are debarred the use of their natural talents. The clergy not being very learned themselves, it is a point of policy with them to suppress all scientific knowledge among the laity; and in order to keep them in ignorance and subjection, they brand all literary researches with the name of heresy. Hence, tho' Spain has no less than twenty-two universities, and several academies, among which is one at Valladolid for geography; yet are they under such restrictions, that those who attend them can never make any figure in literature. The booksellers in Spain scarcely dare to keep a valuable book in their shops, on any remarkable and interesting subject; the inquisition being extremely vigilant in suppressing them, and concealing from the public whatever may tend to open their eyes. They have pretences always ready for seizing foreign books, though they have not the least relation to religion. Indeed, most of the books published in the Spanish language are printed out of Spain, few printing-houses being to be seen there, and the far greatest part of their paper is imported from Genoa.

With respect to the present state of divinity, it consists, much as it formerly did, in the study of the fathers, councils and decrees of the popes and their canons, and in systems of Thomastic and Augustine theology. The knowledge of the learned languages, and explication of the text of the sacred writings, have little to do with it. In this tract of criticism they are almost utter strangers, though they are well versed in casuistry, which makes a constant part of the studies preparatory to the pastoral office.

In history the Spaniards have had many valuable writers; but it is dangerous to descend too near to the present time; besides, his present majesty has absolutely forbid any of his subjects to write the history of Charles V.

In physic and surgery, Mr. Clarke says, they are at least two centuries behind the English; but where the people are persuaded that saints, miracles, and charms can be procured to cure the most inveterate diseases, there must be little inclination to have recourse to art. However, they still practise copious bleeding in most diseases, and botany is much studied.

In poetry they have many writers, besides the celebrated Lopez de Vega, who wrote the *Jerusalem Conquistada*, tragedies, comedies, &c. Their songs have a wonderful air of simplicity, and in some of them are much sentiment as well as dignity: those upon love are extremely chaste; and some have a pleasing air of romance; but moral, grave, majestic, pensive, like the people themselves.

The most celebrated writers of humour in prose are Cervantes and Guevara; the most famous work of the latter is the *El Diablo Coxuelo*, which la Sage modernized into a romance, known in English by the title of *The Devil on two Sticks*.

There is here a want even of the most necessary trades; and of the few they have, the greatest part are in the hands of the French, who are very numerous in this country; for the natives, besides their aversion to work, disdain to stoop to laborious employments. They are not, however, entirely without manufactures, especially of silk and wool; but these fall far short of that flourishing condition to which they might be brought: and as tradesmen and merchants are looked upon with contempt, they have no sooner amassed a competent fortune, than

they leave off trade, procure a title, and set up for persons of quality. The great duties likewise on Spanish stuffs render them dearer than the foreign. Thus the Spaniards part with the products of their own country, and with the treasures of America, to foreigners, who supply them with bread, and every thing that can contribute to convenience and splendor. It has indeed been said, that of late the Spanish manufactures are in a thriving way, and that they make very fine cloths, besides gold and silver; but this will not probably be lasting; at least it will be a long time before they are able to supply the wants of their own country, so as to exclude foreign manufactures.

Spain is extremely well situated for trade and navigation: they might be their own carriers; but this advantage they neglect, and leave it to other maritime nations, who turn it to a very good account. The Spaniards indeed deny them all access to their possessions in America, and are so jealous of having that trade confined only to themselves, that no foreign ships must even approach their coast: yet of this commerce, which is carried on in their own ships, they have the least profit, they being little more than factors for the French, English, Dutch, and Italians, who send their goods to America by them, and have the greatest share in their returns of gold, silver, and other commodities.

The trade to America was formerly carried on by the flota and galleons. The flota, or Plate fleet, consists of a certain number of ships, some belonging to the king, and others to merchants: these used to set sail from Cadiz to Mexico about August, unloading at Vera Cruz, and returning to Spain in eighteen or nineteen months.

The galleons were two men of war, called Capitana and Almiranta, which served as convoy for eight or twelve ships that put to sea from Cadiz every March or April. Their first port was Carthagená; from thence, by way of the Havannah, they returned to Spain. But since the years 1735 and 1737, the flota and galleons have been discontinued, and the trade to America carried on in register ships, which any merchants may send, on obtaining permission from the council of the Indies. These sail from Cadiz directly to Lima, Buenos Ayres, Maracaibo, Carthagená, Honduras, Campeche, and Vera Cruz.

In 1728 an exclusive charter was granted to a company for trading to the Caraccas, a permission to the inhabitants of the Canary islands only excepted, who were allowed to send thither annually one register ship, whose cargo was entirely to consist of the produce of these islands. In 1756 another company was erected for trading to Hispaniola and Porto Rica, and sending annually ten register ships to the bay of Honduras, and the ports of the province of Guatemala.

The Spaniards also carry on a very considerable trade to the coasts on the South Sea, between the town of Manila, in the island of Luconia, and the harbour of Acapulco on the coast of Mexico; but of this trade we have given a particular account in treating of Manila, Vol. I. page 102, 103.

With respect to the Spanish money, it is not easily understood; for the Spaniards make up most of their accounts, and form their calculations chiefly in these two species, the real de vellon, and the maravedi. The latter is the lowest of the denominations of their copper money, and in this the king's accounts are kept; consequently the revenues of Spain, and the wealth brought from Peru and Mexico, are annually computed by an integer of copper that is three times less than our farthing.

The real de vellon is the smallest piece of their silver money, and equals our two-pence half-penny, and two-thirds of a farthing. But though it be the most usual way in Spain to compute by the maravedi and the real de vellon, yet there are several other methods of calculation still in force. Thus, pensions from the court, payments of the army, navy, &c. are set down in the register of the Spanish finances in escudos and ducados, or copper crowns and ducats. Some accounts of merchants and private persons are likewise kept in this way; but few things are bought and sold but by the former computation of maravedis and reals.

In the office of decimal rents, or tythes belonging to the archbishop of Toledo, accounts are kept in the obsolete denomination of dineros, ten of which make a maravedi. There are no less than fifty clerks in this office; and how voluminous must their accounts be for above thirty thousand pounds a year, that are kept in a denomination, the value of which is above thirty times less than an English farthing!

The small denominations by which the Spaniards love to compute, renders their accounts, like themselves, slow, tedious, and elaborate; but then they have this advantage, that they make their accountants most minutely exact.

But our English merchants traffic chiefly in pieces of eight, and compute usually by the piastre, or old disused piece of eight, consisting of fifteen reals and two maravedis: or if they reckon by pistoles, they mean the pistole of sixty reals, which is the common pistole, and not the gold one of seventy-five and ten maravedis, otherwise called the *doblon efectivo de oro*.

To give a more perfect idea of the Spanish coin, the following is reduced to the English weights and value:

	£.	s.	d.
The old Spanish pistole, 4 pen. wt. 8 gr.	0	17	4
The new Seville pistole, 4 pen. wt. 8 gr.	0	17	4
The old double doubloon, 17 pen. wt. 8 gr.	3	9	4
The old double pistole, 8 pen. wt. 16 gr.	1	14	8
The new Seville double pistole, 18 pen. wt. 16 gr.	1	14	8

The half and quarter of these in proportion.

The piastre of Spain, or Seville pieces of eight	0	4	6
The new Seville piece of eight	—	—	0 3 7
The Mexico piece of eight	—	—	0 4 5
The pillar piece of eight	—	—	0 4 5
The rial, or bit	—	—	0 0 7

The Spanish weights are the arroba, which is exactly twenty-five pounds English weight, four of which make a quintal or hundred: but yet the arroba is not the same throughout all Spain; for the pound of Cadiz and Seville, and consequently the arroba, are much larger than those of Castile.

In Spain almost every thing, whether dry or liquid, is sold by the averdupois pound of sixteen ounces, and consequently by the arroba: thus wine, oil, wood, coals, corn, bread, salt, &c. are sold by the pound, and in large quantities by the arroba.

The gold and silver-smiths weights are,

The quilate, or carrat, is four grains.

A tomin, equal to three carrats, twelve grains.

A castillan, equal to eight tomins.

The ounce, equal to six castillans and two tomins.

The mark is equal to eight ounces.

The liquid measures are,

Dos açumbres, or a gallon.

An açumbre, two quarts.

Half an açumbre, one quart.

A quartillo, one pint.

S E C T. V.

A concise History of Spain; the Titles and Arms of the King; of the Nobility, and the Orders of Knighthood. Of the Inauguration of the King, his several Councils and Courts of Justice, his Revenues and Forces.

WITH respect to the history of Spain, it will be proper to observe, that the southern coast was anciently frequented by the Phœnicians for the sake of commerce: after them the Carthaginians came in a hostile manner and reduced the country; but were in their turn dispossessed by the Romans. Towards the beginning of the fifth century it was over-run by the Swabians, Alans, and Vandals; but these were soon subdued by the Visigoths, who entered Spain under the command of their king Atolphus, or Adolphus. Witisa, one of their kings, dying in the year 711, the kingdom was divided into factions, and the public revenues greatly diminished by the wealth which the bishops and clergy had accumulated. Such was the state of the nation when king Rode-

ric ascended the throne, and to him is generally attributed, says Busching, the overthrow of the Gothic kingdom in Spain, though his rape on the lady, or daughter of count Julian, who is said, out of resentment, to have instigated the Moors to invade Spain, has never been sufficiently proved. It is, however, certain, that Spain was delivered up to the Moors by the craft and treachery of count Julian, and Oppa, archbishop of Seville; who not only spirited up the people clandestinely to revolt, but at the bloody battle of Xeres even deserted to the Moors, which turned the scale against the Visigoths. Thus the Moors, who were also called Arabians and Saracens, became masters of the kingdom. This revolution happened in the year 714.

Pelagius, a prince of the Visigoths, with a great number of the Gothic nobility, his followers, withdrew into Galicia, Biscay, and the mountains of Asturia: other bodies of the same nation dispersed themselves into Navarre, Arragon, and the Pyrenean mountains: thus the Gothic empire became divided into a number of petty states; for Pelagius having, in 716, obtained a victory over the Moors, the remaining Goths broke out into inconceivable animosities, and separately laid the foundations of the kingdoms of Leon, Navarre, Arragon, and Sobrarbien; and of the earldoms of Castile, Barcelona, &c. These small states were not only continually at war with the Moors, but with each other. Hence their frequent quarrels and alliances render their history very intricate. The kingdom of Castile and Arragon at length became superior to the rest; but though they were thrice united by marriage, they soon separated again; till, in 1472, a perpetual union took place, by means of the marriage of Ferdinand, hereditary prince of Arragon, to Isabella, heiress of Castile, who, in 1473, became king and queen of Castile; and, on the death of Ferdinand's father, in 1479, of Arragon also. To Castile at that time belonged not only both the Castiles and Estramadura, but Andalusia, Murcia, Leon, and the Asturias; Navarre, Biscay, Guipuscoa, Alava, Rioja, and Galicia; Arragon included Arragon, Catalonia, Roussillon, Valencia, and the islands of Majorca, Minorca, and Yvica.

Ferdinand, on his first obtaining this great kingdom, immediately erected the court of inquisition; and, in 1491, by the conquest of the city of Granada, put an end to the dominion of the Moors in Spain, on which account the pope gave him the title of the Most Catholic king.

By the articles of capitulation on which Granada surrendered, Boabdil, the Moorish king, with his subjects, submitted to do homage to Ferdinand and Isabella, on condition of retaining the possession of their kingdom and their laws, with the free exercise of their religion. But this capitulation was soon violated, and it being resolved to put all to death who refused to be baptized, several hundred thousands of them fled to Africa; and their Jewish subjects, who were very numerous, were banished to Portugal.

Isabella, the consort of Ferdinand, now enabled the justly celebrated Columbus to undertake the discovery of new countries beyond the Atlantic Ocean, and in 1492 he sailed to the West Indies.

In 1504 king Ferdinand acquired, by stratagem, the whole kingdom of Naples. In 1509, he conquered Oran on the coast of Africa, and in 1512 made himself master of the kingdom of Navarre: by which the several states of Spain were united into one body. In 1496 a marriage was concluded between Philip of Austria and Johanna, daughter to Ferdinand, which soon after caused the Austrian dominions to be united to the Spanish; for Charles V. grand-son to Ferdinand, in 1520, became both king of Spain and emperor of Germany; but in 1556 resigned the empire in favour of his brother Ferdinand.

His son and successor to the throne of Spain was Philip II. who also possessed Milan, with the seventeen provinces of the Netherlands, and the county of Burgundy; and in 1581 subdued Portugal. But attempting to govern as arbitrarily in the Netherlands, as his father had done in Spain, and at the same time introducing a kind of inquisition for the suppression of the Protestants, who

who began to be very numerous, occasioned an almost general insurrection, and a civil war commenced, in which the duke of Alva, the king of Spain's general, exercised great cruelties. They were then assisted by Elizabeth, queen of England, and by France. Upon which Philip fitted out the most formidable fleet that ever sailed upon the ocean; this was his boasted invincible armada, with which he attempted to invade England; but it was in a great measure destroyed by the storms of heaven and the bravery of the English.

Philip III. weakened his country by expelling a million more of the Moors, and the new converts that remained behind were perpetually persecuted and tortured by the inquisition.

Under Philip IV. Portugal shook off the Spanish yoke; and several other countries revolted. In 1648 that prince was obliged to acknowledge the United Provinces a free independent state; and in 1659 he lost all the county of Roussillon. Charles II. was dispossessed of a great part of what he enjoyed in other parts of the Netherlands, as likewise of Franche Comté, and by his death in 1700 his family became extinct.

Philip, duke of Anjou, grand-son to Lewis XIV. of France, by Charles's will, ascended the throne of Spain; but this occasioned thirteen years war between France and the house of Austria, till, by the peace of Utrecht, Philip's possession was confirmed by ceding Gibraltar and Minorca to England, and Sicily to the duke of Savoy; the emperor Charles VI. being only able to obtain the Netherlands and certain dominions in Italy.

In 1717 Philip took Sicily and Sardinia from the emperor; but in 1720 acceded to the quadruple alliance, and renounced all claim to France, the Spanish Netherlands, Italy, Sicily, and Sardinia, which was confirmed in 1725 by the peace of Vienna, in which Charles VI. relinquished all pretensions to the crown of Spain: but in 1733 he procured his son Don Carlos to be invested with Naples and Sicily.

In 1739 a war broke out between England and Spain, after which king Ferdinand VI. at the treaty of Aix la Chapelle, found means to procure for his half-brother, Don Philip, the three duchies of Parma, Placentia, and Guastalla. Ferdinand died in 1758, when his brother Don Carlos, king of the Two Sicilies, ascended the throne.

The titles of the king of Spain run thus: Charles III. by the grace of God king of Castile, Leon, Arragon, the Two Sicilies, Jerusalem, Navarre, Granada, Toledo, Valencia, Galicia, Majorca, Seville, Cerdena, Cordova, Corfica, Murcia, Jaen, the Algarves, of Algezira, Gibraltar, the Canary Islands, the East and West Indies, the Islands and Continent of the Ocean; archduke of Austria; duke of Burgundy, Brabant, and Milan, of Hapsburg, Flanders, Tirol, and Barcelona; lord of Biscay and Molina, &c. He also enjoys the title of Most Catholic king, and since the year 1308 the hereditary prince is stiled prince of the Asturias. The other royal children are called *infantas*.

The arms of Spain are a shield divided into four quarters, of which the uppermost on the right hand and the lowest on the left contain a castle or, with three towers for Castile; and in the uppermost on the left and the lowest on the right are three lions gules, for Leon; with three lilies in the center for Anjou.

The inferior nobility stile themselves *cavalleros* and *hidalgos*; but enjoy no privileges above the burghers. However, the higher nobility, including the dukes, marquisses, and counts, who are stiled the *titulos*, or *titulados*; and particularly the *grandees*, who take precedence next the king and the princes of the blood, enjoy great privileges. They are divided into three classes, but consider themselves as being all upon an equality: yet when the king nominates a grandee, if he be of the first class, he kisses the king's hand, and returns his majesty thanks covered; if of the second, he does not cover himself till after the compliment; and if of the third, he does not put on his hat till he has kissed his hand, and returned to his place among the *grandees* who are present.

The pre-eminence of a grandee does not solely consist of his being covered in the king's presence; this being common to others, as cardinals, nuncios, archbishops, and the ambassadors of crowned heads; for at an assem-

bly of the states, or the nomination of a king, they take place of all temporal lords, the constable and amirant of Castile excepted. They enjoy all the privileges of a duke, though no dukes by title. When the king takes the air on horseback, they ride next to his person, the master of the horse only excepted, who by virtue of his office rides by the king's side. The king in writing or speaking stiles them prince or cousin-german. At an audience of the pope they are permitted to sit, and he gives them the title of Sennoria. No grandee can be taken into custody for any offence, unless by express order of the king; and it must be high treason, or some other heinous crime against the state, that can occasion the obtaining of such an order. They and their eldest sons are stiled Excellency, and they even esteem themselves equal to the princes of the empire and of Italy.

The principal order of knighthood in Spain is that of the Golden Fleece, which received its origin from the Burgundian dominions, and at present belongs both to the kings of Spain and the house of Austria. The collar of the order consists of an alternate range of golden flints and steels, with sparks of fire on all sides, and a golden fleece pendant from it, with this motto, *AUTRE N'AURAI*. Charles V. permitted the knights, instead of this collar, to wear only a scarlet ribbon.

The three orders properly Spanish, and which have a revenue annexed to them, are,

The order of St. Jago di Compostella, instituted in 1175, by Ferdinand II. king of Leon, and has for its badge a red uniform cross, divided into twelve departments. This order has four convents who are brothers of the order, seven religious ones, one college, five hospitals, and six hermitages.

The order of Calatrava, instituted by Sancho III. of Castile, has for its badge a red cross, divided into five departments. To this order belong one convent of religious, and one college.

The order of Alcantara, the badge of which is a lily placed cross-wise, was instituted by Ferdinand II. king of Leon, and was at first called St. Julian de Peregro. This order is also divided into five departments, and to it belong three convents of religious, and one college.

The king is grand master of these orders.

Besides these, the present king of Spain has now introduced the Neapolitan order of St. Januarius; and has ordered it to be worn in his court above the French order of the Holy Ghost, or that of the Golden Fleece.

Spain, from the Gothic times to that of Pelagius, was an elective kingdom; and for two centuries afterwards the throne was filled by the suffrages of the states, who, however, in no instance departed from the royal family. At present the crown of course devolves, without any form or ceremony, to the nearest in blood, and females are capable of inheriting; but it is only on the failure of the male line. If the next heir be incapable of government, especially when on the decease of the former king affairs are in confusion, the states are impowered to choose five persons to take the administration upon them, among whom the queen-mother is to hold the chief place.

On the inauguration of a new monarch, he is proclaimed in the church of the Jeronites at Buen Retiro, and receives homage from the states; but he is neither anointed nor crowned; for these ceremonies have been disused for some centuries.

The ancient Spanish cortes resembled our parliament, it consisting of the clergy, the ancient nobility, and the deputies of the towns; and the legislative authority was so blended in that of the king and the states, that no laws could be made, repealed, or suspended, nor any money raised upon the subjects, but with their common consent. But now this cortes is laid aside; Spain is no longer a mixed monarchy, but entirely absolute; the whole government being in the hands of the king and his ministers, and the councils, which are always at his devotion. This change from mixed to absolute monarchy, was occasioned by the timidity of the commons of Castile, who having, in their last struggles for expiring freedom, supported for some time a war against the crown, on a single defeat, in the most abject manner deserted the noble cause of liberty. This war began in the year 1520, and lasted only two years; at which

time

time Charles V. carried his point with a high hand, and told the cortes he would always have the supplies granted first, and then would pass the bills they petitioned for, and not before, to which they timidly submitted. Since the time of Philip III. in the beginning of the seventeenth century, the cortes have been discontinued, and there have been no other assembly than conventions of the deputies or agents of the towns, among whom are settled the necessary taxes.

The laws of Spain are chiefly compounded of the Roman civil law, the royal edicts, and probably certain provincial customs. Where they thought the Roman law was not sufficiently extensive, they have made large additions of their own; these are called the *Leyes de Partidas*, and at present form a system of modern Spanish law, and have been published in six volumes octavo. The name *Partidas* comes from their being divided into chapters.

The most weighty affairs of state are discussed in the council of state, which consists of a president, three other counsellors, a secretary of state, and two other secretaries.

The supreme royal council, or royal council of Castile, is the highest court of judicature, and is divided into five inferior courts or chambers, viz. the first and second halls of government, which are frequently assembled as one, to determine appeals made from the chanceries of Valladolid and Granada. The hall of the *Mily Quinientos*, so called because the parties must first deposit fifteen hundred doblas, about two hundred and twenty-three pounds, before the appeal can be lodged: this is nothing more than a committee of the supreme council. The hall of Justice, which is a court for matters purely litigious; and the hall of the Province, which is a court for matters chiefly relating to the police; the provinces being distributed among the seven counsellors of the first hall of government.

The chamber of the alcaides of the court and household, which may also be classed with the great councils, consists of a governor or president, twelve judges, and a fiscal.

The supreme council of war is at present composed of four counsellors, one of whom is secretary, one fiscal, and three assessors, who are members of the royal council of Castile. This council determines all causes relating to the army, except what belongs to the following council.

The supreme royal council of the Indies consists of a governor, twenty-two counsellors, four secretaries, two for Peru and two for New Spain, one accomptant general, and other officers. This tribunal decides without appeal in affairs relating to the Spanish seas and possessions in America.

The council of the finances is divided into four chambers, or halls.

The great court of the civil law is divided into the two chambers of Valladolid and Granada, which include the whole kingdom: but though Arragon, Valencia, and Catalonia, lost their old privileges, yet they still retain a court of chancery among themselves, in audiences held in the capital of each kingdom, whose determinations are only subject to the supreme council of Castile. If it be a case of property, the suit is commenced in that chancery to which the plaintiff belongs, and then the affair is referred to the supreme royal council, at which the king may order all the deputy councils to assist. All other causes go before the respective courts to which they belong.

The revenue of the king arises principally from the tenth of every thing sold, to which may be added the tithes and fourths of a hundred; the excise on wine, oil, tallow, soap, paper, salt-fish, &c. the usual aid of four hundred and forty-one thousand one hundred and seventy-six crowns, paid by all under the rank of nobility; the wine-gauge money; the stamp duties, and the half annates; the duties on provisions, which is fourteen per cent. those on salt, tobacco, the post-office, the regulations of the crown of Arragon, and the bull of the crusado, by virtue of which the clergy and laity pay a contribution towards carrying on a war with the infidels, even whether there be any such war or not;

indulgences; licences for eating butter, cheese, milk, and eggs, in Lent; the subsidies and tithes of church and abbey-lands; the money paid by those orders in lieu of the lances and galleys they were bound to furnish; the taxes on downs, commons, and other pastures; the Madrid excise; the thirds, tenths, and patrimonial rents of Catalonia, Arragon, Valencia, and Majorca; the ecclesiastical payments for the military hospitals; the quicksilver, and other American revenues; the West-India trade; the coinage, &c. all which together amount at present to about three million three hundred seventy-three thousand two hundred eighty-eight pounds sterling.

The Spanish land forces consist of ninety-six thousand five hundred and ninety-seven men. The kingdom is also well defended on all sides: towards France it has a secure fence in the Pyrenean mountains; and the sea-coasts are lined with redoubts, forts, and towers; and up the country the army of an enemy would be put to very great inconveniences, particularly the horse, for want of forage.

The naval forces of Spain consist at present of forty-seven ships of the line, twenty-one frigates, fourteen xebecs, four packet-boats, and seventeen bomb-vessels; the complement of all which amount to forty-five thousand nine hundred sixty men.

The foreign possessions of the crown of Spain in Africa, are the towns of Ceuta, Oran, and Masalquiver, on the coast of Barbary; in Asia, the islands of St. Lazarus, the Philippines, and Ladrones; the greatest part of the main land of South-America; and in North-America, Mexico, New Mexico, California, the island of Cuba, part of Hispaniola, Porto Rico, &c.

S E C T. VI.

The Divisions of Spain, with a Description of the Kingdom or Province of Catalonia, containing its Situation, Extent, Rivers, Produce, and principal Cities, particularly Tortosa, Tarragona, Barcelona, Roses, and Gerona.

THE kingdom of Spain consists of main land and islands. The main land is divided into fourteen provinces, some of which are reckoned to belong to the crown of Castile, and others to Arragon: the former are Old and New Castile, Biscay, Leon, Asturia, Galicia, Estremadura, Andalusia, Granada, Murcia, and Navarre; the latter includes only Arragon, Catalonia, and Valencia, with the islands in the Mediterranean.

We shall begin with Catalonia, which is bounded on the west by Arragon and Valencia; on the south and east by the Mediterranean; and on the north is separated from France by the Pyrenean mountains. Its greatest extent from east to west is a hundred and twelve English miles, and from north to south a hundred forty-eight. It was formerly larger than at present; but France has, at different times, curtailed it of the counties of Roussillon and Conflans, a good part of Cerdagne, and long since of Foix.

This fine country is watered by several rivers, some of which intermix, while others discharge themselves separately into the sea. Of the first sort is the Segre, in Latin Sicoris, the largest of all the rivers of Catalonia. It has its source in Cerdagne, and receives in its passage the Noguera Pallaresa, the Noguera Ribagorçana, and the Cervera. It afterwards unites with the Cinca, and at last loses itself in the Ebro. Of the second kind, besides the large river Ebro, which passes through only a small part of Catalonia, is the Francoli, which falls into the sea at Tarragona; the Llobregat, anciently called the Rubricatus, which receives its source in the mountain of Pendis, and discharges itself into the sea below Barcelona; the Besos, or Betulus, which also joins the sea not far from Barcelona; the Ter, Thicis, or Thiceris, which issues between the mountains, and discharges itself into the sea below Torcella; the river Fluvia, which falls into the sea near Empurias; and another Llobregat, the mouth of which is near Roses.

Though Catalonia does not produce sugar-canes, like the rest of the provinces of Spain, yet it enjoys a very good

good soil, with a pure and wholesome air. The winters in the northern parts, contiguous to the Pyrenees, are attended with some frost and snow; but in the southern, particularly along the sea coast, that season is very mild. It is almost entirely mountainous, a few places excepted, which extend themselves into most delightful plains; but these mountains are so far from being barren, that they are covered with wood and fruit trees. The country yields plenty of wine, corn, oil, pulse, and fruits, and also produces a great quantity of flax and hemp. The flesh meat of this country, and in general all provisions, are excellent.

With respect to minerals, marble, crystal, alabaster, jasper, amethysts, &c. are found here; likewise gold, silver, tin, lead, iron, alum, vitriol, and salt, and the coast has several coral fisheries. In short, this province is one of the most populous in all Spain, and contains an archbishoprick, seven bishopricks, twenty-eight large abbeys, one principality, two duchies, five marquisesates, seventeen earldoms, fourteen viscounts, and a multitude of baronies.

Some geographers divide this principality into Old and New Catalonia, including in the former the country extending eastward from the Pyrenean mountains along the river Llobregat to the Mediterranean; and, in the latter, they comprehend that tract to the west, which extends from the Llobregat to the confines of Valencia and Arragon. This country is usually divided into fifteen jurisdictions, six of which lie along the coast; these are those of Tortosa, Monblanc, Tarragona, Villa Franca, de Panades, Barcelona, and Gerona. Along the Pyrenean mountains are the two jurisdictions of Campredon and Puicerda, with the earldom of Cerdagne. The two jurisdictions of Belaguer and Lerida join to the frontiers of Arragon; and within the country are those of Agramont, Tarrega, Cervera, Manresa, and Vique: but as it is impossible to distinguish with any certainty the places belonging to each jurisdiction, we shall insert the most remarkable, without strictly attending to these minute divisions.

Tortosa is an antient, large, and fortified city, on the Ebro, over which it has a bridge of boats. It lies partly on a level, and partly on a hill, eighty miles to the west-by-south of Barcelona, and a hundred and eighty-five to the east of Madrid. It is divided into the Old and New Town, of which the former is the largest. The avenue to it is defended by two bastions and other out-works, and the antient strong castle, which is built in the form of a citadel, stands on an eminence between the two towns. Here are five gates, seventy-eight streets, with a spacious square or market-place, and many churches and convents; the bishop, who is suffragan to the archbishop of Saragossa, has an annual revenue of fifteen thousand ducats. Its university is inconsiderable; but the adjacent country abounds in corn and fruit, oil and silk, and with quarries and mines; for there are those of silver and iron, alabaster, very fine jasper of various colours, and stones with veins of gold. They also make here fine potters-ware, which resemble porcelain.

Tarragona, an antient and strong city, is situated on an eminence near the mouth of the little river Francoli, forty-five miles to the north-east of Tortosa, and about the same distance to the west of Barcelona. It is neither so large nor so populous as it was formerly; for though there is room for two thousand houses within the walls, there are not above five hundred, which are all built of large square stones; but it is still the see of an archbishop, who enjoys a revenue of twenty thousand ducats a year. It has an university founded in the year 1532. Its harbour, on account of its many rocks, will not admit of ships of burthen; but it has a pretty good trade. The neighbouring country produces corn, oil, flax, and very good wine; and both within and without the city are to be seen the ruins of magnificent buildings, and other ornaments of antiquity.

In this city are a multitude of Roman inscriptions, and not far from thence, in the road to Barcelona, you pass under a very handsome triumphal arch, erected by the family of the Licinii, adorned with fluted Corinthian columns, and a pediment with dentiles, like the Ionic order. A little way on one side the road, somewhat

farther on, is the tomb of the Scipios; it being the base of an obelisk, or pyramid, erected to their memory, with a figure on each side in the Roman habit; these are by some thought to be designed for the two Scipios, but others suppose them to represent weeping slaves.

Barcelona, or Barcino, the capital of Catalonia, is a large and well fortified sea-port, seated at the foot of Montjoui, in the forty-first degree twenty minutes latitude, and in the second degree five minutes east longitude. It opens to the sea in a beautiful semicircle, between the rivers Llobregat and Besos. It is a large and well fortified place, divided into the Old and New Town, which are separated from each other by a wall and ditch. Most of the streets are broad, well paved, and clean. It has many beautiful structures, a large and superb cathedral, with some other beautiful churches and convents, and several handsome squares. At the church of Capiulefmona, or the Alms-taker, close by the cathedral, three hundred poor people are daily fed. The number of houses in Barcelona is computed at about fifteen thousand. Its bishop is suffragan to the metropolitan of Tarragona, and his annual revenue is computed at ten thousand ducats. Here is also an university, an academy of the fine arts erected in 1752, a court of inquisition, and a royal audience of Catalonia, in which, next to the governor and captain-general, sits the regent. The other members here are ten counsellors, five criminal, or justiciary, officers, and two fiscals. On the coast of Barcelona is a safe road. The city carries on a good trade, and has a large, deep, and secure harbour, defended on one side by a large mole, at the extremity of which is a lighthouse, with a little fort, and a garrison for the defence of small vessels, those of larger burthens lying out in the road. On the other side the castle of Montjoui covers the harbour, between which and the city is a line of communication, and upon this is a fort, whereby the entrance of the harbour is flanked and commanded.

Barcelona had its own counts till the year 1162, when it was united to Arragon. In 1640 the inhabitants revolted, and put themselves into the hands of the French; but in 1652 the city was reduced by the Spaniards. In 1691 and 1697 it was besieged and taken by the French, under the duke of Vendosme; but the same year was restored to the Spaniards by the treaty of Ryfwic. The French possessing themselves of this city and the rest of the Spanish monarchy in 1700, king Charles III. afterwards emperor of Germany, by the title of Charles VI. took it on the fourth of October, 1705, sword in hand, after a siege of only three weeks, with a handful of men, not much more numerous than the garrison which defended the place. In April 1706, Philip, duke of Anjou, and marshal Tessé, invested it with a large train of brass artillery, and a numerous army; but the city, animated by the presence of king Charles, held out thirty-five days, till relieved by lord Peterborough and Sir John Leake, who coming up with the English fleet, the French and Spaniards raised the siege with great precipitation, leaving behind them all their cannon, ammunition, tents, baggage, and wounded men. The city remained in the possession of Charles III. till the year 1712, when his brother Joseph dying, he became emperor; and the citizens erecting themselves into a sort of commonwealth, set up for an independent state; but in 1714, after holding out a long siege against the duke of Berwick, the inhabitants were obliged to submit to Philip V. and still continue in subjection to the crown of Spain.

The neighbouring country abounds with wheat and other grain, oil, rich wines, fruit of all sorts, wood, cattle, fowl, plenty of wild game, and honey. It is well watered, and thick set with villages. They have silk and woollen manufactures, and excel in iron and steel works.

Rosas, or Rosas, a town of Catalonia, considerable for its strength, trade, and commodious harbour, is situated on a bay of the same name on the Mediterranean, about sixty-two miles to the north-east of Barcelona. It was in a declining condition till Charles V. rebuilt, fortified, and peopled it; since which time it has flourished very much, especially under the French, who, from its vicinity to them, have often made themselves masters of it; but have always been obliged to give it up at the

conclusion

conclusion of a peace. This was the only place in all Catalonia that held out for king Philip V. during queen Anne's wars, while all the rest of the province had submitted to Charles III.

Gerona, antiently Gerunda, is an old fortified city, standing on an acclivity adjoining to the Onhar, which at a small distance falls into the Ter. It is an earldom, and a place of considerable trade; yet the revenue of its bishop, who is suffragan to the archbishop of Tarragona, is only three thousand ducats a year, and its university makes no great figure. The large jurisdiction, of which this is the capital, is reckoned the most fertile tract in all Catalonia. In 1694 this city was taken by the French; in 1697 by the Spaniards; in 1705 by the forces of Charles III. and in the year 1711 was again taken by the French.

S E C T. VII.

Of the Kingdom or Province of Arragon; its Situation, Extent, Rivers, Produce, History, and principal Cities; with a more particular Description of Saragossa.

THE kingdom of Arragon is bounded on the north by the Pyrenean mountains; on the east by Catalonia; on the south by Valencia; and on the west by Navarre and Castile. Its extent from north to south is upwards of a hundred and sixty miles, and from east to west above a hundred and four. The river Ebro crosses the country from the north-west to the south-east, dividing it into two almost equal parts. Into it the following rivers discharge themselves: on the north side the rapid Cinga, or Cinca, which rises in the mountains of Bielsa; the Callego, the antient Gallicus, which issues from Mount Gavas; the Isuela; and several other smaller streams. From the south it receives the Xalon, or Salo, which comes from New Castile, and the still smaller streams of Guadalaviar and Alhambra, all of them having plenty of good fish. The Torio, or Turio, fertilizes a great part of the country by its slow and gentle course, which gives the husbandmen and gardeners an opportunity of cutting channels from it to water their grounds, which are much admired for their continual verdure and fertility. In short, Arragon, both on these accounts and the serenity of its air, has been compared to Egypt; but this account of its fertility, given by some authors, seems exaggerated, for it is only true of particular spots; and Dr. Busching observes, that, with all these rivers, the greatest part of Arragon is dry and barren, and some places even uninhabited: the soil is for the most part sandy, mountainous, and stony; so that where the rivers do not come, or where water is not conveyed by art, it produces nothing. In those parts, however, which are watered are corn, wine, oil, flax, fruit, and in some places also saffron, which make up the whole riches of the country.

Arragon had formerly its own laws and privileges, some of which were so considerable, that they had even a supreme magistrate called the justica, or mayor of Arragon, whose office was to check the power of the sovereign in behalf of the subjects; so that appeals lay to him from the other courts, and even from the king himself. Ennecus, surnamed Arista, from his love of fighting, who had been elected king of Navarre by the vote of the people, was the first chosen into this office. They had besides by a special contract made with their first king, and sworn to by all his successors, this farther privilege, that if any of those monarchs should infringe their liberties, they might lawfully take up arms against them. Peter, one of the kings of Arragon, was the first who prevailed on their cortes, or parliaments, to abolish this privilege, and accept of some others. At length Philip II. of Spain, the son of the emperor Charles V. being enraged at the Arragonians for defending Anthony Perez, his secretary, sent an army against them; and having defeated and deprived them of all their privileges and liberties, reduced them to the level of the meanest province. Dr. Busching, however, gives a different account of that affair, and says, that the inhabitants of Ar-

ragon having, in the year 1605, espoused the party of the archduke Charles III. Philip V. annulled all their privileges, and rendered them subject to the laws of Castile, by which the revenues of the crown from that kingdom were considerably encreased.

The natives of Arragon are generally courteous, well-bred, ingenious, generous, well versed in military affairs, courageous, strict observers of their laws; but bigotted in religion, and positive in their opinions.

Arragon is divided into seven dioceses, namely, an archbishopric and six episcopal sees. It has ten cities, two famous universities, several considerable abbeys, besides monasteries, nunneries, hospitals, &c.

Saragoza, or Saragossa, the capital of this country, stands in a very fertile plain on the Ebro, by whose windings the neighbouring country is rendered so fertile, that it produces a variety of fruits in great abundance. It is surrounded with walls, which, though antique, are strong and beautiful, being adorned with several stately towers, and four noble gates facing the four cardinal points. It is said to have been built by the famous king Juba, and afterwards beautified by Augustus, while he was carrying on the war against the Cantabrians. It is of an oblong figure, and has two strong and stately bridges over the Ebro. The city is large and handsome, the streets long and broad, but ill paved and very dirty. The handsomest and broadest is the Calle Santa, or Calle de Cosío, which is the usual airing-place of the quality. It has a multitude of magnificent buildings, as churches, palaces, squares, market-places, and hospitals.

The number of inhabitants amounts to fifteen thousand families, many of them of quality, included within fourteen large parishes, and three others that are smaller. Here are also twenty-three monasteries, some of them large and magnificent, thirteen nunneries, and a noble hospital endowed with a revenue sufficient to maintain eight hundred sick persons, besides two others for orphans, some smaller for decayed people, and a very noble one at a small distance from the city. Here is also an university, which was founded in 1474.

The cathedral is a rich and stately edifice, in which are twelve dignitaries, twenty four canons, thirty-nine minor canons, and seventy beneficed priests. The annual revenue of the archbishop is about forty-five thousand ducats. The tabernacle, or repository of the pix over the high altar, is a magnificent piece of architecture, all of massy silver finely wrought, and weighing six hundred and twelve pounds.

The collegiate church of Our Lady of the Pillar, so called from a pretended miraculous image of the Virgin, is likewise a fine structure. This image is very small; but its crown and robes are almost entirely covered with rich ornaments, and holds a little Jesus in its arms. It stands very high on a pillar of the finest jasper. Whoever attentively views the image, finds his eyes dazzled with the multitude of silver lamps and wax lights continually burning in the chapel, mingled on all sides with the reflection of the gildings, jewels, and golden chandeliers. To this image a vast number of pilgrims annually resort, in order to pay their devotions to the Virgin.

Among the civil buildings is the palace, where the cortes meet, and the exchange, two very magnificent structures; the latter built in the year 1551, and the former much earlier; but greatly beautified since. The royal palace stood at a small distance from the city, and has been given to the fathers of the inquisition.

The city carries on a considerable commerce, and a great number of trades and manufactures both within and without the walls; for it has handsome suburbs, and many fine buildings without the gates, as well as gardens, orchards, and beautiful walks.

Teruel, or Tervela, about eight miles to the south of Saragossa, situated on the banks of the Turio on a pleasant eminence, encompassed with spacious meadows inclosed and sheltered by high and fertile mountains, covered with variety of stately trees, odoriferous plants, and fragrant flowers, which, with a multitude of gardens, orchards, and corn-fields, afford a most delightful prospect. The city is walled, and inhabited by thirteen hundred

dred families, who are divided into eight parishes; besides which there are four monasteries, one nunnery, and a wealthy hospital. It is the see of a bishop, whose revenue amounts to twelve thousand ducats; the cathedral has six dignitaries, and fourteen canons, besides inferior priests.

About forty-five miles to the south-west of Saragossa is Catayud, which is situated at the foot of a pleasant high hill on the banks of the Xalon. Its soil, situation, and air, are inferior to none in Spain in their fertility, pleasantness, and salubrity. The walls are strong, and adorned with many stately towers, and the city populous, it having about three thousand families, divided into thirteen parishes, with eleven monasteries, and four nunneries. The Romans, who gave it the name of Bilbilis, adorned it with several magnificent buildings, and endowed it with many privileges. It was particularly celebrated for being the birth-place of Martial the famed Epigrammatist.

S E C T. VIII.

Of the Kingdom or Province of Valencia; its Situation, Extent, Produce, and Rivers; with a particular Description of the Cities of Valencia and Alicant.

VALENCIA is bounded on the west by Murcia and New Castile; on the north by Arragon and Catalonia, already described; and on the east and south by the Mediterranean sea; extending about a hundred and sixty-two miles in length, and sixty-two in breadth; and is the most populous and pleasant country in Spain; for here they enjoy an almost perpetual spring. The country, besides its extraordinary fertility in wine and fruits, produces also rice, flax, hemp, silk, honey, and sugar; and if the surface of its mountains is less fruitful, this is well compensated by the minerals within.

All its rivers run to the east or south-east into the Mediterranean: these are the Segura; the Xucar; the Guadalaviar, which receives its source in the confines of Arragon and New Castile; its banks are delightfully bordered with woods and flowers, and it loses itself in the sea below Valencia: the others are the Morviedro and the Millares.

Valencia, the capital of the province, stands on the shady banks of the river Guadalaviar, over which it has five stately bridges, in the forty-first degree thirty-six minutes latitude, and nearly under the meridian of London. It seems to have been originally built by the Romans; but was destroyed by Pompey, and a little after rebuilt by Cæsar, and called Colonia Julia Valencia. It stands opposite to the place where the famous city of Saguntum formerly stood, on the other side of the river. Its present form is almost circular; it is about six thousand four hundred and forty paces in circuit, and is surrounded by a strong wall, which has many lofty towers, and thirteen gates. Grao, its sea-port, which stands on the Mediterranean, furnishes it with every thing either for convenience or delight, particularly with a great variety of sea-fish, and its neighbouring lake of Albufera with great abundance of water-fowl and fresh-water-fish; as does the fertile country round it with corn, wine, oil, fruit, herbs, and other provisions. Mulberry-trees are planted in rows in all the fields, and so industrious are the inhabitants in its neighbourhood, that the ground never lies fallow. The city is said to contain fifteen thousand families, fourteen parish-churches, forty-eight monasteries and nunneries, besides other foundations of the military order, six chapels, six hospitals, and twenty fraternities, which every year give portions to a hundred and thirty poor maidens on their marriage. Here is also an university, with five colleges.

Valencia is the see of an archbishop, whose revenue amounts to forty thousand ducats a year. The cathedral has seven dignitaries, twenty-four canons, besides minor canons, and other inferior priests. Among other valuable treasures in this structure is a chalice of a rich kind of agate, which they ridiculously pretend to be the same our

Saviour used at his last supper. They also give out, that they have two of the thirty pieces which Judas received from the Sanhedrim as the reward for betraying his Divine Master; they are of silver, and weigh about fifteenpence of our money. Nothing can be more magnificent than their grand procession on Corpus Christi day, when these are carried with the utmost pomp and devotion.

Here is also a sovereign court of judicature, a court of inquisition, and an exchange. The city is plentifully supplied with water, not only from the river, but from a vast number of deep wells dug almost in every house, and some compute that those within and without the walls amount to thirty thousand. There is here also an extraordinary common sewer, said to be a Roman work, by which the soil of every house is carried off under ground. Upon these accounts it is reckoned one of the healthiest and most pleasant places in Europe.

The city is enriched by the vast number of quality and gentry who reside in it, and its great commerce; there is a variety of manufactures carried on here, especially the woollen, the cloth made in this city being reputed the finest in all Spain. The silk manufactures likewise flourish here: the inhabitants also export large quantities of wine, oil, and fruit. In the markets of Valencia, and all over Spain, they cut their poultry into pieces, and sell them by quarters. Here they make large vessels of goats skins, for putting their oil and wine into.

The government of the city is by six jurats, or consuls; there is also a judge for criminal causes, with an advocate to assist him, and a lieutenant-criminal; a mustafa, who has the care of all provisions, corn, weights, measures, &c. and a judge for civil causes.

In the year 1705, when all Catalonia had submitted to Charles of Austria, the nominal king of Spain, this city likewise opened her gates to the earl of Peterborough and the English forces. Though after the unfortunate battle of Almanza, in 1707, the duke of Orleans, who commanded the Spanish troops for Philip of Anjou, recovered it; after which the inhabitants were severely punished by that prince for their forwardness in revolting, and stripped of the greatest part of their ancient privileges, which they had preserved with the utmost bravery.

Alicant is situated sixty miles to the south of Valencia, and at the same distance north of Carthage, in the thirty-eighth degree thirty-seven minutes north latitude, and in about five minutes west longitude: this is a celebrated city and sea-port on the Mediterranean, delightfully seated between two hills. It is well walled and defended by a castle built on a high rock. On the neighbouring shore stand several watch-towers, from which the vessels of the Sallee rovers are observed. It is a place of considerable trade, on account of its commodious harbour, and is well known to the English, especially for its wines and fruit, which they used to bring from thence; as well as from their landing some of their forces here in the reign of queen Anne, when the succession to the crown of Spain was contested between Charles of Austria and Philip of Anjou. The city then contained about seventeen hundred families, two parish-churches, one of which is collegiate, with six monasteries, two nunneries, and three handsome market-places; besides hospitals, chapels, &c. The English made themselves masters both of the city and castle in the year 1705, and held them till the peace of Utrecht in 1713, when they returned to Philip of Bourbon, styled Philip V. of Spain.

About half a league from the city is a famous convent of nuns, to which there is a great resort of pilgrims, in order to pay their devotions to the impression of the holy face, said to have been imprinted thrice on a napkin with which Veronica wiped the face of our Saviour, when he was going to his crucifixion. Among these votaries are many seamen, who on their leaving Alicant frequently make a vow of performing their devotions here upon their safe return, which they do bare-footed. This picture of our Saviour's face, said to be represented in so miraculous a manner on a piece of white linen, we are told is a wretched piece of dawbing.

S E C T. IX.

Of the Kingdoms or Provinces of Murcia and Granada; their Situation, Extent, Rivers, Produce, and principal Cities.

THE kingdom or province of Murcia is bounded on the north by New Castile, on the east by the kingdom of Valencia, on the west by Andalusia and Granada, and on the south by the Mediterranean sea, extending about sixty-two miles in length, and fifty-eight in breadth.

The principal river is the Segura, which receives its source in New Castile, and running from west to east traverses this country and that of Valencia.

The air of this province is pure and healthy, and the country produces corn and wine, which are both good; but as the country is very mountainous, and the soil dry, from its having but little rain, its products are but in small quantities. It, however, abounds in fine fruits, as oranges and lemons, and also with sugar, honey, and silk. The principal places in this province are,

Murcia, the capital of the kingdom, which is seated in a pleasant plain on the river Segura, in the thirty-eighth degree twelve minutes north latitude, and in one degree fourteen minutes west longitude, and is pretty large and populous, with large handsome streets. It is walled round, and has twelve gates. It contains six parish-churches, and a superb cathedral, which has a steeple so contrived that a man may ride up to the top, either on horseback or in a coach. It is the see of a bishop, who has a revenue of twenty thousand ducats. Round the city are fine gardens, which abound with excellent fruit.

Carthagená, or Little Carthage, is a pretty good city, standing on the side of a hill, by a fine bay of the Mediterranean, at the mouth of the river Guadalquivir, in the thirty-seventh degree forty minutes north latitude, and in one degree five minutes west longitude. It has one of the best harbours in the kingdom: the small island Escombrada so shelters it from storms, that vessels moor here in the utmost safety: it has plenty of fresh-water, and abounds with mackerel. The air is here so temperate in summer, and mild in winter, that the trees have leaves, blossoms, and fruit at the same time; and even roses blow here at Christmas. The adjacent country produces a great deal of sedge, and in the bowels of the earth are found amethysts, garnets, agates, and other gems. This city is the see of a bishop, who enjoys a revenue of twenty-four thousand ducats, and is suffragan to the archbishop of Toledo. It contains about twelve hundred inhabitants, and has four monasteries and a nunnery: it lies twenty-six miles to the south of the city of Murcia.

The kingdom of Granada, sometimes called Upper Andalusia, is bounded on the east by the kingdom of Murcia, on the south by the Mediterranean sea, and on the north and west by Andalusia. It is about a hundred and seventy-five miles in length, and seventy-five in breadth.

The principal rivers are the Xenil, which rises near the city of Granada, and passing through Andalusia, falls into the Guadalquivir; and the Guadalquivir, which also rises in this province, and, after traversing Murcia, runs into the Mediterranean. There are also a great number of smaller rivers.

The country is very mountainous, particularly towards the sea; but is interspersed with delightful valleys. The Las Alpuxarras are mountains of a prodigious height, inhabited by a Moorish race who have embraced the Romish religion; but still retain their national customs and manner of living, and their language is a mixture of Arabic and Spanish. They are divided into eleven districts.

The air in this country is temperate and healthy, and in general it is very fruitful, and produces corn, wine, oil, sugar, flax, hemp, and fine fruit, as pomegranates, citrons, oranges, lemons, olives, figs, grapes, and almonds. There are prepared here two kinds of raisins,

those dried by the sun on the branches of the vines, and others which are dipped in the lye made of the ashes of the burnt branches, and afterwards dried in the sun. Here is also great plenty of honey and wax. Several places in the mountains near Antequera make salt, which the sun prepares from water conveyed into pans. The cultivation of silk is here also very considerable. The country likewise produces plenty of dates, of which great advantage is made, and even of the very acorns, which are said to exceed the finest nuts: and of the galls, which are found in this country in vast quantities, a dye is made for leather. Great quantities of sumach, for preparing goat and chamois skins, are likewise exported from hence. Besides good stone for building, the earth affords hyacinths, garnets, and other gems.

In the time of the Moors, Granada was the most populous and best cultivated province in Spain; but through the contempt which the Spaniards entertain for agriculture, things are much altered; however, Spain has not any tract of land so well inhabited as the mountains of Las Alpuxarras, which, besides the many towns and villages interspersed among them, are wonderfully improved by the industry of the inhabitants, who turn their vineyards and plantations to a very good account. The sea-coast, for its protection against the African corsairs, is lined with high towers, which command an extensive prospect over the sea, from the strait of Gibraltar to the Rio Freyo, or the Cold River.

This province became a distinct kingdom in the thirteenth century, when the Moorish king Abenhud, who resided at Cordova, losing his life and crown in a battle against the Christians in 1236, his subjects and followers betook themselves to Granada, and chose a new king, who made the city of that name his capital and place of residence. This kingdom, which was the last of the Moorish, then contained thirty-two large towns and ninety-seven smaller, and continued from the year 1236 to 1492, when Ferdinand the Catholic reduced it, and annexed it to the crown of Castile.

The city of Granada, the capital of the province, stands at the foot of a most noble ridge of barren mountains and rocks, which stretch round on each side in such a manner as to embrace a lovely plain, varied with plantations, gardens, and villages. It is seated by the river Xenil, into which the Darro falls after watering a part of the city, in thirty-seven degrees twenty-eight minutes north latitude, and in three degrees fifty-one minutes west longitude. It is fortified with walls and towers, and is the see of an archbishop, who has forty thousand ducats a year. The city is divided into four wards, the principal of which, called Granada, lies in the plain, and in the valleys between two mountains; and here the nobility, clergy, merchants, and most wealthy citizens reside. Its public and private buildings are very handsome. In the cathedral lie buried several kings, as Ferdinand the Catholic, and Philip I. with their queens. The king's tribunal is held in a large and stately edifice, and opposite to it is the Alcaxeria, a vast building, in which the merchants have their ware-houses. In the great square are held the bull-fights. The university here was founded in 1531, and the city has also a court of inquisition.

The Moorish palace, called Al-Hambra, is built on a high hill that over-looks the city and the valley, and contains many grand apartments, all in the Moorish stile, with alcoves, domes, fountains, Arabic inscriptions, &c. besides which there is a part built by Charles V. but not finished. The front is handsome, and the apartments built round a very beautiful circular court, with thirty-two fine marble pillars below, and as many in a gallery above. Not far from it is a delicious garden of the Moorish kings, with all kinds of trees flourishing upon a steep hanging rock, and as much water as supplies a number of jets d'eau and fountains.

When Ferdinand the Catholic made himself master of this city, the short method taken by cardinal Ximenes, for the conversion of the Moors, was, that they should either be baptized, or be put to death. The present inhabitants consist of the descendants of the antient Moors, and of old Spanish Christians as they are termed.

Malaga

Malaga is an antient fortified sea-port, in thirty-six degrees fifty-one minutes north latitude, and in four degrees fifty-six minutes west longitude, two hundred and sixty miles to the south of Madrid, and seventy-five to the south-west of Granada. It stands at the foot of a steep mountain, and has one of the best roads on all the coast, with a fine moat running into it five hundred and thirty paces long, and twenty broad, with stairs for taking water, and several pillars of jasper to fasten ships to, as also a chapel upon it for sea-faring people. The city is handsomely built and populous, it being defended by two castles, one on the top, and the other at the foot of the mountain. It is large, and of a circular form, surrounded with a double wall, strengthened by stately towers, and has nine gates. On one side the sea washes its walls, and on the other runs the little river Guadalquivirejo, over which there is a handsome bridge. It is the see of a bishop, whose revenue amounts to twenty thousand ducats a year. The grounds all round being covered with vines and the greatest variety of fruit, it yields a very beautiful prospect both from the land and sea. Their wines, raisins, oranges, lemons, almonds, figs, and other fruit are well known, from the large quantities imported to England, besides those sent into other parts of Europe; so that the duties paid to the king are computed to yield annually eight hundred thousand ducats.

This place was in the possession of the Moors seven hundred and seventy-three years, when king Ferdinand took it from them in 1487, after a bloody and obstinate siege of three months. Off Cape Malaga, near this city, the English and Dutch, under Sir George Rooke, obtained a signal victory over the French fleet, commanded by the count de Thoulouse, in August, 1704. This defeat would have been more complete, had not the English just before exhausted most of their ammunition in the taking of Gibraltar, and the Dutch sent part of their squadron to convoy their merchantmen home.

S E C T. X.

Of the Kingdom or Province of New Castile; its Situation, Extent, Produce, and principal Rivers; with a particular Description of Madrid, and the Escorial.

CASTILE is the principal and most opulent kingdom in Spain, and is generally divided into the Old and New; the former being recovered from the Moors some time before the latter. New Castile, of which in regard to the order of situation we shall first treat, is by some called also the kingdom of Toledo, it being the center of the monarchy, and the residence of the king. It is divided on the north by a chain of mountains from Old Castile, and a like chain also divides it to the eastward from Arragon and Valencia, and this side also borders upon Murcia; to the south it is likewise separated by a chain of mountains from Andalusia; and to the westward is bounded by Estremadura. Its greatest extent from east to west is a hundred and eighty-four miles, and from north to south two hundred.

This province has a good air, and is very fertile. The rivers Tagus, Guadiana, and Guadalquivir have their sources in this province. The other most considerable rivers are the Xucar, which runs through Valencia into the Mediterranean; the Xarama, which rises in the mountains of Atiença, and, after receiving the Henares and Tajuna, unites with the Tagus. The Guadarama has its spring head in the mountains of Toledo, and running from north to south through the country falls into the Tagus a little below Toledo. The principal places in this province are the following:

Madrid, the metropolis of all Spain, and the residence of the king, is situated in forty degrees thirty minutes latitude, and in four degrees fifteen minutes west longitude, and stands upon a chain of little hills that are in the center of a large plain, terminated on all sides by lofty mountains, whose summits are always covered with snow. West of the city, where it has neither walls nor moats, it is watered by the Manzanares, which swells in winter by the melting of the snow; but for the greatest part of

the year, particularly in summer, is naturally shallow. King Philip II. however, erected over it a stately stone bridge eleven hundred paces in length, and to the extent of seven hundred it is twenty-two broad. On the south side of the city is a much finer bridge over this little river built by Philip V. called the bridge of Toledo.

The city is large, and contains fifteen thousand inhabitants. It has four hundred streets, a few of them wide and straight, but the rest long, narrow, and so excessive dirty, that, according to some authors, the stench may be smelt at above the distance of a mile. The houses are most of them lofty, regular, and spacious, but partake in some degree of the nauseousness of the streets; they are built of brick, and the best of them with lattice windows, mostly of canvas, or some slight oil-cloth. The rich indeed have them glazed; but take the sashes down during the heat of summer, and put up others in their stead, covered with gauze, or other thin stuff, to let in the air. They in general, however, look more like prisons than the habitations of people at liberty; the windows besides having a balcony, which takes off much of their beauty, being grated with iron bars, particularly the lower range, and sometimes all the rest. A house is generally inhabited by many separate families, who are, notwithstanding, for the most part, strangers to each other.

The city has fourteen squares, among which the large market-place, called the Place Mayor, would be a very fine one were it kept clean, it being four hundred and thirty-six feet one way, and three hundred and thirty one the other; but it is commonly filled with small stalls and provisions. As public shews are exhibited here on extraordinary occasions, the houses that surround it, which are exactly uniform, and five stories high, have balconies and galleries to each story, for the convenience of the spectators; and, as they amount to the number of a hundred and thirty-six, are capable of containing fifty thousand people with ease, they being throughout supported by an arched cloister like that of Covent-Garden, with open walks underneath for sheltering the people from the sun and rain. The houses of the nobility have no courts before them, but stand even with the street; these, with those of the gentry, amount to twelve thousand, all of them spacious and beautiful; those of the grandees are generally built with stone, and adorned within with expensive furniture.

The other principal squares in Madrid are the Sun-market, della Sabada, and that of St. Domingo. The king's palace stands on an eminence on the west side of the city, commanding a delightful prospect of the river Manzanares and the country beyond it; it was burnt down in 1734, but has been since rebuilt with greater magnificence.

Among the other buildings the imperial college of Jesuits is a very noble structure. Some of the convents are fine, particularly that of Atoche, or Our Lady of the Bush; in the church belonging to which they sing Te Deum upon victories and other public occasions. The convent of the Salesas is likewise a new and noble structure.

In this city are the colleges in which are managed the affairs of the government, and also the courts of justice. There are here likewise three academies, one instituted for the improvement of eloquence and the Spanish tongue, another for history, and a third for physic.

Provisions of all kinds are here both excellent and reasonable, and the residence of the court in this city causes a brisk trade and circulation of money: yet foreigners are very much distressed for lodging at Madrid, there being only one tolerable inn, which is the Golden Fountain; and the Spaniards are not fond of taking any strangers into their houses, especially if they are not Catholics. There is no such thing as either a tavern or coffee-house in the whole city, and they have only one news paper, which is the Madrid Gazette. Their places of diversion are the amphitheatre, built for the exhibition of the bull-feast, as it is called by the Spaniards, which has been already described, and the two theatres of *la Cruz* and *del Principe*. The noise by the itinerant bodies of psalm-singers in the evening is very disagreeable; the frequent processions, particularly those of the host, are troublesome; especially

at Easter, when the sight of those bloody disciplinants, the Flagellantes, is extremely shocking. In short, there is no passing the streets of Madrid commodiously without a vehicle; for as they practise, says Mr. Clarke, the Edinburgh custom of manuring the streets by night, they would be too offensive to your feet, as well as your nose, without a chariot by day.

Madrid is governed by a principal officer called the *corregidor*, who is something like our lord mayor, tho' he is not chosen by the city, but by the king, and is not a merchant or tradesman, but a gentleman well versed in the law. He acts as a superior judge, and has under him forty-one *regidores*, not unlike our aldermen, who compose his council, acting as inferior magistrates under him.

At the end of the city is a famous place for airing and recreation, called the Prado or Pardo de St. Hieronymo, a delightful plain shaded by rows of poplar-trees, and adorned with twenty-three fountains, from which it is sprinkled every evening when the nobility and gentry repair thither in their coaches, or on horseback.

At the extremity of the Prado is the palace called Buen Retiro, or the Good Retreat. This, Mr. Clarke observes, is a very indifferent quadrangle, and is not so good a royal mansion as St. James's. It was designed as a place of retreat for the king, from the hurry of the court and town. It, however, contains a great number of stately rooms and noble apartments, adorned with the most costly furniture and paintings, executed by the greatest masters; but it is only built of brick. The gardens are said to be a perfect paradise, and abound with the most delightful shady walks, water-works, and the most curious productions of art and nature; among the former is an equestrian statue of king Philip IV. very finely executed in bronze, standing on a marble pedestal. On the canals are pleasure-boats, and some summer-houses, in which the musicians play, while the king amuses himself on the water. At the entrance of the outer-court are the king's stables, in which are a great number of horses and mules. Contiguous to these is the armoury, a spacious handsome room filled with curious suits of armour formerly worn by the kings of Spain. The outer-court of the palace just mentioned is a large square, with cloisters on both sides, the stables and armoury fronting the palace.

Casa del Campo is a royal seat standing on the other side of the river, to the west of the city, directly facing the king's town-palace, and was a very delightful place with a fine park, but is now much neglected. Florida is another royal pleasure-house, seated near the former in an enchanting situation.

The palace of Aranjuez, about thirty miles from Madrid, has a fine front, and is agreeably situated in a pleasant vale at the confluence of two rivers, the Xarama and the Tagus. Though the gardens are only a dead flat, and the walks plantations of trees in straight rows; yet there is something chearful and refreshing in this cool and shady spot.

St. Ildephonso is a palace about sixty miles from Madrid, in a delightful lonely country; part of it is also a convent. The building is not grand, nor in a good taste; but the gardens are very fine, and the fountains the noblest in Europe. The gardens are said to have cost five millions sterling. Here king Philip V. retired on his resignation of the crown in the year 1724, and caused the relics of some saints, which were highly revered, to be brought from the Escorial into this chapel.

We now come to the palace, or convent, of the Escorial, so called from the village in which it stands, which is situated seven leagues to the north of Madrid. Philip II. the founder of this palace and the convent belonging to it, made a vow at the battle of St. Quintin against the French, on the frontiers of Picardy, to build a convent at the Escorial for monks of the order of St. Jerom, which he preferred from his being obliged to cannonade a convent of Jeromites during the siege of St. Quintin. The battle being gained on St. Laurence's day, he called the convent after the name of that saint; and as he was burnt upon the gridiron, this prince immortalized the very manner of his martyrdom; for he not only stuck gridirons, either of paint, wood, metal, or stone all over the convent, but built the very convent itself in the form

of a gridiron. That part of the building which forms the palace is the handle of this gridiron, and the rest being divided into a great number of square courts, the buildings are so ranged as to form the sides and bars. But in building this structure he gave great disgust to the Spanish cortes: for Philip having assembled them to ask supplies for carrying on the war against France, the states very freely voted a large subsidy of some millions; which the artful monarch, as soon as he had once secured in his own coffers, applied to the building of this convent. This misapplication of the public revenues gave such vexation to the cortes, that they afterwards assembled with more reluctance, being unwilling to be cajoled out of their money by the tricks of designing princes.

This royal monastery of St. Laurence is built on the declivity of a mountain, part of the Segovian chain, which separates the two Castiles. It is of a beautiful white stone, veined with blue and brown, of a very fine polish, and is surrounded with the most delightful prospects. The length of the front from east to west is five hundred and eighty feet, and at each extremity are two ranges of buildings that extend backward four hundred and thirty feet, and then are again joined by another front of the same dimensions as the former; so that it consists of four fronts, and at each angle is a tower. The principal front has three gates, of which that in the middle is supported by four Doric columns of speckled marble on each side, and over them are others of the Ionic order. Above the portal is a beautiful statue of St. Laurence, of white marble, fifteen feet high, dressed in the habit of a deacon, with a book in his left hand, and a large gridiron of bronze in his right. The number of windows in this front is two hundred and forty-seven.

After passing the principal gate you enter a portico that extends from the college to the convent; over it is the library; and in the front are three noble arches leading into a grand court, where the eye is struck with the magnificent frontispiece of St. Laurence's church, on each side of which is a lofty tower, and in the centre a dome. It has five grand arches that form the entrance into the vestibule, and on the lower part of the portal are six large statues, placed on pedestals, of David, Solomon, Hezekiah, Josiah, Manassah, and Jehosaphat, with crowns of gilt bronze on their heads, and sceptres in their hands.

The whole structure is supported by four strong square pillars round the centre of the church, forming four grand arches. Every pillar has two altars, and two niches over them; and in the niches of the pilasters along the walls, on both sides, are altars answerable to the others. Besides these, the whole circuit of the church is surrounded with very elegant chapels, and over these are galleries with brass balustrades extending quite round. The cupola is encompassed by two galleries, and crowned with a lantern, that has eight windows divided by pilasters gradually diminishing to the top, where there is another small dome on the crown of the lantern; and over this a fluted stone obelisk, on the top of which is a globe of gilt brass, with a cross and vane. The doors are nine in number, and over the arches of the principal of these, and on the great altar, are twelve crosses, of a very beautiful red jasper. The altars amount to forty, all of which are richly adorned with carved work, and innumerable paintings, many of them by the greatest masters.

You next view the great chapel, the ascent to which from the church is by twelve steps of red jasper. The pavement of this chapel consists of Mosaic work of jasper and marble of various colours, ranged in the most beautiful compartments. The altar-piece is adorned with all the orders of architecture, except the Tuscan. You first see six Doric columns, in the middle of which the tabernacle is placed, and in the compartments of the other columns are several paintings of sacred history. Their bases and capitals, with those of all the other columns and pilasters behind them, are of brass gilt, and the shafts are of jasper fluted and beautifully polished. At the two extremes are niches, containing the statues of four doctors of the church in gilt brass, which has a fine effect, the jasper of the niches being green. In the spaces on each side of the tabernacle are two pieces of painting, the

the one of the Nativity, and the other of the Eastern Magi worshipping the Infant Jesus.

The second range of columns is of the Ionic order, inlaid with green in the compartments; and in the extreme intercolumniations are niches of green jasper, containing the statues of the four Evangelists, of the same materials and beauty with the former. The principal picture over the tabernacle represents the martyrdom of St. Laurence, by Peregrino; and in the side compartments are our Saviour bound to the pillar, and his carrying the cross, by Zuccaro.

The third range consists of only four columns of the Corinthian order, the extremes of the lower rank being supplied by two pyramids of green jasper, between which are fine brass statues of St. James, the patron of Spain, and St. Andrew, both larger than the life. The history in the middle represents the Assumption of the Virgin, those on the sides are the resurrection, and the descent of the Holy Ghost.

Two columns of the Composite order support the frontispiece, which terminates in the principal arch of the chapel. The compartment is green jasper, in which is a crucifix of brass gilt, with the statues of the Virgin Mary and St. John standing on the sides, and those of St. Peter and St. Paul on the extreme pedestals. The whole height from the pedestal of the Doric order to the centre of the grand arch is ninety-three feet, and the breadth forty-nine. The above tabernacle stands on a pedestal of jasper, within an arched portal, whose pilasters are of red and green jasper. The form is globular, and the order Corinthian. The materials are all gems, and gilt brass. The first pedestal is of jasper finely inlaid. It supports eight jasper columns of a deep red veined with white. In the intercolumniations are four niches, with as many statues of Apostles. Over the cornice is another base, with eight pedestals supporting the like number of statues in gilt brass: it also sustains the cupola, which is divided into four compartments inlaid with jasper. Above is a small lantern crowned with another cupola, and over all is an image of our Saviour of the same metal as those of the Apostles. In the lower part are two doors of rock-crystal leading into the sanctuary, the jambs and lintels of which are of a beautiful green jasper; the other parts consist of jasper of several colours and polished brass. In short, this whole chapel is adorned with the richest Mosaic work, and a great variety of statues and paintings.

The other chapels and all the different parts of this superb church are adorned in the most beautiful manner, columns of jasper, the richest kinds of marble, and most beautiful paintings and statues are every where to be seen.

The convent consists of five beautiful cloisters; and may be entered from the church. The principal cloister is as large as the other four; it extending two hundred and seven feet from east to west, and two hundred and ten feet from north to south. The grand stair-case is forty feet broad; the steps are of the most beautiful stone, each of one piece, and the balustrades of exquisite workmanship. The arcade above is adorned with painting, exhibiting the founder's motives for erecting this edifice, and the whole structure is adorned with the works of the most celebrated Spanish and Italian painters.

In the gallery of the royal apartments are excellent paintings by Bafan; and along the wall are represented two curtains hanging down from the hooks so naturally, that the spectators often endeavour to lift them up. On these curtains are painted the battle fought by Don John II. against the Moors of Granada, in the plains of Higuernala, and the battle of St. Quintin; and at the two extremities are two naval victories gained off the isle of Tercera.

In the south saloon are two doors of inlaid work brought from Germany, extremely beautiful, and the inside is adorned with a number of exquisite paintings. The next is the apartment in which king Philip II. resided, and where he died: here the furniture, ceilings, and walls are plain. It is, however, adorned with small statues of saints, some very beautiful pictures of the Virgin Mary, and other religious pieces. From this apart-

ment is a passage to the queen's, which is of the same construction. The monks here have a higher opinion of Philip II. the founder, than even of St. Laurence and St. Jerom: this indeed is only a decent part of gratitude; for as he thought that, by raising this superb fabric he should atone for all his sins, so he spared no expence to render it complete. It cost during his reign twenty-eight millions of ducats, which is about three millions three hundred and sixty thousand pounds sterling. He lived here chiefly during the last fifteen years of his life; and when he died, ordered himself to be brought out in his bed to the foot of the high altar, that he might die in sight of it; and thus he expired. The place where his bed was placed is since railed off, as sacred. However, some are so superstitious, says Mr. Clarke, as to believe that his unquiet and perturbed spirit still nightly visits his favourite mansion, and stalks horrid round the long arcades and corridors of the Escorial. "For a certain princess, to my knowledge," he adds, gave orders last October, that the guard should "patrole in the night round the cloisters, to see if Philip II's ghost really walked there or not."

There are two libraries in the Escorial, one upon the first floor, and the other upon the second: that upon the first floor is a fine arched room a hundred and ninety-five feet long, thirty-two broad, and thirty-six in height; and the pavement is of black and white marble in beautiful knots. The concave part of the ceiling is finely painted by Pelligrino, exhibiting Divinity, Philosophy, Grammar, Logic, and all the other sciences, surrounded with proper groups of figures. This library contains all the printed books, except some first editions which are kept above. The library above stairs is supposed to be one of the noblest collections of manuscripts in the world, there being eighteen hundred and twenty-four volumes of Arabic manuscripts only; Greek manuscripts in profusion, in folio and quarto, of very great antiquity, yet fair and legible. But all this wealth is deposited in the hands of a few illiterate Jeromites, who are as jealous of these treasures as if they understood their true value.

The last part we shall mention of this superb structure is the Pantheon chapel, the sepulchre of the princes of Spain. The portal is one of the finest pieces, in the composite order, in the world. The principal members are of black marble, regularly veined and spotted with white. In the lesser parts gems, gold, silver, and bronze, unite their lustre. On the sides are two pillars in relievo, with their bases and capitals, besides the jambs and lintels, formed out of one block of marble. Over this is the frieze, and figures to the number of ten, supporting the crown. The pedestals, capitals, &c. are of brass gilt; and before the door is a balustrade of gilt brass, of most beautiful workmanship.

From this portal you descend a stair-case composed of the finest Tortosa jaspers and Toledo marble, beautifully variegated, finely polished, and joined with such art as to appear only one single piece, sixty-four feet in length, consisting of thirty-four steps, divided into three flights, by the like number of landing-places. The balustrades are of beautiful jasper marquetry, with marble mouldings. In the middle hangs a gilt lustre with six cornucopias. At the third landing-place is the Pantheon door, adorned with four pilasters, two of jasper, and two of bronze. The pavement between the pilasters is of polished jasper, and the ceiling represents Jacob's ladder.

Upon entering this august cemetery, you are struck with the beauty of its several parts. The order of its architecture is the composite. Its circumference is one hundred and thirteen feet, and the diameter from wall to wall is something more than thirty-six feet; the height from the pavement to the central stone at the top is thirty-eight feet, and its figure is perfectly circular. The pavement represents the figure of a star, the rays of which are formed of innumerable gems, jaspers and different kinds of marble, with a fleuron in the center, glittering with gems. The whole is surrounded with a beautiful pedestal or base, on which stands sixteen fluted Corinthian pilasters of jasper, the bases and capitals of gilt bronze. The sarcophagi or coffins are placed in niches all

all round the Pantheon; and the marble of which they are made, is remarkable for the fineness of the grain, the beauty of the colour, and the ornaments bestowed on them.

The ring in the ceiling, in the middle of which is the key-stone, forms a splendid fleuron, eighteen feet in circumference, and is of brass gilt, and the design and workmanship very fine. From this fleuron hangs a large iron-rod, to which is fastened a large gilt lustre of beautiful workmanship. At the lower end are the four evangelists in demi-relievo; over these are twenty-four cornucopias, along the edges of which are cherubins; and above these eight angels holding flambeaus; and the other eight are fixed to the heads of as many seraphs. It is every where embellished with festoons, &c. and surmounted by a splendid crown. When the tapers in these cornucopias, the flambeaus held by the angels, and the candles on the altar are lighted, no words can express its grandeur.

On the right-hand, going out of the Pantheon, a door opens into a vault which may be called the secondary Pantheon, where those of the royal family who are not entitled to a place in the principal structure are interred. On every side are three rows of niches, to the number of fifty-one, for the coffins; and on the wall next the door is an altar-piece, in which is a good copy of Christ on the cross, from Titian. Leaving this monastery, we proceed to

Toledo, an ancient fortified city, situated in the fifty-ninth degree forty-six minutes north latitude, and in the fourth degree twenty minutes west longitude, and stands on a steep and craggy rock, encompassed by the Tagus, in the form of a horse-shoe, over which it has two stately bridges. The land-side is fortified by a double wall, in which are one hundred and fifty towers, and five large gates, besides posterns. It was formerly esteemed a place of strength; but in the last wars about the succession, it always submitted to those who were masters of the field. The plain around the city is spacious, fertile, pleasant, and so well watered by the Tagus, that it produces corn, wine, oil, fruit, and in short every thing that can contribute to the convenience and delight of man. The air is particularly serene and healthy, and there is plenty of provisions, which are very cheap. Here reside many noble families, besides gentry, learned and religious persons, merchants, trades-people, and artificers, especially in the silk and woollen manufactures, which two branches alone are said to have employed ten thousand hands; but at present they are much declined.

The city is divided into twenty-three wards, and has twenty-seven parishes, about twenty chapels, thirty-eight monasteries and nunneries, four grand houses of retirement for women, two large colleges, and twenty-five hospitals, one of them for lunatics.

The streets are narrow and steep; but there are no less than seven squares or market-places. There is here a magnificent and spacious old palace taken from the Moors, the stables of which can hold at least five hundred horses.

The cathedral is a large Gothic structure, rich in carving, but the building is neither light, nor in a good taste. It is three hundred and eighty-four feet long, one hundred and ninety-one broad, and one hundred and seven high, all of white stone. The roof is supported by eighty-eight lofty pillars, which divide it into five lesser, the middlemost of which is very handsome, it being divided into two choirs neatly carved and inlaid. One of them is called the chapel of the Blessed Sacrament, and is the burying-place of many of the Spanish monarchs. It is enclosed with costly iron-grates on bases of jasper; and on each side stands a brass pulpit on pillars of the same metal. The other choir belongs to the canons, closed in after the same manner, and beautified with carvings in wood and jasper. All the outside of the two choirs is adorned with statues in niches, and other sculpture representing the history of the Old and New Testament. There are in this structure thirty-four chapels, and the entrance into it is by eight large brass gates, with magnificent porticos; and above is a lofty tower with a ring of bells of a prodigious size. The treasury is of an inestimable value; the vestments for the priests,

and the utensils, are of the richest materials and finest workmanship. The image of the Virgin Mary here has a garment covered with pearls; and the paintings in this structure are answerable to the rest. The ceiling of the vestry is painted by Luca Giordano, and is indeed fine and well preserved. The custodia, jewels, and precious stones, are inconceivable, as well as inestimable: altars, with steps to them of massive silver, gilt; the figures of the four quarters of the world, each adorned with the precious stones peculiar to its own quarter, and sitting on globes of two feet diameter, the globe resting on a pedestal, and that on a base; the figure, globe, pedestal and base, being all together ten feet, and said to be all of massive silver, were the gift of Charles II's queen. In short this is one of the richest cathedrals in the universe, and the archbishopric, both in power and revenue, the greatest next to that of Rome; so that the late queen of Spain obtained it from the pope for one of her sons, though a minor. The lands for the repairs of the church are said to bring in annually thirty thousand ducats, and for the dignatories and canons two hundred thousand more. The whole number of persons belonging to the cathedral, is said to amount to six hundred.

The remains of the alcazar, or palace built by Charles V. or according to others, by the archduke Charles, appear very noble; but it was burnt by the allies and Austrian party in the partition or succession war, lest it should fall into the hands of Philip V.

There is also a very great curiosity at Toledo, which is an original Hebrew temple, and is a fine piece of antiquity; but the piety of the Spaniards in converting this temple from Judaism to Popery, has taken away much matter of entertainment to the antiquarians. The ancient divisions have been all taken down; the holy of holies, and even the tabernacle itself, have been literally done away. The walls, it has since been found, were covered with the Psalms in Hebrew characters; but the Spaniards had zealously plastered them over; but a gentleman of parts and learning, who is canon and treasurer of the church, has lately caused the plaster to be carefully removed. There are also the remains of a Roman circus and amphitheatre.

The Castilian language is spoken here in its utmost purity. One of the greatest inconveniences of this city is, the inhabitants having no water but what is brought from the Tagus, or saved from the eaves of their houses, when it rains. There is here a remarkable common sewer, which is said to run under every house, to carry off all the soil into the river. Besides the above structures, there is here an university founded in the year 1475, and a court of inquisition. The city is populous, and carries on a great trade in fine sword-blades, wool, silk, and stuffs.

S E C T. XI.

Of the Kingdom or Province of Old Castile; its Situation, Extent, Rivers, and Produce; with a Description of Avila, Segovia, Valladolid, and Burgos.

OLD Castile is bounded on the north by the Asturias and Biscay; on the east by Navarre and Arragon; on the south by New Castile; and on the west by Leon. Its figure is very irregular, and consequently its dimensions extremely different; however, its greatest length from Valladolid to Tarragona, is about one hundred and twelve English miles, and its greatest breadth about one hundred and eighty.

Its principal rivers are the Duero and Ebro, the first of which is joined by the Atayada, the Andaja, the Arebarillo, and the Pisuerga, which also receives the Arlanza and Arlançon. The sources of all these rivers are in this province, which is mountainous and less fertile than New Castile. The most fruitful part is a tract called la Tierro de Campos, which lies to the north, near Medina de Prio Seco. The wine produced here is excellent; the plains are covered with cattle, particularly with sheep, which yield the best wool in all Spain. It was formerly only a country subject to the kings of Leon;

but in 1016 was erected into a kingdom. The most remarkable places in this province are the following:

Avila, or Avila del Rey, forty miles to the east of Salamanca, is an ancient city, seated on a fine plain environed with mountains, and producing excellent grapes and other fine fruits; it is surrounded with a wall, on which are eighty-six towers, and ten gates. It has nine parish churches, as many monasteries, seven nunneries, eighteen chapels, two colleges, nine hospitals, and an annual charitable donation of ten thousand ducats given by the city, for maintaining poor orphans and other needy persons. The royal castle stands on a rock, and is provided with a garrison and artillery.

The city of Segovia is of great antiquity, and still a considerable place. It stands high between two hills, and is large, populous, and handsome. It has excellent manufactures of cloth and paper, and also exports a very fine sort of wool. The number of families in this city, amount to at least four thousand. It has twenty-seven parish churches, thirteen monasteries, eight nunneries, five hospitals, three chapels, seven squares, and forty-three streets of the first rank, beside a great number of lanes.

The cathedral is a noble structure, in the Gothic style of architecture, and has two choirs, as it were surrounded by a most ample basilica, which is lined on the wall-side with a vast variety of fine altars, and rich shrines. The painted glass is good, and gives a dim religious light. The sacristy is a fine room, and contains some paintings. There is an old cloyster adjoining to the cathedral, in which are hung up some hundreds of vestments, the badges of so many unhappy Jews, who had the misfortune to be burnt, because they did not believe all that the inquisitor did. The inquisition, or the holy office, as it is called, was then at Segovia, but has been since removed. In this cathedral is a grant of queen Urraca, which mentions the Alcazar, or royal palace; and, according to the Rev. Mr. Clarke, is concluded in the following impious manner: "Whosoever shall violate this grant, let them be ever banished from God's throne, and be eternally tormented with Dathan and Abiram, whom the earth swallowed; be damned with the traitor Judas, and pay a thousand pounds of unalloyed gold to the bishop."

There are several fine churches besides the cathedral; that of St. Milan is very old. The arches of this church are all round and large; and the pillars, which are lofty, have carved capitals, containing many figures both of men and animals; some with beautiful foliage: the shafts are round and plain, placed upon square bases extremely large. At the entrance is a sort of alcade, with beautiful small columns of black marble, and the pillars joined to one another by a sort of spiral line.

The church of St. John the Baptist is said to be the oldest in the city, it being built in 923. It consists of three naves, all round arches of the old Gothic, and here the archives of the city are kept in a handsome chest. The cornice is composed of the heads of animals, the capitals of the pillars carved with animals and human figures, and the windows are small, long, and narrow.

The Alcazar, or royal palace, is supposed by Mr. Clarke to have been built in the eighth century. The front is about fifty feet long: there are two conic turrets at each wing; and the façade is adorned with several diminutive turrets in the same style; above the skilling or span-roof of the first front, there rises another skilling-roof adorned with turrets in the same style; and between the wings in the middle rises a lofty square brick tower, surrounded with small circular turrets ending in a console. Along the front of the first building runs a neat, small, open gallery, just under the cornice. The whole of the fabric appears to be in the old Moorish style, and is extremely pretty and light. You go to it through a sort of a court, over a small bridge; it being on one part encompassed by a deep foss, and on the other sides by steep precipices, it standing on a rock. Having passed the bridge, you enter a cloyster, where there is a court within and a fountain, and having passed through a large hall, enter into a state-room, with a rich ceiling, carving of stucco upon the walls, and Dutch tiling round the room at the bottom. This brings you to a second apartment in much the same taste, but a much richer

ceiling; then you enter a magnificent room, called the Hall of the Kings, it containing the wooden or waxen images of nineteen kings of Castile, six of Leon, two of the Asturias, and sixteen of Oviedo, all placed over your head, about the middle of the wall, round the room, with their queens, and four counts, or dukes, placed under them. Round all the rooms are inscriptions containing prayers and pious sentences; in old Gothic characters.

This is the famous tower or castle of Segovia, so celebrated in Gil Blas and other romances, the ancient receptacle of state prisoners. There is another large prison in the middle of the city; but that is only for common felons.

The Placa Mayor is a very tolerable irregular square, but the buildings are in the old Spanish style; and tho' wood is scarce, and cracks with the sun, the fronts of most of them are of deal, and most miserable buildings.

This city has a famous university: it is the see of a bishop, who has an annual revenue of twenty-four thousand ducats.

The town-house is a good modern structure; but the city, upon the whole, has a strange appearance: the buildings look wild and odd, sometimes being raised upon the uneven and craggy parts of the rock, and consisting of all the styles of architecture, Roman, Gothic, Moorish, Saxon, and Spanish.

But what is most worthy of notice among the buildings of this city, is the Segovian aqueduct, which extends to a small river, called Rio Frio, which rises in the skirts of a pass in the mountains, and takes from it as much water as would fill a duct that would contain a human body. It is received into an arch of stone, five hundred paces from the city; and from thence begins to run in the channel of the aqueduct, which does not require more elevation than seventeen feet. By little and little, the height increases as it comes to deeper ground, but without requiring more than one range of arches, till the water has passed over sixty-five arches, where the arches have a height of thirty-nine feet, close to a Franciscan convent. There they begin to wind from east to west, requiring two ranges of arches, one arch being put upon the other; that being the lowest part of the valley, which is the little square, now called Azoguejo. In that part the aqueduct is one hundred and two feet high; the channel entering by the battlements of the walls, with an extreme elevation from the ground to the top of the arch. The aqueduct goes through the middle of the city, from east to west, with an arched duct so large, that a man may walk in it: and from thence dividing, it extends to the public fountains, and the cisterns of convents and private houses. This structure consists of one hundred and sixty-one arches, of hewn stones of a bluish granite, placed one upon another. This was doubtless built by the ancient Romans, and some attribute it to Trajan. In two niches on the highest part was formerly statues of Hercules, which are now changed for those of our Lady of St. Sebastian.

In this city is fixed the principal mint of all Spain, which, when at work, can coin thirty thousand ducats in a day. Here they make good paper; but the woollen manufacture of this city is the best and most considerable in all Spain; the blankets of Segovia are, perhaps, the finest in the world; for they have a vast quantity of the finest wool, produced from the numberless flocks bred in the neighbouring plains. Here are also several other manufactures, particularly of linen, which is carried on with great success.

Valladolid, anciently called Pindia, is a large, beautiful, and populous city, eighty-six miles to the north-west of Madrid. It is situated in a spacious and delightful plain, watered by the Pisuerga, over which it has a stately bridge: besides which, it has about nineteen small ones over the Esquera, a small river that runs thro' several of the streets, and thence through a delightful landscape of gardens, orchards, meadows, and fields, which it waters in its course. The city is walled round; but is a place of no great strength, and has six gates. It has long broad streets, with large and lofty houses, splendid palaces, spacious and elegant squares, and fountains; seventy convents, among which the Dominican convent

of St. Paul has a magnificent church, and the college of St. Gregory, and that of the Jesuits are particularly worthy of notice.

The great square, or piazza, is built after the model of that at Madrid, and consists of five hundred arches with gilt balconies, three thousand windows all in view, and three hundred and thirty gates or doors. It is in circuit seven hundred paces, and is capable of containing thirty thousand persons. Near one side of this square is a large well-built street, chiefly inhabited by gold and silversmiths.

Here is a royal palace, near the Dominican convent; an university, founded in 1346; a geographical academy, lately erected; a court of inquisition; and a tribunal of justice, composed of one president, fifteen counsellors, four criminal judges, one supreme judge for Biscay, four judges of nobility, two fiscals, and an alguazil mayor; yet the revenue of its bishop, who is suffragan to the archbishop of Toledo, does not exceed twelve thousand ducats per annum.

The inhabitants of Valladolid are as polite and well-bred as any people in Spain. They not only carry on a considerable trade abroad, but cultivate several manufactures at home, in which they are very expert and ingenious.

Burgos, the capital of Old Castile, stands on a hill between the rivers Alanzo and Arlanza, and is encompassed with mountains. It is situated in forty-two degrees thirty minutes latitude, and in four degrees five minutes west longitude, one hundred and ten miles to the north of Madrid. It has old but strong walls, seven gates, and has a good bridge over the Arlanza, and on the north-side is a castle seated on a steep rock. The air is here so disagreeable, that the Spaniards have a proverb, that Burgos has nine months of winter, and the other three of hell; the former meaning rainy and cold weather, and the latter excessive heat. This city is large, but irregular, and most of its streets are narrow and crooked. It has, however, many fine squares, public buildings, and noblemen's houses. This city has fifteen parish churches, with five hospitals, six chapels, a college, ten monasteries, and nine nunneries, one of which is the royal foundation of Huelgas, of the order of St. Bernard; its lady abbess is a woman of the first quality, and next in rank to the royal family; she having seventeen monasteries, sixteen towns, and fifty villages subject to her. In this abbey are one hundred and fifty nuns, all gentlewomen; and its revenue amounts to eighty thousand ducats a year. The convent of St. Augustine has what they term a miraculous crucifix, which they pretend was made by Nicodemus.

The cathedral, which is one of the noblest and richest in Spain, has five large choral chapels, with an organ in each, yet so inclosed and remote, as not to disturb each other. The archbishop has a revenue of forty thousand ducats a year. Bega, one of its suburbs, exceeds it in convents and hospitals. The inhabitants of both sexes are here more industrious, and carry on a greater number of trades and manufactures, than is common in the large cities of Spain.

S E C T. XII.

Of the Kingdoms, or Provinces of Navarre and Biscay; their Situation, Extent, Produce, and Rivers; their History, and Principal Cities.

NAVARRÉ, which to distinguish it from the country of the same name belonging to the French, is called Upper Navarre, is bounded on the west by Old Castile and Biscay; on the south by Arragon; and on the east by Arragon and the Pyrenean mountains, which divide it from French Navarre; and also by the same mountains towards the north. It is an hundred miles in length, and about sixty in breadth; it is mountainous and colder than the rest of Spain; and as the greatest part of the province lies among the Pyrenean mountains, its chief wealth consists in cattle. Hence it produces very little corn, wine, or fruit; but has abundance of excellent timber, and some iron-mines. The

mountains also abound in game of all kinds, as bears, stags, roe-bucks, wild-fowl, &c. It is watered by three rivers, all of which fall into the Ebro; these are the Arga, the Ega, and the Arragon, which issues from the kingdom of the same name.

The king of Spain receives no revenue from this country, all the imposts and duties being by compact to be employed in the public services. Navarre, from the year 718 to 1512, had its peculiar kings of different families; but in the last mentioned year, was reduced by king Ferdinand the Catholic, under the idle pretence that John D'Albert, its king, by being an ally of Lewis XII. of France, with whom pope Julius II. was at variance, had been declared an enemy to the church, and excommunicated by the pope.

Pampeluna, anciently Pompeiopolis or Pompelo, from its being built by Pompey the Great, is the capital of Navarre; and is seated on a plain near the Pyrenees, by the river Arga, one hundred and sixty seven miles to the north-east of Madrid. It is a place of tolerable extent, and has two castles, one within the city, and the other without, on a rock. Its squares are handsome, and adorned with shops full of rich merchandize. Its bishop is subject to the archbishop of Burgos, and has an annual revenue of twenty-five thousand ducats. It has also an university, founded in the year 1608, and is the residence of the viceroy of Navarre.

The province of Biscay is bounded to the west by the Asturias; to the northward by the sea, which is here called the Bay of Biscay; to the east by Navarre; and to the south by Old Castile. Its extent from north to south, is between eighteen and seventy-five miles, and from east to west one hundred and eight.

The air here is mild and temperate; but the soil is stony and uneven, so that in some places hardly any thing grows; but in others they have a little wine, called chacolino, which is pleasant, and drank as small-beer. They have corn sufficient for the use of the inhabitants, and have apples in great plenty, of which they make excellent cyder, which in some measure supplies the want of wine. The coast also abounds with oranges and lemons, which they sell very cheap, and in the forests is excellent timber fit for ship-building. The mountains yield mines of iron and lead; while the valleys produce some flax.

Its commodious situation on the sea, in the neighbourhood of France, renders the trade very flourishing: they particularly export great quantities of iron-work, with all sorts of powder and fire-arms, which are very neatly finished, and a great deal of tar. Here they ship off large quantities of wool, which is mostly brought from Old Castile: but their own produce in this last article, being neither so fine, nor produced in such quantities, they manufacture wholly at home. The sea also furnishes this province with all kinds of excellent fish.

The natives of Biscay are of Celtic extraction, and like their progenitors, generous, brave, hardy, choleric, active, and of few words. They are also reckoned the best soldiers and sailors in Spain, and enjoy many privileges, of which they are extremely jealous. They have a particular language of their own, called the Basque, or Biscayan, that has no affinity with the other European tongues, and there are few who do not speak it readily; having preserved this, with their genius, ancient laws, government, and manners, without innovation.

Till the year 859 the Biscayans were governed by counts, or governors, sent them by the kings of Oviedo and Leon; but under the latter they revolted, and chose themselves a chief, which they retained till they were subdued by Peter the Cruel, who, under the title of a lordship, united Biscay to Castile.

This province contains the three following subdivisions, Biscay Proper, Guipuscoa, and Alaba; the principal places in which are the following:

Bilboa is a corruption of Bello Bado, and signifies a fine ford, one lying near it. It is the capital of the province, and is seated in a plain environed by high mountains, six miles from the sea, in latitude forty-three degrees thirty minutes, and in three degrees ten minutes west longitude. The tide which flows up here into the river Ybañabal, the antient Nervius, forms a secure harbour, which is very much resorted to; small vessels

coming up to the mole, while those that are larger lie farther out in the road. The greatest export of this place consists of fine wool and excellent iron, most of the latter in bars, though great quantities of it are wrought into swords, fire-arms, and other military implements; they also export saffron and chesnuts. This city is large and populous; it has a bridge over the river, and contains twelve hundred houses, five parish-churches, the like number of monasteries, and seven nunneries. It has a good air, and is surrounded by a fruitful country, whence provisions are plentiful and cheap.

There is also in this province Ordunna, a sea-port city, seated in a pleasant valley formed by high mountains, twenty-five miles to the south-west of Bilboa, and two other small towns.

Guipuscoa, the second subdivision of Biscay, runs along the coast of the north bay, and is bounded to the westward by Biscay Proper, and part of Alaba; to the southward by Navarre; and to the eastward by Navarre and France. It abounds in most things, except wheat. The principal places it contains are the following:

St. Sebastian, a city of considerable size, situated in forty-three degrees thirty-seven minutes latitude, and in one degree fifty-six minutes west longitude, has a secure harbour at the mouth of the little river Gummea, and is seated at the foot of a mountain, which serves as a defence to it against the tempestuous sea. The harbour is secured by two moles, between which only one ship can pass at a time. Near its entrance is also a fort defended by a garrison. The town is surrounded by walls defended with bastions and half-moons, and on the mountain under which it lies, is a citadel. The streets are long, broad, straight, and clean; they being paved with white flag stones. The houses are pretty handsome, the churches very neat, and the environs extremely pleasant; one side affording a prospect of the sea, and the other a distant view of the Pyrenean mountains.

A considerable trade is carried on here in iron and steel, which some take to be the best in Europe, and also in wool. This town was taken by the French in the year 1719. In time of war with the English there are many privateers here, and the prizes are generally brought into this harbour.

Fontarabia, or Fuentarabia, is a little neat town, seated on a peninsula on the sea-shore, twenty-two miles to the south-west of Bayonne. It is fortified both by nature and art, and has a pretty good harbour, though it is dry at low water. This town is built in the form of an amphitheatre, on the declivity of a hill, and on the land-side is surrounded by the lofty Pyrenean mountains. It is a very important place, it being accounted the key of Spain on that side.

The young gentlewomen of this city have something particular in their dress; for their braided hair falls on their shoulders, and on their heads they wear a small muslin veil, which flutters about their necks, round which they have necklaces of coral: their garment is a waistcoat with loose sleeves, and they are very alert and active: but this is chiefly to be understood of those who inhabit the adjacent villages.

In 1638 this place held out a siege against the French, for which it was honoured by the king with the title of a city; but in 1719 was taken by them. Near the city runs the river Bidassoa, or Vidosso, which is here very broad, and is the boundary between Spain and France.

Pheasant island, which is formed by the river Bidassoa, and separates France from Spain, is worthy of notice, both on account of the peace of the Pyrenees, which was concluded in 1659, and for the treaty of marriage transacted there between Lewis XIV. and Mary Theresa, the infant of Spain. In 1722 were exchanged at this place the infant Maria Anna Victoria, and Mademoiselle de Montpensier, daughter to the duke of Orleans, regent of France. It is called by the French *l'Isle de la Conference*, and *Isle de Paix*.

Tolosa, the capital of Guipuscoa, is seated between two mountains in a delightful valley, at the confluence of the Araxas and Oria, over which there are two handsome bridges, and at a small distance several fine natural cascades. It is not large, but inhabited by a great number of persons employed in making sword-blades.

The province of Alaba, the last of the three divisions of Biscay, is bounded on the north by Guipuscoa and Biscay Proper, on the east by Navarre, on the south by Old Castile, and on the west by Biscay Proper and Old Castile. It is pretty fertile in rye, barley, and several kinds of fruit, and has also tolerable wine. It has likewise very rich mines of iron.

The capital of this little district is the city of Vittoria, which lies about thirty miles to the south of Bilboa, is seated on an eminence, at the end of a pleasant valley, and is environed with double walls. In the principal square are the town-house, two convents, several well built houses, and in the middle is a fine fountain. The large streets are bordered with trees, which are a good defence against the heat of the sun. The monasteries are magnificent, and the convent of St. Francis is in particular very large. There are here some rich merchants, who carry on a great trade in iron and steel, sword-blades, wool, and wine.

S E C T. XIII.

Of the Principality of the Asturias; its Situation, Extent, Produce, History, and principal Cities.

THE principality of the Asturias is bounded on the north by the bay of Biscay, on the east by the province of Biscay, on the south by Old Castile and Leon, and on the west by Galicia; and takes its name from the Asturians, a Celtic nation, who came hither from Gaul, and whose valour rendered all attempts by other nations abortive. Its greatest extent is about forty-eight miles from south to north, and about a hundred from east to west. The air is tolerable; but the country uneven, rugged, and thinly peopled; yet the soil produces a pretty deal of grain, fruit, and wine. Its horses were antiently very famous, and much sought after on account of their spirit and goodness.

The nobility of this province value themselves on being descended from the Goths, and on their blood not being adulterated by a mixture with that of the Jews and Moors. For after the unfortunate battle which the Goths, commanded by king Roderic, fought with the Moors near Xeres, Pelagius, the Gothic prince, retreated with a considerable number of the nobility into the mountains of the Asturias, where he assembled a small army; but being unable to face the enemy in the field, retired with a thousand brave Goths to a large cave in the mountain of Ausena, and upon the approach of the Moors sallied out and entirely defeated them. The bold stand made by the Goths is still so celebrated in Spain, that all the inhabitants of this mountain enjoy particular privileges; and though they are but peasants, and go in great numbers from this mountain to seek for work in the other provinces of Spain, both great and small give themselves the appellation of illustrious Goths, or illustrious mountaineers; and, amidst their poverty, think it a disgrace for them to marry with the great and rich families of any other race. Indeed they are so highly esteemed, that other families frequently give considerable sums to marry among them. This district belongs to the hereditary prince of Spain, who takes his title from it. It is divided into two unequal parts, and hence arises the name of the Asturias in the plural number.

These divisions are called Asturia d'Oviedo and Asturia Santellana: the former lies to the westward, and is the largest division; and the latter to the eastward.

Oviedo, the antient Brigetum, the capital of all Asturia, and the only place that bears the name of a city, is seated on a plain, in a kind of elevation between the little rivers Ove and Deva, fifty miles to the north-west of Leon. The bishop of this place, who enjoys an annual revenue of twelve thousand ducats, is immediately subject to the pope. The cathedral boasts of possessing a vast number of relics that were brought hither from all parts of Spain, in order to secure them from being taken by the Moors; and here is an university, erected in 1580.

Villa Viciosa, a town seated twenty-two miles to the north-east of Oviedo, and has a good harbour on the bay of Biscay, into which the river Asta discharges itself.

Santellana, in Latin Fanum Sanctæ Julianæ, the capital of the other division, lies ninety-four miles to the west of Bilboa. It is small, has a harbour on the bay of Biscay, with a collegiate church, and gives the title of marquis to the duke of Infantado.

There are several other towns in this province; but they are all of them very inconsiderable places.

S E C T. XIV.

Of the Kingdom or Province of Leon; its Situation, Extent, Produce, Rivers, and principal Cities.

THE kingdom of Leon is bounded on the east by Old Castile, on the south by Estremadura, on the west by Galicia and Portugal, and on the north by the Asturias. Its extent from north to south is about a hundred and sixty-five miles, and from east to west between sixty-seven and ninety-three. The soil in some places produces all the necessaries of life, and particularly very good wine. In this province are likewise mines of turquoise; but a great part of the country is a naked, dreadful, barren rock, except where it is covered with a few pitiful firs or shrubs. "I turned round, says Mr. Clarke, to take a view of Leon from one of the highest mountains, and was almost frightened at the sight; a brown horror, as Mr. Pope expresses it, was spread over the whole; sands, rocks, and craggy precipices formed as savage a prospect as can be imagined."

The principal rivers of Leon are the Pisuerga and the Carrion, which rise in Old Castile; the Esla and Orbego, both which have their sources near the city of Leon; the Torto and Tera, which run into the Orbego; and Formes, or Rio de Salamanca, which, on the frontiers of Portugal, falls into the Douro.

The most remarkable places in this province are the following:

Leon, the capital of the province, was built by the Romans in the reign of the emperor Galba, and called Legio Septima Germanica, from whence it derived the name of Leon. It is seated in the forty-third degree ten minutes north latitude, and in the sixth degree twenty minutes west longitude, between both the springs of the river Esla, and at the end of a large plain bounded by the mountains of the Asturias, fifty miles to the south-east of Oviedo. The bishop, whose annual revenue is twelve thousand ducats, is immediately subject to the pope. The cathedral is famous not only for its beauty, but for its being the burial place of several saints, thirty-seven kings of Spain, and one emperor. This city was formerly both larger, richer, and more populous than at present. It was indeed the first city of any consideration that was retaken from the Moors; Pelagius making himself master of it in the year 722, when he fortified it, and it continued a royal seat till 1029. It contains thirteen parishes, six monasteries, five nunneries, fifteen chapels, and four hospitals.

The city of Astorga, in Latin Asturica Augusta, is situated in a wide plain on the river Astura, or Torto, in the forty-second degree north latitude, and in the sixth degree twenty minutes west longitude, and is well fortified both by nature and art; but neither large nor populous. Its bishop is suffragan to the archbishop of St. Jago, and has an annual revenue of ten thousand ducats. The cathedral is a noble Gothic building, and has a basilica, consisting of six pointed arches, supported by tall, light, neat pillars in a good taste. There are here seven or eight fine altars, and the high altar is exceeding magnificent: it consists of twenty compartments of marble sculpture in alto relievo, the figures as large as the life; the subject is the history of our Saviour; and on the summit is God the Father crowning the Virgin Mary. The glory is well expressed; for being cut through the frame, and a light placed behind it, the light shews the rays. "We happened, says Mr. Clarke, to attend at the vespers; the music of the organ was fine; the number of the tapers, the richness of the altars, and,

"in short, the whole scene was striking." This city was formerly the capital of the Asturias; but it at present only gives the title of marquis to the family of Osorio.

The city of Salamanca is situated in forty-one degrees five minutes latitude, and in six degrees sixteen minutes west longitude: it is of a circular form, built on three hills and two valleys, and on every side surrounded with prospects of fine houses, noble seats, gardens, orchards, fields, and distant villages; and is antient, large, rich, and populous. Its walls are six thousand three hundred and sixty paces in circuit, and adorned with thirteen handsome gates and stately towers. Within the city are a hundred and sixty-two streets, five thousand houses, many of which are magnificent buildings, seventeen squares, twenty-five parish-churches, twenty monasteries, eleven nunneries, two houses of retirement for young women to lead a penitent life, sixteen chapels, six hospitals, and twenty-five colleges. The river Tormes, which runs by it, fertilizes the neighbouring country. The university, which in 1239 was removed hither from Palencia, is the most famous in all Spain. The university-college is a very spacious structure, and near its stately entrance is an infirmary for sick poor scholars: it contains twenty-four other colleges, in each of which live thirty students; and among these the four most considerable are termed the great colleges, and appropriated to persons of rank. Most of the colleges are noble structures and well endowed, and the great public schools, and other buildings, are extraordinary magnificent. The Spaniards term this city the mother of virtues, sciences, and arts.

Roderigo, an episcopal city, which, after its being ruined by the Goths, was, in 1102, rebuilt by Don Roderigo Gonzales Giron, and from him received its name. It was afterwards destroyed in the wars, and rebuilt by Ferdinand II. in order to be a check upon Portugal; it being only about twelve miles from the frontiers of that kingdom. It stands on the little river Agneda, or Agujar, twelve miles from the frontiers of Portugal, and has good strong walls, nine gates, three squares, fifty-four streets, two thousand houses, eight parishes, two monasteries, two nunneries, ten chapels, and three hospitals. The bishop is suffragan to the archbishop of St. Jago, and has an annual revenue of ten thousand ducats. This city is one of the three places of rendezvous for the Spaniards, when they are at war with Portugal.

The city of Zamora is situated on the Douro, over which it has a fine bridge, and stands in a fertile country, thirty-four miles to the north of Salamanca. The Moors gave it the name of Zamora, or Medinato Zamorati, which signifies the Town of Turquoises, most of the rocks in its neighbourhood containing that kind of gems. The bishop of this place has an annual income of twenty thousand ducats, and is suffragan to the archbishop of Toledo. In this city is kept the body of St. Ildefonso, formerly bishop of Toledo.

S E C T. XV.

Of the Province of Galicia; its Situation, Extent, Rivers, Produce, and principal Cities.

THE province of Galicia is bounded on the east by Asturia and Leon, on the north and west by the sea, and on the south by Portugal. It receives its name from the antient Gallazi, the most powerful and numerous of the several nations who inhabited it. Its extent from north to south is about a hundred and twenty-seven miles, and from west to east about a hundred and twelve.

This is the most maritime of all the Spanish provinces, and accordingly enjoys the greatest number of seaports; among which Corunna and Ferrol are the most considerable. Cape Finisterre, one of its promontories, is seated on the west, and is well known to all navigators.

The coasts enjoy a temperate air; but in the inland parts, it is somewhat colder, and very damp. This country is so mountainous, as to admit of few plains, and the sea-coast excepted, is but thinly inhabited; it has

no less than seventy rivers, and smaller streams, the principal of which are, the Minho, the Ulla, the Tamba, and the Mandes.

This province produces little corn; but has plenty of wine, lemons, and flax; it has also very fine pastures. Its forests afford timber fit for ship-building, and the sea abounds in excellent fish. But the universal poverty of the inhabitants induces many of them to seek a living in the neighbouring provinces, where they perform the most servile and laborious employments. Yet for this humble industry, they are despised by the other Spaniards.

This province contains sixty-four cities and towns, but few of the latter are any way considerable.

Bayona, a small town on a bay, which forms a convenient harbour. The sea in this place abounds with fish, and the district of land belonging to the town with fine fruit. At the entrance of the bay lies certain islands, formerly called the Islands of the Gods.

The city of Corunna, commonly called the Groyne, stands on a small bay and peninsula, in the forty-third degree twenty-eight minutes latitude, and in the ninth degree twenty minutes west longitude, sixteen miles to the south-west of Ferrol. The harbour presents you with a fine prospect as you sail into it; on your right are the tower of Hercules, the fort and the town; before you the shipping, terminated by an agreeable view of the country: on your left, you see cape Prior, the entrance of Ferrol, and a ridge of barren mountains, with a large river running between them. The city is divided into the Upper and Lower Town; the former is defended by the castle of St. Diego, the latter stands on a neck of land, surrounded with water on three sides. Thus the city is in form of a half-moon, with a castle at each point. This city is the seat of the royal audience of Galicia, and here the English packet-boats usually come. It has a collegiate church, and in its neighbourhood is a quarry of jasper. In short, Corunna is well built and populous; but, like most other Spanish towns, has an offensive smell. Their method of keeping the tiles fast on the roof of houses, is by laying loose stones upon them.

The poorer sort, both of men and women at Corunna, wear neither shoes nor stockings; but those in better circumstances have a great flapped hat, a cloak reaching down to their feet, and generally carry a sword under their arm; the women wear a short jacket of one colour, a petticoat of another, and either a white or black woollen veil.

Vigo, a town seated on a small bay, one hundred and five miles to the north-west of Madrid, is surrounded by a wall that has some bastions, and defended by an old castle and a fort which stands on an eminence, but is incapable of making a long resistance. This harbour is rendered famous by a sea-fight in 1702, between Sir George Rooke, commander of the English and Dutch fleet, and a squadron of French men of war, with thirteen Spanish galleons under their convoy; when, after admiral Hopson had broke through the boom laid across the mouth of the harbour, the English took four galleons and five men of war, and the Dutch five galleons and one large man of war. Four galleons and fourteen men of war were destroyed, with a great quantity of plate and other rich effects. However, a great deal of silver was taken, though a considerable quantity was carried on shore before the engagement. While this was doing, the duke of Ormond, with a large body of land-forces, drove the Spaniards from the castles which defended the harbour. In the year 1719, the English again got possession of this place, but relinquished it after raising contributions.

St. Jago de Compostella, the capital of the whole province; situated in forty-two degrees fifty minutes north latitude, and in eight degrees twenty minutes west longitude, between the rivers Tamba and Ulla, in a most fertile plain, surrounded with hills of a moderate height, which shelter it from the nipping winds which blow from the mountains. The public squares and the churches are very magnificent; it has also a great number of monasteries for both sexes, and about two thousand houses. The cathedral is particularly worthy of notice, and in it is kept the pretended body of the apostle James the younger, the titular saint and patron of all Spain; which to-

wards the close of the ninth century, they say, was discovered by a divine revelation. This draws a great number of pilgrims thither, who walk in procession to the church to adore his wooden image, which stands in the great altar and is illuminated with forty or fifty wax candles. They kiss it three times with a very respectful devotion, and then put their hats on its head. In the church are thirty silver lamps always burning, and six chandeliers of silver five feet high. Those pilgrims who are poor, are admitted into an hospital that stands near the church, and has galleries of free-stone, supported by large pillars. The archbishop is one of the richest prelates in Spain, his annual revenue amounting to sixty thousand ducats, and that of the cathedral to no less; but out of this sum he pays the king eighteen thousand ducats a year. The order of St. Jago takes its name from this city, which also maintains a certain number of knights. The university was erected in 1532, and there is here also a tribunal of the inquisition.

Orense, a city seated forty-seven miles to the south-east of St. Jago de Compostella, in a delightful country on the banks of the Minho, and abounding in excellent wine and fine fruit. One part of it stands at the foot of a mountain, in which is felt a sharp cold that is of long continuance; while the other part of the city, which lies on the side of the plain, enjoys all the pleasures of spring and the fruits of autumn. This is said to be in some measure owing to the springs, which warm the air with their exhalations. Some of these are so moderately warm, that a person may bathe in them; while the water of others, on the contrary, is so hot that eggs may be dressed in them; but they are both salutary in several distempers. Its bishop, who has an annual revenue of ten thousand ducats, is suffragan to the archbishop of St. Jago.

SECT. XVI.

Of the Province of Estremadura; its Situation, Extent, Climate, Produce, Rivers, and Principal Cities.

ESTREMADURA is bounded on the north by Leon; on the east by New Castile; on the south by Andalusia; and on the west by Portugal. Its extent from north to south is pretty nearly one hundred and twelve miles, and from east to west between sixty and one hundred.

The inhabitants are inured to the air; but the summer heats are intolerable to the foreigners who travel there. Those who live at the foot of the mountains have good water; but the inhabitants in the plains are obliged to put up with what is taken out of pits dug in the ground. The soil abounds with corn, wine, and fruit; and its pastures are so good, that great numbers of cattle are brought hither from other provinces to fatten. The rivers Tagus and Guadiana run quite through the country of Portugal, and in many places are joined by several streams.

The district of Vera de Plazencia, or the Orchard of Plazencia, consisting of alternate mountains and valleys, is extremely delightful, and, next to Andalusia, the most fertile in all Spain. The finest and most delicious fruits and vegetables, with wholesome and odoriferous plants, grow here in the greatest abundance. Here is also excellent wine, fine springs, and pleasant brooks that abound with trout. In short, every thing in this district wears a smiling aspect.

The city of Plazencia, or Placentia, from which the district takes its name, is a beautiful well-built city, sixty-seven miles to the south-west of Madrid: it is seated on an eminence between mountains, on the little river Xerte, and is defended by a good castle. Its bishop, who has a revenue of fifty thousand ducats per annum, is subject to the bishop of St. Jago, and under its jurisdiction are two small towns.

Alcantara, a fortified town a hundred and seventy-two miles to the north-west-by-west of Seville, is seated on the Tagus in a fruitful country, near the frontiers of Portugal, and takes its name, which signifies a stone bridge, from an ancient stately one, built on this river in the

reign of the emperor Trajan; it being two hundred feet high, six hundred and seventy long, and twenty-eight broad. It was taken by the earl of Galway in 1706, and retaken by the French the same year.

Badajoz, the capital of Estremadura, and a frontier town against Portugal, stands upon an eminence on the south side of the Guadiana, and is divided into the Upper and Lower Town. It is not a large place, but has good houses, pretty broad streets, fine churches, some convents, and a jesuits college. The bishop, who has an annual revenue of sixteen thousand ducats, is suffragan to the archbishop of St. Jago. Its fortifications are antique, but it has some wooden out-works, particularly a castle fortified in the modern taste, called St. Michael's; and on the farther side of the river the castle of St. Christoval, which covers an old Roman bridge of stone that extends over the river, and is seven hundred paces long and fourteen broad. On this bridge the Portuguese were defeated by Don John of Austria in 1661, and in 1705, the city was besieged by the allies, but not taken. The neighbouring country is extremely fruitful, and its flocks of sheep produce very fine wool.

SECT. XVII.

Of the Province of Andalusia; including the antient Kingdoms of Seville, Cordova, and Jean. Its Situation, Extent, Rivers, Produce, and principal Cities; with a more particular Description of Seville, Cadiz, and Gibraltar.

THE name of Andalusia, which this province owes to the Vandals, is divided from Vandalenhaus, or the habitation of the Vandals, and formerly extended also over the kingdom of Granada, then called Upper Andalusia. This country is bounded on the north by Estremadura and New Castile, from which it is divided by a range of mountains, called the Sierra Morena; on the east by Granada and Murcia; on the south partly by the Mediterranean, and partly by the streights of Gibraltar; and on the west by the Portuguese districts of Alentejo and Algarve, extending from east to west about two hundred and twenty-five miles; but its breadth is very different, and where largest, not above one hundred and twelve.

The river Guadalquivir, by the antients called Bætis and Tartessus, traverses the whole country, and the Guadiana separates it to the west from the Portuguese Algarve. Of the other small rivers some run into the sea, as the Odier, or Odriel; the Tinto, or Azeche, the water of which cannot be drank, it being noxious even to herbs and the roots of trees, and having neither fish or any living creature in it; and the Guadalate, or river of Oblivion. Others fall into the Guadalquivir, as the Xenil, and the Guadiamar.

Andalusia is esteemed the best province in all Spain, it abounding in exquisite fruit of all kinds, honey, excellent wine, grain, silk, sugar, fine oil, numerous herds of cattle, particularly horses, with metals, cinnabar, and a certain species of quicksilver. The heat in summer is indeed very great; but the inhabitants generally sleep by day, travelling and following their other employments in the night. The air is, however, in other respects good, and is sometimes refreshed with cooling breezes.

This province is properly composed of three antient kingdoms, which, in the king's titles, instead of the common names, are expressed by that of Andalusia. These are the kingdoms of Seville, Cordova, and Jean.

Seville, the antient Hispalis, the capital of the kingdom of the same name, is seated in the thirty-seventh degree fifteen minutes north latitude, and in the sixth degree five minutes west longitude, two hundred miles to the south-west of Madrid, in a large plain on the banks of the Guadalquivir. It is almost round and of considerable extent, but not proportionable to the number of its inhabitants: the streets are narrow, but the houses fine, though in the Moorish taste: they are clean built round a square court, with green lattices, and shaded from the sun by a canvas extending from the top of the houses across the court.

The cathedral is a fine Gothic structure, raised on noble pointed arches, and adorned with good painted glass windows. It consists of five naves; but the whole is spoiled by the skreen of the choir, which intercepts the view of a magnificent altar, and a pretended miraculous virgin at the east end. Before that altar is a sarcophagus of silver, within which lies the body of Fernando Santo. There is much plate belonging to this church; particularly one whole altar and frontispiece of plate, and a most beautiful silver custodia. The tower of the cathedral, which is about forty-four feet square, and upwards of a hundred and thirty feet high, was built by the Moors in the year 1000, with turrets, and a cupola has been added by the Christians, which makes it about three hundred feet to the top of the image upon the dome. The ascent of the tower is so easy, that a horse may ascend to the top, there being no steps. The chapter-house is a fine oval room, and in this structure are many fine chapels.

In this city are reckoned twenty-nine churches, forty-four convents for monks, and thirty nunneries, all which are rich and well-built, twenty-four hospitals, and as many squares. Of the convents, the most remarkable and magnificent are those of the Franciscans, Nuestra Señora de la Merced, and the Dominicans. Its university was founded in 1504. The great college stands near the king's palace. St. Thomas's college was built in the fifteenth century, and the Jesuit's college is also worth seeing.

The royal palace, called Alcaçar, stands near the cathedral, and is very spacious: it was built by the Moors, and has been considerably enlarged by the kings of Spain, but the new works are inferior to the old. Some parts of this vast structure are very grand, but want the conveniencies of modern architecture.

The exchange, which stands behind the cathedral, is a large building. To the suburbs of Triana is a passage over the river, by a strong bridge of boats. The circuit of the city, including the suburbs, is computed at near fourteen miles; but that of the walls is only eight. They are pretty strong, and have fifteen gates, and a hundred and sixty-six towers. Quite along the river are commodious quays, where vessels of a large burthen may lie with safety; and near the water-side is a stately tower, which commands the whole river, city, and suburbs. The archbishop of Seville has a yearly revenue of a hundred thousand ducats. Here are several public offices and a court of inquisition.

This city was once famous for its flourishing manufactures; but these have so dwindled, that from a thousand artificers in wool and silk, scarce four hundred remains at present. The adjacent country abounds in wine, corn, and fruit; great quantities of oil are particularly made here. Without the city is a long Moorish aqueduct, worthy the notice of the curious traveller.

Puerto de Santa Maria, or Port St. Mary's, the capital of an earldom belonging to the duke of Medina Celi, is seated at the mouth of the river Guadalete, directly opposite to Cadiz, and exceeds that city in bigness: the streets are also broader and better paved, and the houses handsome, though it contains scarce eight thousand inhabitants. It is only walled round, and has a little castle of small force. Here are great numbers of French, English, Dutch, Genoese, and other merchants, who carry on a flourishing trade; and here also are made vast quantities of salt. In the year 1702 the English and Dutch made themselves masters of this place without opposition.

Cadiz, by the Romans called Gades, a celebrated trading city, stands on an island in the thirty-sixth degree thirty minutes latitude, and in the sixth degree forty minutes west longitude, on the north-west end of a long neck of land, that extends from the south-east to the north-west, and is also joined to the continent, from which it is divided by a narrow freight, by means of the bridge of Suaco, both ends of which are defended with redoubts, and some other raised works of earth. This island from Fort St. Catalina to the island of St. Pedro, is about eighteen miles long, and from the south point

near the island of St. Pedro to the northern one near the bridge of Suaco about seven in breadth. It produces little grain, but some of the best wine in Spain is made there. It has also some pastures, and on the side next the harbour is made large quantities of salt. It has also a considerable fishery, particularly of tunnies, which are here commonly between six and eight, and sometimes ten feet in length.

The city of Cadiz is of pretty large circumference, yet the whole neck of land which extends from the island is not built upon; the west side, which is very delightful, being almost uninhabited, the only buildings upon it are a spacious hospital and two chapels, it being less commodious for shipping than the east side. Most of the streets are narrow, crooked, ill paved, and dirty; but a few of them are broad, straight, and well paved. The houses are generally three or four stories high, and many of them are handsome buildings; but house-rent and provisions are dear, and good fresh water very scarce. It contains about thirteen convents, among which the college of the Jesuits is the finest in all Andalusia; but has only one parish church, which is the cathedral, tho' the settled inhabitants are computed at forty thousand. The bishop of this city is suffragan to the archbishop of Seville, and has an annual revenue of twelve thousand ducats. Here is established the West India company, which in 1717 was removed hither from Seville. Indeed at the earnest request of the last-mentioned city, it was restored to it again in 1725; but in 1726 was a second time brought back to Cadiz. Both before and after the arrival of the Spanish American fleet, this city is said to be crowded with strangers to the number of fifty thousand, who resort hither on account of trade, which causes an extraordinary circulation of money. Cadiz is the center of the whole American trade, to which the English, French, Dutch, and Italian merchants send their goods, which are shipped off here in Spanish bottoms to America, by Spanish factors in their own names. Besides these nations, all others who carry on any traffic here by sea, have also their agents, correspondents, and factors, in this city; and the consuls of those nations make a great figure.

Both the harbour and bay of Cadiz are spacious and secure, the entrance being defended by Fort Matagorda, which covers the harbour and bay of Cadiz, and by Fort Puntales, which stands opposite to it, on a point of that neck of land on which Cadiz is built. The Spaniards commonly call both these Los Puntales. The entrance into the harbour, between these points, is said to be five hundred fathoms wide. During the time of ebb a good part of the harbour, which is ten miles in circumference, is dry. Cadiz is fortified with walls and irregular bastions, and on the south side there is no approaching it, on account of the high and steep shore; on the north side the access is dangerous from the many sand-banks and rocks that lie under the water. The south-west side will indeed admit of landing; but is defended by Fort St. Catalina. On the south-south-west point is a ridge of rocks, part of which at full sea is covered with water; the outermost of these forms a small island, on which is a guard and light-house, with two chapels; and Fort St. Sebastian.

No people are happier than the merchants of Cadiz; for they seldom risk any thing upon their own account, and enrich themselves at the cost of those who send them goods; so that let things go as they will, they are no losers. But it must be said to their honour, that they are distinguished in a remarkable manner, by the strict honesty and integrity of their dealings; whence foreigners, with the utmost confidence, trust their effects and fortunes in their hands.

In 1596 this city was plundered and burnt by the English; but was again rebuilt by the Spaniards. In 1702 the English made another attempt upon it, but without success.

Algeziras is at present a poor old town in the Straights, and has a decayed harbour, with only a few shattered houses. The word Algezira, in Arabic, signifies an island, and the harbour being formed by two islands, it has been called in the plural number Algeziras. Here the

Moors first landed, and held the place almost seven hundred years.

Between the mountain and promontory, near Algeziras, and the mountain on which Gibraltar stands, is a bay. The last-mentioned mountain is a high and steep rock, joined to the continent by a low neck of land about four hundred yards broad, bounded to the west by the above bay, and to the east by the Mediterranean, where this rock is of an uncommon height, and almost perpendicular; yet towards the bay, or on the west side, the ascent is not so difficult. It divides itself into several parts, between which the sea flows, and its capes are defended by walls, bulwarks, and towers. This rock abounds with very wholesome herbs, among which is the ranunculus. The mountain formerly known by the name of Celpe, according to Busching, lies directly opposite to Cauta, in Africa, and is also called Sierra Ximiera and Sierra de las Mona, or the Apes Hill; but was formerly named Abyla. These two mountains are generally allowed to be the celebrated pillars of Hercules.

To the westward, at the foot of the first mountain towards the bay, lies Gibraltar, called by the Moors Gibel-Tarif, or Taric, that is Mount Tarif, or Taric, from the name of a Moorish general, who, at the beginning of the eighth century, bringing the auxiliaries of three Moorish princes to Spain, landed at the foot of this mountain, to which he gave his name, and the town afterwards built upon it was so called from him; Gibraltar being evidently an abbreviation of Gibel-Tarif, or Taric. It is not so considerable either for its extent or beauty, as for its strength and situation, which renders it one of the keys to Spain; and, what is still of more consequence, the key to the Mediterranean and Levant. It is accordingly provided with all the artillery, stores, and forces necessary for its defence. Exclusive of Europeans of most nations, here are Jews, Turks, and Moors, who are all permitted to enjoy a free trade. The harbour is formed by a mole, which is well fortified and planted with guns. It is accessible only on the land side by a narrow passage between the rocks and the sea, but that walled and fortified both by art and nature, being there so inclosed by high steep hills, as to be almost inaccessible that way. It has but two gates on that side, and as many towards the sea. Across this isthmus the Spaniards have drawn a fortified line, chiefly with a view to hinder the garrison of Gibraltar from having any intercourse with the country behind them. Those who have the courage to climb to the top of the rock will find it a plain, that affords a prospect of the sea on each side the strait, and of the kingdoms of Barbary, Fez, and Morocco; besides the cities of Seville and Granada, in Spain: for the strait is here only fifteen miles in breadth; and twenty-four in length. There is always a strong current running through it from the ocean into the Mediterranean. The garrison of Gibraltar is, however, confined within very narrow limits; and as the ground produces hardly any thing, all their provisions are brought them either from England or from Ceuta on the coast of Barbary.

This city was taken in 1704 in two days by a combined fleet of English and Dutch ships under the command of Sir George Rooke: but the same year the Spaniards attempted its recovery, at which time it stood out a memorable siege, in which between four and five hundred of the enemy having crept up the rock that covers the town, were the next morning driven down headlong: after which it was ceded to the English by the treaty of Utrecht, in 1713. The Spaniards again made an attempt, in the year 1727, with a powerful army; but were at last obliged to raise the siege, after lying before it several months, and even endeavouring to blow up the rock, which they found to be impracticable; it therefore still belongs to the crown of Great Britain. Since the above siege this fortress has been more strongly fortified, new works and improvements being daily added: it is rendered impregnable by any other means than treachery or surprize, for it cannot be starved while our fleet can bring supplies.

We

We now come to Cordova, the next kingdom included in the province of Andalusia, which, though much smaller than that of Seville, is equal to it in fertility.

The city of Cordova, antiently called Corduba and Colonia Patricia, is large, beautiful, and finely situated in a wide plain, on the banks of the Guadalquivir, at the foot of a ridge of mountains that are a branch of the Sierra Morena, in thirty-seven degrees fifty minutes north latitude, and in four degrees fifty-three minutes west longitude. Within its circuit it contains several gardens and vineyards; but its streets are narrow, and it is not very populous in proportion to its extent. Its fine suburbs have the appearance of so many towns. The bishop, who is suffragan to the archbishop of Toledo, has an annual revenue of forty thousand ducats. The cathedral is a large antique and magnificent square building, its roof being supported by three hundred and sixty-five stately pillars of alabaster, jasper, and black marble; and was built by the Moors for a mosque. It has nineteen naves running from north to south, separated by small beautiful pillars, some with fine Corinthian capitals taken out of the old temple of Janus Augustus, as appears by an inscription on a pillar of green marble, which in Mariana's time stood in the Franciscan convent in this city. These pillars would have a beautiful effect, were not the view of them interrupted with cross walls, altars, the choir, and the presbytery, which is built in the middle. The episcopal palace is a large structure. The inquisition stands by the river side, and the king's palace, which is at the west end of the city, is very spacious. In 1586 Cordova suffered very much by an earthquake.

The adjacent mountains are covered with delightful gardens and plantations of olives, oranges, lemons, and figs. They are also interspersed with pleasant valleys, refreshed by springs of good water. When the above-mentioned trees are in blossom, they diffuse a fragrant all over the country. Besides the excellence of the wine, and the plenty of fruits and vegetables, this country breeds the finest Spanish horses.

Andujar, or Anduxar, an antient and pretty large city, thirty-two miles to the east of Cordova, is situated on the river Guadalquivir, over which it has a stately bridge, and is defended by a strong castle. It contains three thousand families, has five parishes, six monasteries, three nunneries, and two hospitals; besides other stately and handsome buildings. It vends great quantities of silk. The neighbouring country abounds in corn, wine, oil, honey, and all sorts of fruit; and likewise yields excellent game.

The kingdom of Jean is the smallest of the three comprehended in the province of Andalusia.

The principal city it contains is Jaen, which stands at the foot of a mountain, and is defended by a castle. It is populous, and has some fine churches and monasteries; but the greatest devotion is paid here to St. Veronica. Its bishop, who is under the archbishop of Toledo, has a yearly income of twenty thousand ducats. It was once the capital of a Moorish kingdom; and the country, besides producing great plenty of corn, wine, oil, and fruit, particularly abounds in silk.

SECT. XVIII.

Of the Balearic Islands, Majorca, Minorca, Ivica, and Formentera. Their History, Situation, Extent, Produce, Inhabitants, and principal Towns.

THE four islands of Majorca, Minorca, Ivica, and Formentera, formerly composed the kingdom of Majorca. These islands are situated to the west of Spain; yet it is not known by whom they were originally inhabited: but Strabo mentions a colony of Greeks, who settled there from the isle of Rhodes. Afterwards the Carthaginians became masters of them, but were subdued by the Romans. In the fifth century the Vandals possessed themselves of these several islands, and towards the end of the eighth and beginning of the ninth century these were dislodged by the Moors, who, after a much shorter possession were expelled by the emperor Charle-

magne; but the Moors soon recovered them again, and had their particular king over them. Numerous wars were carried on between them and the Catalonians with various success, till towards the conclusion of the year 1229, James I. king of Arragon, dispossessed them of all the island of Majorca: in 1232 he also reduced Minorca, and in 1234 Ivica; and thus the whole kingdom of Majorca became annexed to the crown of Arragon.

These four islands, with the smaller ones lying near them, were by the antients divided into the Balearic and Pithyusæ. The former are Majorca and Minorca, which, with some smaller islands, were termed by the Latins Baleares, and by the Greeks Balearides, which signify the islands of Slingers, the inhabitants excelling in the dexterous use of the sling, as the Minorcans do to this day.

Mallorca, or, as it is pronounced by foreigners, Majorca, is situated about eighty miles south of the Spanish coast, and is the largest of these islands, it being about sixty miles in length, and forty-five in breadth. It has four chief capes which lie to the four cardinal points; these are Pedra on the east, Palermo on the west, Salinas on the south, and Formentella, or St. Vincent, on the north. This island is divided into two parts, that towards the north and west is mountainous, but not barren; and the other, which lies to the south and east, is level and laid out in corn-fields, vineyards, orchards, and pastures. The air is temperate and wholesome; but the excessive heat and drought frequently occasions a scarcity, though the island in general is well supplied with water, and naturally abounds in corn, wine, oil, honey, saffron, large and small cattle, wool, cheese, rabbits, partridges, deer, wild fowl, fish, and horses, without any ravenous wild beasts. The whole island is encompassed with strong towers, from which an enemy may be observed at a distance, and it has several good harbours and anchoring-places.

The inhabitants in their manners and customs resemble the Spaniards, and particularly the Catalonians. People of fashion speak the Spanish tongue, but the language of the commonalty is a medley of Spanish, Latin, and Limosin, which is a corrupt kind of French, Greek, and Arabic. The island maintains twenty companies of foot, five troops of horse, and two companies of matrosses, for the defence of the capital; besides four regiments stationed in other parts of the island.

Majorca, the antient Palma, is the capital, and is seated on a bay between two capes, in thirty-nine degrees forty minutes latitude, and in two degrees thirty-six minutes east longitude, on the west side of the island. It is fortified in the modern taste; is large, and has broad streets, spacious squares, stately stone houses, and twenty-two churches, besides chapels and oratories. The largest square is that of Born, which is encompassed on every side with grand buildings, from whence the principal inhabitants view the bull-fights and other shows. The cathedral is a large and magnificent structure, and the bishop is suffragan to the archbishop of Valencia. In the city are six hospitals, and three other foundations for women. It has a royal audience, in which the governor presides, an university, and a court of inquisition. The inhabitants are computed at about ten thousand. This city was taken by the English in 1706, and retaken in 1715.

There are several small towns in the island besides the capital, and round it are a considerable number of small islands, the principal of which are,

Cabrera, which is so called from the multitude of goats found there. It is all over mountainous, and uninhabited, except its spacious and secure harbour, the entrance into which fronts Majorca, and is defended by a castle, in which is always kept a small garrison. This island is a place for exiles.

Las Bledes is of some consideration; it was formerly very populous, and is still distinguished by having a good quarry of marble.

Dragonera is about a thousand paces in length, nine hundred broad, and twelve hundred from Majorca. It is uninhabited, and only produces an edible bird of prey called a Spaniard. It has, however, a fortress on a hill called Mount Popia.

We now come to Minorca, a considerable island fifty miles to the north-east of the island of Majorca. It is about thirty miles in length, twelve in breadth, and is chiefly valued for its excellent harbour of Port Mahon. The south shore of the island is smooth, but towards the north very rugged; and may in general be considered as a mountainous country, with some fruitful valleys. The sea has so withdrawn from this island, that near the harbour are several new flats, which are turned into garden-grounds. The air is moist; the heat in Fahrenheit's thermometer placed in the sun rises only to a hundred and two degrees, and is consequently not very intense: nor is the quicksilver known to sink very often under forty-one, which is short of the freezing point. The soil cannot be extolled for its fertility; besides, the water being hard, nephritic disorders are common here. The hedgehog is in this island esteemed a venomous animal, it being supposed to corrupt the water, particularly in rutting-time in the spring. One of the most profitable commodities of the country is salt, which the sun prepares in cavities between the rocks. Some of the wine is excellent, and the inhabitants are said to sell to the English as much of it as amounts annually to twenty-seven thousand pounds sterling. Here is great plenty of fish, particularly of wilks, which are of great service to the commonalty in Lent. Rabbits are to be met with here in great plenty; here are also wool, honey, wax, and capers, which grow upon the walls; but these, as well as olives and cotton, are also cultivated in plantations. The palm-trees here bear no fruit. The opuntia is very common, and plentifully eaten, as are also the acorns; and the myrtles, which abound here, are of great advantage to tanners. The inhabitants, however, are obliged to have their chief necessities, as corn, beef, brandy, tobacco, linen, stuffs, books, relics, Agnus Deis, from abroad; and all these together are said to stand them in no less every year than seventy-one thousand two hundred pounds sterling.

The natives live mostly on vegetables, love dancing, and have such a turn for poetry, that the very peasants challenge each other to trials of their poetic genius. They are very dexterous with their slings, and with them command their cattle; but as they are far from being industrious, they neglect many advantages they might

enjoy by husbandry and trade. The houses on the island are computed at about three thousand and eighty-nine, though the inhabitants are said to amount to twenty-seven thousand.

The English took this island from the Spaniards in 1708, after which it was confirmed to them by the treaty of Utrecht; but it was invaded by the French in 1756, when, after a very brave resistance under general Blakeney, the garrison was obliged to surrender, the French having invested Fort St. Philip with an army of fifteen thousand men, well provided with all military stores; but it was again restored to the English by the late treaty of peace. The principal places in the island are the following:

Port Mahon is defended by the castle of St. Philip, and works of great strength cut in the rock, on account of its being esteemed one of the most commodious harbours in Europe. Its entrance is indeed somewhat difficult, from the several rocks within it; but on the inside it is landlocked, and perfectly secure from tempests. Near it lies the little trading town of Mahon, from whence it takes its name.

Citadella, the capital of the whole island, and the seat of the governor, is fortified, and consists of about six hundred houses.

The island of Ivica, or Yvica, the antient Ebusus, lies fifty-six miles to the south-west of the island of Majorca, and is about five miles in length and four broad. The soil is not unfruitful; but is little cultivated, most of the inhabitants being taken up with the salt-trade, as being most profitable. It is very mountainous, yet, besides pines, produces fruit-trees of various kinds. Ivica, the capital, is fortified in the modern manner; but is much dwindled from what it was in the times of the Carthaginians and Romans. It is the residence of the governor, from whom there lies an appeal to the royal audience at Majorca.

Formentera, the antient Ophiusa and Collubaria, or the Adder Island, was formerly well inhabited, but at present is forsaken and desert, which is owing to the African corsairs, who are continually swarming about it. The island contains some harbours, and good anchoring-places; but all that is to be seen there is a kind of wild ass.

C H A P. XXVII.

Of the Kingdom of PORTUGAL.

S E C T. I.

Its Name, Situation, Extent, Climate, Soil, Produce, and Rivers.

THIS country was formerly called Lusitania; but its boundaries were then different from those it has at present. The name of Portugal is by some thought to arise from Portus Gallus, or Portus Gallorum, from the multitude of French which came to the city of Porto, on the river Douro, in order to assist the Christians against the Moors. But the more general opinion is, that it is derived from a town on the river Douro, by the antients called Cale; but by the moderns changed to Gaya: opposite to this place a new town, with a harbour, was built by the inhabitants, who gave it the name of Portucale, or the Port of Cale, which, by its uninterrupted prosperity, proved the origin of the present flourishing city of Porto; and the whole country from hence received the name of Portugal.

This kingdom, which is the most western in Europe, is bounded on the north by the Spanish province of Galicia; on the east by the provinces of Leon, Estremadura, and Andalusia; and on the south and west by the Atlan-

tic ocean; extending from the thirty-sixth degree fifty minutes to the forty-second degree three minutes north latitude, and between the seventh and tenth degree of west longitude from London. Its length from Valença, the most northern town in it, to Sagres, the most southern, near Cape St. Vincent, is about three hundred and ten miles; and its greatest breadth, from Peniche, a sea-port in Estremadura, to Salvaterra, on the frontiers of Spain, is a hundred and twelve.

The climate is much more temperate than in Spain, though it is a little different in the several provinces. The northern parts feel a kind of painful cold in winter, though this is chiefly owing to the rains which fall at that season, and in the southern the summer heats are very great. However, both winter and summer are very supportable; for cooling sea-breezes, during the latter, refresh the country, and the season of spring is extremely delightful.

The country is in many parts mountainous, and these mountains contain the ores of silver, copper, tin, and iron: but the Portuguese being supplied with metals from their possessions in other parts of the globe, and particularly with abundance of gold from America, no mines are worked in their own country. Gems of all kinds, as

turquois and hyacinths, are also found in the mountains; and particularly a beautiful variegated marble, with many other curious fossils of the lapidary kind, of which several sorts of work are made: here are also very good mill-stones, and on the hill of Alcantara, not far from Lisbon, is a remarkable mine of salt-petre.

Though the soil is very fruitful, agriculture is so much neglected, that above half the country lies waste, and the inhabitants are supplied with a great part of their corn by the English and Dutch, and have Indian corn from Africa. Portugal, however, abounds in excellent wine and oil; the greatest part of the latter is made in the province of Alentejo, for the olive-trees thrive better here, near the sea, than up in the country. Here are also abundance of oranges, lemons, figs, pomegranates, raisins, almonds, chesnuts, and other fruit. It produces great plenty of fine honey, and consequently of wax. The best honey found in the fields is almost of a white colour, and of a most agreeable flavour; and the wood-honey is more agreeable to the taste than in other countries.

As Portugal has some excellent pastures, particularly in the country about Montefrella and near Ourique, the grazing is in some places very considerable, and there are seen an uncommon number of horned cattle and sheep; but in most places it is at so low an ebb, that the greatest part of their oxen come from Spain. The horses are not large, but very fleet; and they have fine mules, which sell for a great price. The Portuguese breed more asses than horses, the latter being clandestinely imported from Spain.

From the mountains issue several streams and small rivers, which fertilize the valleys and fields, and either join the great rivers in their course, or discharge themselves separately into the sea: but all the great rivers of Portugal have their sources in Spain. The principal of these are the Minho, the Lima, or Lethe, the Douro, the Tajo, or Tagus, the largest river in the kingdom, and the Guadiana, with the Cayado; which last rises in the mountains of Trazos, and discharges itself into the sea below Barcelos.

All these rivers abound in fish; and the three principal, namely the Douro, the Tagus, and Guadiana, divide the kingdom into three parts.

S E C T. II.

The Manners, Customs, Persons, Dress, Houses, Furniture, Method of Travelling, Religion, &c.

EMANUEL de Farca, a Portuguese writer, describing his countrymen, says, "The nobility think themselves gods, and require a sort of adoration; the gentry aspire to equal them; and the common people disdain to be thought inferior to either." This pride is the characteristic both of the Spaniards and Portuguese; and here the grandees and their ladies carry their haughty spirit to such an extravagant height, that they stand upon the nicest punctilios with respect to rank and titles. The ladies of quality are served by their maids and slaves on the knee; and indeed the women of quality will scarce be spoken to by mean people in any other posture: a degree of haughtiness practised in no other Christian country, and which they probably received from the Moors. But this is far from being the worst part of their character; for it is become a proverb, that a Spaniard stripped of all his good qualities, makes a perfect Portuguese. Indeed they are generally characterized, as being cruel, treacherous, malicious, and revengeful, both to one another and to strangers; crafty in their dealings, and the meaner sort addicted to thieving. But to this general character there are many noble exceptions.

The Portuguese ladies are small of stature, with their complexion pretty much upon the olive; their features delicate; but their visage thin: their hair is black and shining, and their eyes sparkling; nor do they want a good share of wit. In short, they are for the most part generous, charitable, and modest. They wear hoops, and several gowns, one over another, of rich stuffs trimmed with gold and silver lace; but the uppermost is said to be of coarse black stuff, and so long that it trails upon

the ground. Their shoes are of black Spanish leather, straight as a glove, and without heels; whence within doors they seem to slide along rather than to walk. When they go abroad they have pattens, which are a kind of silk sandals fastened to rings or plates, that raise them half a foot from the ground, and make them walk very awkwardly; but in the house they neither wear hoops nor pattens. The stays, in which they have but little bone, are high before, but scarce reach half way up their backs behind, and consequently would expose the tawny complexion of their skins, if their shoulders were not covered with paint. Their hands and feet are small and well proportioned, and their wide sleeves, with broad ruffles, buttoned at the wrists, make their hands appear less than they are. The people of quality wear very fine linen, and as this is scarce and dear, the meaner sort have none; for rather than wear coarse linen, they will go without. The ladies wear about their necks a broad laced tucker, and instead of a girdle tie a string of medals or relics, or perhaps the cord of some religious order, about their waist, the ends of which reach down to the ground. Across the top of their stays they have a kind of breast-plate of diamonds, from whence there hangs a chain of pearls, or ten or twelve little knots of diamonds. They have likewise bracelets, rings, and pendants in abundance; but no necklaces. In their hair they wear a variety of precious stones, sometimes in the form of artificial butter-flies, or other insects; sometimes they adorn their hair with ribbons and feathers of various colours. When they go abroad they throw a veil over all, and women who are advanced in years wear a fine coil over their hair; but many of the young ladies have none.

The Portuguese gentlemen commonly wear black, and those of the court frequently follow the French fashions.

With respect to their houses and furniture, they have usually a great many rooms on a floor. The floors and ceilings are formed of a plain white plaster, that looks like polished marble. They change their furniture and apartments according to the season of the year; and upon the lower floors of their summer apartments they usually throw water every morning, which soon dries up, and leaves a refreshing coolness. Upon these floors they spread fine mats, and cover the walls with them chair-high; above these are hung pictures and looking-glasses, and all round the rooms of the ladies apartments cushions of silk or velvet are laid upon the mats, which they sit upon cross-legged, as hath been already observed with respect to the Spanish ladies. Between these cushions are fine tables and cabinets, and, at certain distances, vases of silver, in which are orange or jessamine trees, and in their windows they have frames of straw-work, to keep out the scorching beams of the sun.

In the upper apartments the hangings, cabinets, looking-glasses, paintings, and plate, are extremely rich, and the floors are frequently covered with Turkey carpets. In winter their beds and hangings are of velvet, trimmed with gold or silver lace; but in summer they use no curtains, except very thin ones, made of gauze, or some other slight stuff to keep out the gnats.

Vessels of copper, tin, or pewter, are said to be never seen in the houses of persons of quality, where they only use silver, or earthen-ware, and have many dozens of silver plates, and a great number of dishes of the same metal, with other utensils in proportion. But amidst all this wealth, the bad œconomy of the grandees is scarce credible, and reduces them to a necessitous condition, even while they make this glittering appearance. Most of them pass their lives in or near the capital, without ever visiting their estates, unless they happen to be disgraced at court: they leave every thing to their steward, and are above inspecting his accounts. Their tradesmen deliver their goods upon trust, and set down their own prices, being pretty well assured their bills will not undergo a strict examination. It is beneath a person of quality to endeavour to beat down the price of a piece of silk, or other goods, or even to take change of a shopkeeper out of a piece of gold; and as the tradesman frequently gives seven or eight years credit, he is obliged to set down double the price the goods might be bought for with ready money. They seldom, however, lose their debts, for the

the Spanish and Portuguese quality are men of such honour, that they readily assign a part of their rents for the payment of their debts, when pressed for money by their tradesmen.

The houses of the nobility are crowded with domestics; but their wages are very low, they having only eight-pence or ten-pence per day to purchase diet, cloaths, and every thing else; and a gentleman belonging to a grandee has only about fifteen crowns a month, though he is obliged to dress in velvet in winter, and silk in summer. Indeed the servants lay out the greatest part of their salaries in cloaths, living upon onions, pease, beans, and other pulse. One reason of the Portuguese nobility having such a number of servants is a custom which prevails among them of keeping all in their pay who have served their ancestors; so that some of the grandees have four or five hundred of both sexes, the greatest part of whom are merely for show, and seldom appear but on days of ceremony.

The quality, besides their ordinary servants, retain abundance of dwarfs of both sexes, who are dressed as fine as possible; they have also a pretty many slaves who are Moors, and are valued at four or five hundred crowns a piece. Over these they had formerly the power of life and death; but at present the government will not permit their killing them. Where two slaves marry, their children are slaves; but if a freeman marries a slave, the children are free. These slaves are their best servants, for the others will sometimes pride themselves on having as good blood as their masters. The very beggars rather demand than supplicate an alms, alledging their being descended from old Christians; and if you give them no money, must be dismissed with a compliment, upon which they go away contented.

The food of the Portuguese is nearly the same with that of the Spaniards, and they are equally sober and abstemious. The men mix water with their wine, and the women generally drink only water. It is customary with the Portuguese to betake themselves to sleep about noon, on account of the heat, and to transact most of their business in the morning and evening, or even at night.

The method of travelling here is much the same as in Spain, except their having fewer coaches, and travelling more by water than the Spaniards, from their country lying along the sea-coast, and its being crossed by many great rivers that rise in Spain. The mule or the litter are generally used on a journey; their horses, which are sprightly and well made, serve indeed for short visits, to prance at a procession, or before the windows of their mistresses; but the mules being stronger and surer-footed, are fittest to climb their mountains; but have only a slow pace.

Their language is a compound of the Spanish, Latin, Moorish, and French.

With respect to the religion of the Portuguese, they are the most bigotted Papists; but though the exercise of the Jewish religion be prohibited by the fundamental laws of the kingdom, yet all authors agree, that great numbers of secret Jews still remain among the Portuguese, and these too among the nobility, bishops, prebends, monks, nuns, and the very inquisitors themselves; and when unable to conceal themselves, escape to England or Holland, and there openly profess Judaism. The inquisition, which was introduced by king John III. and has since been set up in all the Portuguese dominions, except Brazil, is very active in detecting them, and those they call heretics, and no less rigorous in punishing them. Impious, cruel, and inhuman as this tribunal is, yet its festivals or solemn burnings, called *auto da fe*, or the act of faith, afford the highest delight to the infernal bigots, who, while their fellow-creatures, the supposed heretics, are burning in the flames, cry aloud, "Oh, what great goodness! Praised be the holy office." King John IV. in some measure, however, curtailed the power of the inquisition, commanding that all its sentences should be laid before the parliament, and that the accused should be allowed council for making their defence; and enacted, that only blasphemy, sodomy, heresy, sorcery, pagan customs, and the conversion of the Jews, should come under their cognizance.

The being an antient Christian, or in other words of an antient Christian race, is esteemed in Portugal a very high degree of pre-eminence, and far superior to what they call a new converted Christian, or a half new converted Christian; by which last they mean those whose new converted ancestors have married the antient Christians.

The number of convents in Portugal is said to amount to nine hundred, and most of them are very rich; but the Jesuits, who in multitude and opulence surpassed all the other orders, have lately been banished.

With respect to the ecclesiastics, there is a patriarch of Lisbon, who must always be a cardinal, and of the royal family. Next to him are three archbishops, who rank with marquesses, and the first of them the archbishop of Braga, who is primate of the kingdom, and lord spiritual and temporal of his city and the neighbouring country. The bishops hold the rank of counts. Besides those in Europe, the Portuguese have archbishoprics and bishoprics in the other three parts of the world.

The king of Portugal, besides the nomination of all bishops, receives a fourth of their revenue. The pope confirms the bishops, publishes his bulls in the kingdom without the king's previous consent, and, by his legate, governs the clergy, who with respect to taxes and contributions depend on him. He has also the gift of many small prebends. The pope's nuncios have here so lucrative a post, that they never fail of raising vast fortunes before they return to Rome.

S E C T. III.

The State of Learning and Arts; with the Commerce, Measures, Weights, and Coin of Portugal.

WITH respect to the state of learning in Portugal, it is at as low an ebb as possible. Indeed there are universities at Coimbra and Evora. At Lisbon is a royal academy for the Portuguese history; at Santarene is an academy of history, antiquities, and languages; and at St. Thomas an academy of sciences, on the same footing as that of Paris: but while bigotry continues here at its present enormous height, it is impossible for science to flourish. An Italian Capuchin, in 1746, published a work in the Portuguese tongue on the true method of study, in four volumes quarto, which he dedicated to the king of Portugal, and there asserts, that the schools of this country are places of retreat for those errors which by Newton and Des Cartes were driven out of the other parts of Europe; and according to him Galilæo, Des Cartes, Newton, and Gassendi are considered in Portugal as atheists and heretics, not to be mentioned but with some marks of execration. D'Oliveira, a Portuguese, says, in the preface to the first volume of *Memoirs*, "In our country we live in ignorance, without knowing it; but on leaving Portugal our eyes seem suddenly to open, and we immediately see that ignorance in which we were involved. Foreigners allow us understanding, docility, morals, discernment, and a genius for comprehending what is commendable and good; but our conceit, our gravity, our confined manner of life, which deprive us of all freedom of thought, expose us to just censures, and give rise to those hateful opinions other nations entertain of us. The main source of our ignorance, and the miserable cause of offence to all nations, is the custom in Portugal of publishing such a multitude of books, &c."

The Portuguese not only neglect agriculture, but all arts and manufactures, though the country has the finest materials; the greatest part of these are disposed of unwrought to foreigners, and when worked up are purchased again at a high price. The Portuguese indeed make a little linen, a variety of straw-work, and candy several kinds of fruit, particularly oranges. They have likewise some coarse silk and woollen manufactures; but these are trifling articles that support only a very small part of the nation.

The Portuguese, however, carry on a very extensive trade; but from this they reap little profit, being obliged to

to vend not only their own produce, but all the merchandize and riches brought from their settlements in other parts of the globe; and especially from America to the Europeans, particularly the English, in exchange for corn and manufactured goods of all kinds, with which they supply both Portugal and its possessions abroad. The chief commodities of the Portuguese consist of imports from their own colonies, particularly from Brazil, as tobacco, cacao-nuts, sugars, spices, drugs, ivory, ebony, brazil-wood, hides, gold, pearls, diamonds, and other valuable gems. In 1755 a new trading company to Grosplan and Maragnan was established here, and foreign merchants admitted to shares.

The Portuguese ships seldom frequent the other countries of Europe or the Levant, their voyages rather lying to the coasts of Africa, particularly the Gold Coast, whence they carry negroes to Brazil, and also purchase some gold and ivory. They likewise trade to their East India colonies of Goa, Diu, and Macao; but this traffic, though once very important, is now greatly declined. Brazil, however, is still a plentiful treasury to Portugal, and foreigners are entirely excluded from all commerce with that country. However, the Portuguese carry on a considerable clandestine traffic with the Spaniards, which chiefly consists in the exchange of gold and silver. From Brazil the Portuguese bring not only sugar and tobacco, but a great quantity of gold and diamonds. The fleet which annually sails to Brazil goes and returns in seven or eight months, and when homeward bound is convoyed by some men of war which are sent to meet it. Their ships from Africa or the East Indies also return home in company.

The long measure used by the Portuguese consists of *barros* and *cavidos*; a hundred *barros* make one hundred and sixty-four *cavidos*, or one hundred ninety-five and a half *Hamburgh* ells; but an hundred *cavidos* are only equal to sixty-one *barros*, or about one hundred and nineteen *Hamburgh* ells.

Of the Portuguese weights, we shall only mention the *arrobas* and *quintals*. In Portugal, an *arroba* is thirty-two pounds, and a *quintal* is four *arrobas*.

All sums of money are reckoned in Portugal by *reis* and *crusadoes*, which are not real, but only imaginary coins. The gold coins of Portugal are the double *moe-das* of one pound seven shillings value, the quarter of which is called a *millrei*, or a thousand *reis*, and has therefore the number one thousand marked upon it; and the *Johns*, worth three pound twelve shillings, which are subdivided into halves, quarters, eights, and sixteenths. The silver coins are the *vintain* of twenty *reis*; the half *teston* of fifty; and the whole *teston* of one hundred.

SECT. IV.

Of the Number of the Cities, Towns, and Inhabitants; with a concise history of Portugal, the present Nobility, the Titles of the King, the Orders of Knighthood, the Government, public Offices, Courts of Justice, Revenue and Forces.

WITHIN the kingdom of Portugal are nineteen cities, and five hundred and twenty-seven villages, or smaller towns. The number of the inhabitants may be pretty nearly computed, as lists of all the parishes in the towns and villages throughout the whole kingdom, and of the souls in every parish, have been made; and according to one of these lists in the year 1732, there is in the whole kingdom, three thousand three hundred and forty-four parishes, and one million seven hundred and forty-two thousand two hundred and thirty souls. But this list is said not to include the ecclesiastics, monks, and nuns, who amount to about three hundred thousand; so that in all Portugal, there were above two millions of people. The foreign merchants and colonies greatly diminish the number of inhabitants, and the multitude of convents must hinder their increase.

Portugal passed from the Phœnicians and Carthaginians into the hands of the Romans, and by the emperor Augustus was made a Roman province. Towards the beginning of the fifth century the Alans, and afterwards

the Swabians and the Visigoths, successively made themselves masters of this country. In the eighth century it was over-run by the Moors and Saracens, but gradually wrested from them by the Christians. Henry duke of Burgundy distinguishing himself by his eminent services against the Moors, Alphonso VI. king of Castile, gave him his daughter Theresa in marriage; created him earl of Portugal, and in 1110, left him that kingdom. Alphonso Henriques, his son and successor, obtaining a signal victory in 1139 over the Moors, was created king by the people; and in 1181, at an assembly of the state, the succession of the crown was settled. Alphonso III. added Algarve to the crown of Portugal. In 1383, the legitimate male line of this family becoming extinct in the person of Ferdinand. John I. his natural son was two years after admitted to the crown, and in his reign the Portuguese made settlements in Africa, and discovered the Islands of Azores. In 1482, his great grandson John II. received the Jews who had been expelled from Spain, and gave great encouragement to navigation and discoveries. Afterwards, in the reign of king Emanuel, Vasco de Gama discovered the way to the East Indies, by doubling the Cape of Good Hope. In 1500, Brazil was discovered by Don Pedro Alvarez, and the Spaniards made numerous discoveries in the East Indies, where they soon erected forts, subdued the neighbouring inhabitants, and carried on a bloody war in Africa. The power of Portugal was then at its height; but in 1580, on the decease of Henry the Cardinal, the male line of the royal family became extinct, and the succeeding year the kingdom became united to Spain. The Portuguese now lost most of the advantages they had obtained under their own monarchs; their possessions in the East Indies, in Brazil, and the coast of Africa, were neglected, and many of them wrested from them by the Dutch, who were at war with Spain, and by the other maritime powers, while at home the Portuguese were much oppressed; but in 1640, they shook off the Spanish yoke, by electing John duke of Braganza for their king. This prince, who assumed the title of John IV. drove the Dutch out of Brazil, and from him all the succeeding kings of Portugal have been descended. Alphonso VI. was dethroned by his brother Peter, who in 1668, concluded a treaty with Spain, by which Portugal was declared an independent kingdom. Don Joseph, the present king, ascended the throne in 1750; but his reign has been filled with a variety of calamities, which have deeply affected the kingdom in general, and particularly Lisbon: an earthquake, a fire, famine, an assassination plot against the sovereign, executions upon executions, the scaffolds and wheels for torture reeking with the noblest blood; imprisonment after imprisonment of the greatest and most distinguished personages, which produced the expulsion of the Jesuits, who are said to have been concerned in the horrid scheme of murdering their king. The invasion of the kingdom by a stronger and more powerful nation; the numerous troops of the enemy laying waste the country with fire and sword, and rolling like distant thunder towards the capital. "The Spanish ministry, says Mr. Clarke, had already decreed the doom of Portugal, and nothing was to be heard at the Escorial, but Carthage is fallen. Carthaginian, perhaps, or Jewish story, may possibly afford a scene something like this, but for the shortness of the period, not so big with events, tho' in their final destruction superior. From that, indeed, under the hand of Providence, the national humanity and generosity of Great Britain has preserved the Portuguese: and it remains now to be seen, in future treaties, how that people will express their gratitude."

The nobility are extremely numerous; many of them are of the royal blood, and descended from the natural sons of the royal family. The nobility are divided into the high and low: the higher, styled titled nobility, consist of dukes, marquises, counts, viscounts, and barons. Those who are *grandees*, and styled *dons*, are, like those of Spain, divided into three classes, and receive from the royal treasury a pension sufficient to support their respective dignities. The sons of a duke are also *grandees*, and his daughters hold the rank of marchionesses. The inferior nobility, or gentry, are termed *fidalgos*, and are

are incapable of bearing the title of don, unless they obtain the king's permission.

The king's titles run thus, Joseph by the grace of God, king of Portugal, and of the Algarves on this and the other side of the sea of Africa; lord of Guinea, of the conquest, trade, and navigation in Æthiopia, Arabia, Persia, India, &c. and in 1749, Pope Benedict XIV. conferred on him the title of Most Faithful Majesty.

The arms of Portugal are a shield argent, with five small shields azure, placed crosswise, on each of which are five silver pieces in the form of a St. Andrew's cross. On the border of the shield are the arms of Algarve, which consists of seven ancient castles.

The principal order of knighthood is that of Christ, instituted by king Dennis, soon after the abolition of the knights Templars. They have four hundred and fifty commanderies, and wear for a badge of the order, a red cross within a white one.

The order of St. James, has forty-seven small towns, with one hundred and fifty commanderies, besides the splendid convent of Santos o Novo, a little to the west of Lisbon. The badge of this order is a red sword, in the shape of a cross, the hilts resembling those of ancient swords.

The order of Aviez has forty-nine commanderies, and the badge belonging to it, is a green cross in the form of a lily. These three orders are all religious; but the knights have leave to marry, and the kings of Portugal are perpetual grand masters. The knights of Malta have also twenty-three commanderies here.

With respect to the government of Portugal, the king is in many respects an unlimited monarch; but on the imposition of new taxes, the settlement of the succession, and other important concerns, the consent of the cortes, or states, which consist of the clergy, the high nobility, and the commons, is necessary. The clergy are here represented by the archbishops and bishops, the high nobility are, as hath been already said, the dukes, marquises, counts, viscounts and barons, and the representatives of the commons are chosen by the cities and towns. Among them are also reckoned the lower nobility, and the masterpieces of the order of knighthood. This assembly never meets but by the king's proclamation, and though the crown is hereditary, yet the consent of the several states is necessary to the succession of a brother's children. The crown too devolves to the female line; but this right is forfeited, if they marry out of the kingdom.

The highest office is the council of state, in which all the great affairs of the kingdom are transacted, with the disposal of all ecclesiastical and temporal offices, as the nomination of all archbishops and bishops, viceroys, captain-generals, governors of the provinces, with every thing relating to peace and war, embassies, alliances, &c. In the year 1732, this council consisted of five ecclesiastics, and an equal number of officers, with the secretary of state.

The council of war regulates all military affairs, and every thing relating to them.

The council of the palace is the highest tribunal, to which causes may be brought from inferior courts by appeal; it nominates to all offices belonging to the law, besides disputes of jurisdiction, between the lay and spiritual courts; examines the briefs of the Pope's nuncios; and, besides a variety of other business; draws up all laws, orders, edicts, privileges, and grants. This court consists of a president and several counsellors, whose number is not limited; five secretaries, each of whom has his particular department. And under this tribunal is the chancery, which consists of a chancellor, a treasurer, and other officers.

The *Casa da Supplicação*, is the first and highest tribunal of justice, and without appeal in civil and criminal cases. To its ordinary jurisdiction belong the provinces of Estremadura, Alentejo, and Algarve; and to it lie final appeals from the following court.

The second high court of appeal, has its seat at Porto, and to its ordinary jurisdiction belong the provinces of Entre Duro e Minho, Trazos Montes and Beira. All processes not exceeding twenty-five thousand reis in moveables, and three hundred thousand in immoveables

are finally determined in this court, which consists of twenty-three officers.

The treasury court is divided into three offices, one of which superintends the finances of the kingdom; the other those of Africa; and the third, those of the Indies, the magazines, and armaments.

For the inferior administration of justice, each of the six provinces of the kingdom have inferior courts.

The king's revenue arises first, from the hereditary estates of the royal house of Braganza, to which belong fifty villas. Secondly, from the royal domains. Thirdly, from the customs, of which those of Lisbon are most considerable. Fourthly, from the taxes. Fifthly, from the excise, which is very high, and paid even by the clergy. Sixthly, from the monopoly of Brazil snuff, which, in 1755, was farmed for three millions of crusadoes. Seventhly, from the coinage. Eighthly, from the sale of indulgencies, which the Pope renews to the king every three years by a special bull. Ninthly, from the grand masterpieces of the order of knighthood, which the king holds in his own hands. Tenthly, from the ecclesiastical tithes in foreign countries. Eleventhly, from the duty of the fifth part of all gold brought from Brazil, which annually amounts to three hundred thousand pounds sterling; and lastly, from the farm of the Brazil diamonds.

The military forces in time of peace, when complete, amount, according to Dr. Busching, to no more than fourteen thousand men, and the same author observes, that the Portuguese navy in 1754, consisted only of twelve ships of war, and these but weakly manned.

The Portuguese foreign dominions, which were formerly extremely considerable, are now greatly diminished.—They at present possess in the Atlantic ocean, the Cape de Verd islands, St. Thome, &c. In Africa, fort Magazan on the coast of Morocco, Cacheo on the Negro coast; several forts in the kingdom of Congo, Loango, Angola, and Monomotapa; a fort in Monomotapa; the town of Mosambique in the kingdom of that name, and the town of Sofala. In Asia, the towns of Diu, Goa, Onor, Macao, &c. In America, Brazil, part of Guiana, and Paraguay.

The provinces of Portugal beginning at the south east, are the following, Estremadura, Beira, Algarve, Alentejo, Estremadura, Beira, Trazos Montes, and Entre Duro e Minho. We shall begin with the former, and treat of them in this order.

S E C T. V.

Of the Province of Algarve, or Algarva: Its Situation, Extent, Produce, and principal Towns.

THE kingdom of Algarve, or Algarva, is the most southern province of Portugal, and is bounded on the north by the province of Alentejo, from which it is separated by the mountains called Caldeirao and Monachique. On the east it borders on the Spanish province of Andalusia; and on the south and west on the sea. Its length from north to south is computed at about eighty-four miles, and from east to west at about twenty-four.

As palm-trees abound in Algarve, the poor people employ themselves in working up the leaves into a variety of forms. But this province, notwithstanding its maritime situation, commodious harbours, and inland fertility, seems to have been treated by the kings of Portugal rather as a conquered country, than a province of the kingdom.

Algarve anciently comprehended a much larger tract than it does at present; for it extended, not only beyond the whole coast of Cape St. Vincent, as far as the town of Almeria, in the kingdom of Granada, but along the opposite coast of Africa; hence the kings of Portugal stile themselves kings of Algarve, both on this and the other side of the sea, in Africa; they having formerly made themselves masters of Tangiers, Ceuta, and several other parts of the African coast in the Mediterranean.

The face of the country is generally mountainous ; but affords plenty of wine, figs, raisins, oil, and almonds, which are however inferior to those of Spain ; and it likewise abounds in dates ; but they have not always corn sufficient for their own use.

It contains four cities, twelve towns, and sixty villages, some of which are very populous ; with sixty-seven parishes, and sixty thousand six hundred and eighty-eight inhabitants. This province is divided into three jurisdictions, the principal places in which are

Lagos, a city in a fine bay, navigable for the largest ships, it is seated in latitude thirty-six degrees fifty-one minutes, and in nine degrees thirty-six minutes west longitude, about five leagues to the eastward of Cape St. Vincent. Its situation will not admit of a regular fortification ; but the city is walled, and the harbour well secured by two forts. The inhabitants amount to about two thousand six hundred ; it contains two parishes, and four convents, some chapels, an house of mercy, and is the residence of the governor and captain-general of Algarve, of a corregidor, and other officers. Here the English fleets, bound to the Streights, usually take in fresh water.

Tavira is a city pleasantly seated on a bay, which has a harbour defended by two forts, and lies twenty-five miles to the east of Faro. The little river Sequa, which runs into the bay, divides it into the east and west-town. Besides its walls, and the above ports, the town is defended by a castle, and contains above four thousand seven hundred inhabitants, two parish churches, one house of mercy, one hospital, and five convents.

Faro is a considerable port, strongly situated on the ocean, in a level country, in the thirty-sixth degree forty-eight minutes north latitude, and in the ninth degree twelve minutes west longitude, twenty-four miles to the east of Lagos, and is defended by a good modern fortification, with a castle and other works. It contains four thousand five hundred inhabitants, and is the see of a bishop ; but has only a cathedral, one church, a house of mercy, an hospital, and four convents. The town is subject to the queens of Portugal. The sea in its neighbourhood produces abundance of good fish, and most of the inhabitants are employed in the fishery.

S E C T. VI.

Of the Province of Alentejo ; its Situation, Extent, Produce, and principal Cities.

THE province of Alentejo, which is one of the largest in the kingdom, is bounded on the north by Estremadura and Beira, on the east by Andalusia and Spanish Estremadura, on the south by Algarve, and on the west by the Atlantic ocean ; extending from north to south about a hundred and twenty-seven miles, and nearly as much in breadth. It is called Alentejo, from its being situated beyond the Tejo, or Tagus.

Its principal rivers are the Tagus and Guadiana ; and though it contains some mountains, it is for the most part level and very proper for tillage. Its principal products are wheat and barley ; it also produces excellent wine and admirable fruit ; the best sweet or China oranges come from hence, and they have abundance of game and fish. Their mutton and beef are good, and they make better cheese than in any other province. Here are also several kinds of marble, and in some parts are found various gems. The fertility of this province has frequently rendered it the theatre of war ; and on this account the king of Portugal has here several good fortifications. The whole province contains four cities, eighty-eight towns, three hundred and fifty-six parishes, and about two hundred and sixty-eight thousand and eighty souls ; and is divided into eight districts, the principal places in which are the following :

Evora, a city sixty-eight miles to the south-east of Lisbon, is seated on a hill, which is at some distance almost surrounded with mountains : on the north and east stands Mount Ossa ; to the south, the mountains of Portal and Viana ; and to the west, Montemaro. The inhabi-

tants amount to about twelve thousand : it has five parish-churches, including the cathedral, one house of mercy, one royal and several other hospitals, and within its circuit and neighbourhood are twenty-one convents and colleges. It has been lately fortified with twelve whole and demi-bastions, and on the north side is defended by a quadrangular fort, with four bastions, and a like number of ravelins. It was antiently only a bishop's see, but in 1540 was raised to an archbishopric, under which are the bishops of Elvas and Faro. It is the capital of the province, and has an university.

Estremos is a city which stands six or seven leagues to the north-west of Evora, on a hill which it entirely covers, and is divided into the Higher and Lower Town. The houses of people of condition make a handsome appearance, being built with white marble, which they find near the city. It contains three parish-churches, one house of mercy, one hospital, and six convents, with above six thousand five hundred inhabitants. Without the town is so large a spring, that it turns several mills near its source. It was strongly fortified when Portugal shook off the Spanish yoke, it being not far from the frontiers of Andalusia. They make here a very fine red earthen-ware, great quantities of which were formerly exported to England and other parts of Europe.

Villa Viciosa, or the Delightful Town, stands in a most fertile pleasant country between Elvas and Estremos, and is also defended by a castle which commands the place. It is particularly remarkable for having a large and beautiful palace, with an adjoining park three leagues in circumference. The city contains only two parishes, six monasteries, three nunneries, a house of mercy, and an hospital, with about three thousand seven hundred inhabitants. In the suburbs is an old temple formerly dedicated to Proserpine, and now to St. James. Many inscriptions have been found here in honour of that pagan deity.

The city of Elvas stands about twenty-four miles to the eastward of Estremos, and six from the frontiers of Spanish Estremadura ; it is seated on a hill, defended by a castle, and strongly fortified ; the works being of hewn-stone. It contains three parish-churches, besides the cathedral, one house of mercy, one hospital, and seven convents. The inhabitants of this place and its district, which consists of ten parishes, amount to about twelve thousand four hundred persons. One of its principal curiosities is a very large reservoir, or cistern, so spacious, that it is said to hold water enough for the inhabitants for six months. The water is conveyed into it through an aqueduct about four miles in length, supported in some places by three arches one over the other.

Olivenza is seated in a large plain on the east side of the river Guadiana, fifteen miles to the south of Elvas ; and as the Spanish Estremadura lies near it, it is fortified after the modern way, having nine bastions, eight ravelins, with a castle, and other works ; it has also two parish-churches, one house of mercy, a monastery, two nunneries, and an hospital ; and, including its district, in which are four parishes, contains about five thousand three hundred souls.

Campo Mayor is a modern fortification, in which are four whole and five demi-bastions, which lie about the distance of a musket-shot from the town. It is seated in a wide plain, ten miles to the north of Elvas ; and though it contains only one parish-church, two convents, one house of mercy, and an hospital, has no less than five thousand three hundred inhabitants.

Portalegre is a fine city, situated at the foot of a lofty mountain in an agreeable country, ninety miles to the eastward of Lisbon, and near the frontiers of Spain. It is fortified after the antique taste, with walls and towers, and contains about five thousand six hundred inhabitants. It has a cathedral, four parish-churches, five convents, a house of mercy, and an hospital. In the year 1550 it was erected into the see of a bishop, in whose diocese are forty-one parishes.

Beja stands on an eminence in the midst of a fertile plain, ninety miles to the south-east of Lisbon, and nine to the westward of the Guadiana. It was formerly called Pax Julia, and also Pax Augusta. It is of a round form,

form, and defended by an antique wall and towers. It was antiently a Roman colony, and three of the present gates are said to be of Roman architecture. This city contains six thousand two hundred inhabitants, and is divided into four parishes, seven convents, one house of mercy, and an hospital,

Serpa is situated on a rocky and uneven eminence, eighty-three miles to the south-east of Lisbon, and about a league to the eastward of the Guadiana; it contains two parishes, a monastery, and a house of mercy, with about four thousand inhabitants. The adjacent fields are extremely agreeable, being planted with groves of olive and fig-trees.

S E C T. VII.

Of the Province of Estremadura; its Situation, Extent, Produce, and principal Cities; with a particular Description of the City of Lisbon.

ESTREMADURA, or Extremadura, is bounded on the north by the river Mondego, which separates this province from Beira; on the east by the same province of Beira, and that of Alentejo; on the south by another part of Alentejo; and by the ocean on the west; extending about an hundred English miles in length, and forty-five from east to west.

It obtained its name from a custom observed by the kings of Leon, during the dominion of the Moors in Spain, of nominating their conquests, of which the present kingdom of Portugal was a part, by their situation with respect to the Douro, all the countries beyond that river being called *Estrema Durii*.

The soil is esteemed the most fruitful in Portugal, it producing collectively what is found only separately in the other provinces; particularly corn, wine, oil, millet, pulse, and fruit of all kinds. The country that lies between Lisbon and Abrantes is a most delightful plain, thick set with olives and other fruit-trees. This province also produces and exports great quantities of sea-salt. Through it runs the large river Tagus, which, after forming a spacious and secure harbour at Lisbon, loses itself in the sea.

Estremadura at present contains three cities, an hundred and eleven towns, and three hundred and fifteen parishes, which in 1732 were computed to contain two hundred and ninety-three thousand five hundred and ninety-eight souls, exclusive of the inhabitants of the parishes of the east part of Lisbon, which are not brought into the account; and the province is divided into eight jurisdictions, the principal places in which are the following:

Lisbon, the metropolis of the kingdom, is situated in the thirty-eighth degree forty minutes twenty-five seconds north latitude, and in the fifth degree thirty-seven minutes fifteen seconds west longitude. It extends from east to west along the north side of the river Tagus, and resembles an amphitheatre, containing within its circuit seven steep hills. The length of the whole city is near two miles; but its breadth is inconsiderable. The valleys of these hills form streets above a mile in length; but most of them are very narrow, ill paved, and dirty. Those streets that have a descent, and are washed clean by the rain, are much the sweetest; for the rest are so full of all manner of filth thrown out of the houses, that it is not easy to pass them. The houses of the citizens are generally old ill-contrived buildings, with lattice windows, which are no great ornament; but those of the nobility are very handsome structures, built with hewn-stone, and have both yards and gardens that take up a great deal of ground; but few of them have courts before them. This city contained, before the late earthquake, forty parish-churches, besides the cathedral, and about as many monasteries of both sexes. The finest square is that before the royal palace, which forms one side of it, another side runs along the river, and on the opposite side is a range of fine buildings. This square, before the period just mentioned, was extremely delightful; for here were the most elegant buildings in the city: here they celebrate their bull-fights; and here they more

barbarously burn those unhappy people who have the misfortune to be condemned by the inquisition. Near this is another square on the bank of the river, where the principal market is held; but the largest is that called the Rucio, where the several hills about it form a kind of amphitheatre, and it is adorned with several magnificent houses of the nobility.

The king's palace is the most remarkable building, and makes a very splendid appearance. The apartments are grand, very commodious, and richly furnished in winter; but in summer they take down the hangings and curtains, and there only remain the bare walls, which are, however, adorned with pictures. In it are two galleries about a hundred paces in length, in the first and second stories, with balconies in the windows. In the third story is the royal library, which contains a great number of valuable books in presses. Within the palace are also several large rooms where the cortes, or states, the council of war, and the courts of justice assemble. The king's chapel is an elegant building, richly adorned, and shining with gold and azure, the very silver alone being valued at about a million sterling. Adjoining to the palace is a square court surrounded with a piazza, where the merchants meet, and expose their goods to sale.

Since the erection of the royal chapel into a patriarchate, the city, with respect to its ecclesiastical jurisdiction, is divided into two dioceses: East Lisbon, which is subject to the archbishop, and contains sixteen parishes; and West Lisbon, under the patriarch, contains twenty-one parishes. The pomp assumed by the patriarch on festivals is said to surpass even that of the pope.

The churches of Lisbon are very fine, but the cathedral is a very heavy building, though it is handsome and richly ornamented within; as indeed are most of their churches, with a profusion of paintings, images, crosses, pixes, &c. costly vestments for the priests, and dresses for the saints; many of them enriched with diamonds, and other precious stones; with a vast quantity of silver candlesticks and other ornaments. The convents and colleges amount to thirty-two for the monks, and eighteen for nuns; some of these have most magnificent churches, particularly that of the Dominicans, in which are three chapels shining with gold from the pavement to the roof; this structure is very large, and on the day of an *Auto da fé* is the rendezvous of the procession; and in it the sentence of the unhappy sufferers is publicly read. In the church of the Augustines, called Our Lady of Grace, is a cross of gold adorned with precious stones, which is valued at a hundred thousand crowns, and carried in procession at their grand festivals. The most remarkable of the other convents are, that of St. Bento, belonging to the Benedictines; St. Domingo Graça, where the Augustine hermits reside, which, besides a delightful prospect, resembles a stately palace.

Among the many noble hospitals in this city is the celebrated house of mercy, which is under the direction of a society composed of persons of the highest rank in the kingdom, the king and princes of the blood being frequently members of it. They not only breed up sixty boys, and give portions to a hundred and fourteen maidens, but distribute an incredible number of other charities, as relieving prisoners for debt, maintaining decayed persons that cannot beg, and assisting families that are ashamed to let their wants be publicly known.

The great hospital is obliged to receive all persons of whatever nation or religion; nor is this charity confined to the sick, or to such as meet with casual misfortunes, as broken limbs, blindness, &c. but extends to ideots, lunatics, and foundlings.

The inhabitants of the city do not at most exceed a hundred and fifty thousand. The government of Lisbon is lodged in a council, which consists of a president, who is always a person of the first rank, six counsellors, and several other inferior officers.

The trade of this place, and the navigation to and from it, is so very considerable, that the custom-house, which lies on the Tagus, is the principal source of the king's European revenues; and this is the grand magazine of all the goods which the Portuguese fetch from their foreign colonies. The harbour is very large, deep, secure, and convenient; and has two entrances, that on

the north, called the Corredor, lies between the sand-bank, the rock of Cachopos, and Fort St. Julian: the southern entrance, which is much broader and very convenient, is between Cachopos and the fort of St. Laurence. The city is walled round, having seventy-seven towers on the walls, and thirty-six gates. It has so increased by degrees, particularly toward the west, that the old walls now divide the two dioceses. In the center of the city, on one of the hills, stands a citadel that commands the whole place, and has caverns in it, in which four regiments of foot are constantly quartered. Close by the sea, at the distance of about ten miles from the city, both the entrances to the harbour are defended by two forts; that on the north stands on a rock in the sea, and is called St. Julian; the other to the south is built on piles on a sand-bank, and is named St. Laurence, but is more commonly called Bogio. Two Portuguese miles from St. Julian, and one from Lisbon, stands the fort of Belem, which commands the entrance into the city, where the masters of all ships coming up the Tagus must bring to, and give an account of themselves; and directly opposite to it on the south side is the fort of St. Sebastian, commonly called the Old Fort, which stands on the angle of a mountain, along which a little way on the other side of the city the passage is defended from the beginning of the harbour by a chain of twelve forts.

If we take a view of Lisbon from the river, or from the opposite shore, it affords an admirable prospect; for the city being built in the form of a crescent, and the palace, churches, convents, and other buildings rising gradually from the river one above another, we command the whole city at once. On the other hand, the view of the Tagus, from those windows of the town which command it, is remarkably pleasing: the small boats which sail with any wind or tide, and are continually passing; the river crowded with ships of all nations; the coming in of a Bahia or Brazil fleet; the opening of the river towards the bar, with the castle of Belem on the right, the king's palace, and the castle of St. Julian's on the left; all together form a fine and agreeable view.

In order to convey as distinct an idea as possible of the present condition of this city, and what it has suffered by the late dreadful earthquake, which happened on the first of November, 1755, we shall give the observations of the Rev. Mr. Clarke, who was there in the latter end of the year 1761. "After landing, says he, "we passed through some streets, near a mile in length, "where the houses were all fallen on each side, and lay "in that undistinguished heap of ruin, into which they "sunk at the first convulsive shocks. Not that the reader is to imagine, that the greatest part of that fine "city fell on that fatal morning; so far from it, that, I "believe, not above one-fourth part of it was destroyed: for it prevailed more in one particular quarter than "the rest; and there the desolation was almost universal, "scarce an house or building that was not thrown down. "In the other parts of the city, some single ill-conditioned, or ruinous buildings fell, but the rest stood. "And there is scarce a street but you will see shores, and "props fixed to the buildings on each side, to prevent "their falling even now; they having suffered so much "from the shocks they had received. Considering how "much time has elapsed since the earthquake, little has "been rebuilt in proportion.—They have built a custom-house, an arsenal, a theatre, and some few other "buildings. All agree, that the fire occasioned infinitely more havock than the earthquake. Thousands of "the inhabitants, unhappily, in the first confusion of "their fear, taking the ill-judged step of thronging in "to the churches; the doors of which being sometimes "shut by the violence of the crowd, and sometimes "locked by mistake, when the fire seized the roofs of "those buildings, these unhappy sufferers were most of "them destroyed; some by sheets of lead, that poured "like a molten deluge upon their heads; others mangled by the fall of the roofs, and the rest burnt alive. "One's imagination can scarce form a scene of confusion, horror, and death, more dreadful than this. "After the shocks were over, the fire continued burning "for many weeks; and it is thought, was one principal

"cause of their escaping the plague, as the putrefaction "of the bodies was by that means much less.

"The calculation of the number that perished, as "they kept no registers, must be in great measure conjectural; but that thousands and ten thousands were "destroyed, there is no doubt. The morning on which "it happened was most remarkably serene and pleasant, "particularly about ten o'clock, and in one quarter "more, all was involved in this dreadful scene of terror "and destruction. As this event produced many changes, "those among the commercial parts of the city were "not the least remarkable. One, who yesterday was "at the eve of bankruptcy, found himself to day with "his books cleared; and hundreds, who lived in ease "and affluence, as soon as they had recovered from their "first panic and dismay, saw want and poverty stare "them in the face."

The same author observes, that some of their churches, the arsenal, the theatre, which is an elegant building, and above all the aqueduct of Lisbon, deserve the attention of every traveller; the center arch for its height being one of the noblest perhaps in Europe. One thing, he observes, is remarkable, that during the earthquake this building stood, though many of the key-stones fell several inches, and hang, only because a small part of the key-stone was caught by the centers closing again.

Belem, about a mile from Lisbon, is a small town, where stands a port already mentioned, and a monastery belonging to the monks of St. Jerom, founded by king Emanuel. Its large and magnificent church, which was dedicated to our lady of Judah, whence the palace obtained the name of Belem, or Bethlehem, was lined with jasper and the finest marbles from top to bottom, and here were interred several kings and queens of Portugal; but in the year 1756, this structure suddenly sunk into the earth.

Mafra, a small town, containing about one thousand and forty inhabitants, near which king John V. erected a building of extraordinary magnificence, in a sandy, barren spot. This was done in pursuance of a vow made in a dangerous fit of illness, when he promised to found a convent for the poorest friary in the kingdom. Upon enquiry, the poorest convent appeared to be at Mafra, where twelve Franciscans lived together in a hut. To accomplish this vow, the king procured from Rome the draught of a building that was greatly to exceed the Escorial. This he erected: in the center stands a temple built entirely of marble, and behind the choir is a house endowed with a large revenue for two hundred Capuchins, who officiate in this pompous church as chaplains. To the right of this building is a superb and spacious palace for the king, the royal family, and the chief officers of the court. On the left is another palace, equal in grandeur to the former, for the patriarch and twenty-four canons, who have the privilege of wearing mitres. Twelve thousand people were employed in raising these structures, and, by certain computation it cost three fourths of the royal treasure, and of the gold of the Brazil fleets. At the distance of a mile from the church stands an elegant house, with a small wood, which has a beautiful effect in this sandy waste. The palace at Mafra looks towards the sea, and serves for a landmark.

Torres Vedras is seated in a low place among the mountains, and in its neighbourhood are all kinds of fruit. It is one of the most ancient towns in the kingdom: to the north it is washed by the little river Sigandro; it contains about two thousand two hundred and fifty inhabitants, four churches, three convents, and a castle, with one house of mercy, and an hospital.

The mountain of Cintra consists of large rocks of flint, some of which are ten feet in diameter, and lie on one another without any connection. It is also very rich in ore, and produces a great number of remarkable plants, and also a vein of loadstone. Near the summit are the ruins of an old Moorish town and fortress, with a reservoir which contains very fine water, to the depth of ten feet. Among the wastes and rocks between the mountain of Cintra, and the top of Cabo da Roca, is a tract ten miles in length, which abounds in wolves and a species of wild goats. At the foot of the mountain

of Cintra, is a town of the same name, which contains about one thousand nine hundred inhabitants, with four churches, and is defended by an old castle built in the Moorish taste. The air here is thought to be the best in all Portugal, it enjoying a pleasing coolness, while the heat of Lisbon is extremely sultry.

Thomar, a town seated in a pleasant plain near the ruins of the old city of Nabancia, from which it is separated to the north by the river Nabao. The inhabitants are about three thousand six hundred, and besides its two churches, one of which is collegiate, it contains one house of mercy, one hospital, and four convents, among which is that of the religious order of Christ, situated on a hill to the west of the town. This is the principal place belonging to the order, and the superior of the convent bears the title of prior and general of the order of Christ. In 1752, the king founded an academy of sciences here on the same footing as that of Paris, and not only assigned a liberal income for its support, but declared himself president. This place formerly belonged to the knights templars, and on their suppression, the order of Christ succeeded to their possessions, and to the government of Thomar.

Santarem, a town on the Tagus, about twelve or thirteen miles to the north east of Lisbon, is seated on a delightful plain, environed with mountains beautifully intersected with valleys. In its form it resembles an half moon, and is defended by a citadel erected in the modern taste. It contains thirteen churches, eleven monasteries, and two nunneries. One of its churches is collegiate, and belongs to the order of Aviz; it has also an academy of history, antiquities, and languages, founded in 1747; one house of mercy, one royal hospital, and two others.

Setubal, by the Dutch and English called St. Ubes, is a strong town, seated about twenty-two miles to the south of Lisbon, on a small bay, into which the river Sandao discharges itself; and has a harbour capable of receiving ships of any burthen. Besides its old walls and towns, it is strengthened with eleven whole, and two demi-bastions, with several other out-works. It has likewise a strong citadel called St. Philip's, in which is a spring of excellent water; with the fort of Outao near the harbour, which also serves for a light-house; and two smaller forts. In it are four churches, one house of mercy, one hospital, ten convents, and an academia problematica founded by John V. The town is under the jurisdiction of the order of St. James.

S E C T. VIII.

Of the Province of Beira; its Situation, and Extent; with a particular Account of the Mountain of Estrella, the Produce of the Country; and its principal Towns.

BEIRA is one of the largest provinces of Portugal, it being bounded on the north by the provinces of Entre Douro e Minho and Trazos Montes; on the east by Estremadura and Alentejo; and on the west by the sea. Its extent from east to west is about one hundred and two miles, and about the same from north to south. It is divided into Upper and Lower Beira, the former being the northern part, and lying on the sea-coast, and the latter towards Spain and Estremadura.

The mountain of Estrella, the Mons Herminius of the Romans, is very remarkable. The ascent from Villa St. Romæo at its foot, up to the summit, takes up two hours and a half. In several places it is found to be hollow, and the noise of a rapid stream running through it is distinctly heard. It has also a fine quarry of alabaster, and on the top the traveller is agreeably surprised to find verdant pastures and rivulets of a very clear and pleasant water; but what is most worthy of attention, is a lake environed with high rocks, the water of which issues out of the ground, and is very clear and tepid, with a kind of tremulous motion in the middle; and from the strong attraction towards one certain place, it is conjectured that it has an aperture through which it runs off again, and is the spring of another lake a little lower; and from these is formed a river that takes its course to the foot of the mountain. The snow of a deep valley in one part of it

furnishes Lisbon the whole summer, though it is at the distance of above sixty leagues.

This province produces wheat, rye, and millet; and in several parts excellent wine and oil, in such plenty, that considerable quantities of each are exported.

This province contains four cities, two hundred and thirty-four towns, a thousand and ninety-four parishes, and in 1732 it had five hundred and fifty-one thousand six hundred and eighty-six inhabitants. John V. erected it into a principality in honour of his grandson, the eldest son of the prince of Brazil. The principal places in this province are the following:

Coimbra, a city on the river Mondego, formerly called Colimbria, or Conimbriga, contains eleven thousand nine hundred inhabitants, a cathedral, nine parish-churches, eight convents, eighteen colleges, among which the Jesuits college was extremely large, and esteemed the finest edifice in the place. There are also one house of mercy, and an hospital. The cathedral and the rest of the churches and monasteries are handsome buildings, well adorned and beautified; but the streets and private houses have no great elegance in them, and, as the city stands on the side of a hill, they are generally uneven. Among the other public buildings is the bridge, which is a fine structure built with stone, and consists of two rows of arches, one above the other, forming a covered way, through which people pass without being exposed to the weather. The aqueduct which brings water to the city, is also admired.

The bishop is suffragan to the archbishop of Braga; but has under him no less than three hundred and forty-three parishes. Here is an university, which is a magnificent structure, and has a rector, a governor, a chancellor, who is always prior of the convent of Santa Cruz in this city, with other professors and officers. The number of students is said to be two thousand. Here is also a court of inquisition.

The country about this city is extremely pleasant, and well planted with olives and vines.

The city of Lemego is situated near the river Douro, in a low country surrounded with mountains, and contains about four thousand four hundred inhabitants, two parish-churches, including the cathedral, four convents, one house of mercy, and an hospital. Its bishop is suffragan to the patriarch of Lisbon.

Aveiro is seated on a small bay into which the Vouga discharges itself, seven leagues to the south of Oporto, and nine to the northward of Coimbra. It has a harbour fit for ships of burthen, and is separated from the sea by sand-banks, with several little islands in which salt is made. The town consists of five wards, the fourth of which is the most antient, as well as the principal, and is walled in. The inhabitants amount to about four thousand four hundred, and the town contains four parish-churches, six convents, a house of mercy, and an hospital.

S E C T. IX.

Of the Province of Trazos Montes; its Situation, Name, Extent, Produce, Rivers, and principal Cities.

THE province of Trazos Montes is bounded on the north by Galicia, and on the east by Leon in Spain; on the southward also by Leon, and the province of Beira last described; and on the westward partly by the province of Entre Douro e Minho, and partly by Beira. It obtained its name from its situation with respect to the province of Entre Douro e Minho, it lying on the other side of the mountain of Marao. Its extent from north to south is about ninety miles, and from east to west about sixty. It is for the most part mountainous, wild, barren, and thinly inhabited; but has fertile and delightful valleys, that produce wheat, rice, fruit, and wine.

Besides the Douro, which divides the north east part from Leon, and then turning to the westward divides it almost into two equal parts, it has the rivers Tamega, Corgo, Tuela, and Sobor; all which run into the Douro.

It contains two cities, fifty-seven towns, five hundred and forty-nine parishes, in which were computed, in

1732, a hundred and thirty-five thousand eight hundred and four persons; and is divided into twenty-four jurisdictions, the principal places in which are,

Miranda de Douro, thus called from its standing on that river, to distinguish it from Miranda in Castile: it is strongly situated on a rock, in a barren mountainous country, at the confluence of the Douro and the little river Fresno, and, besides its works, is defended by a castle and fort; it being a place of importance, as it opens a passage into the province of Leon, which lies exposed to incursions on this side. It is a city and bishop's see, though the only church in the city is the cathedral, and it contains no more than about seven hundred inhabitants, a house of mercy, an hospital, and one seminary. To the district of this city belong twenty-two parishes.

Braganza, the antient Brigantium, is seated thirty-two miles to the north-west of Miranda, in a spacious plain near the river Travença. It is divided into the city and the town; the former is surrounded with walls and towers, and has within it a good castle; the latter is also fortified, and has a fort on an eminence which covers them both. The whole consists of two parishes, two monasteries, as many nunneries, a house of mercy, and an hospital. Braganza is the capital of a celebrated duchy belonging to the present king of Portugal, whose ancestors were dukes of Braganza, the most illustrious house among the nobility, they being descended from their antient kings. This place has a variety of silk manufactures, and is one of the most antient cities in the kingdom. The district of this city includes no less than a hundred and twenty-three parishes.

Chavez, or Chaves, a pretty good fortified town on the river Tamega, twenty-seven miles to the west of Braganza, is supposed to have been built by the emperor Vespasian, who gave it the name of *Aquæ Flaviæ*, and it has still some traces of its antient extent and grandeur. It is situated two leagues from the frontiers of Galicia, and is defended by a double wall and two forts, one of which has the appearance of a citadel, and contains a convent within it. Between the town and the suburb called Magdalena is a Roman bridge of stone over the river Tamega, above ninety-two geometrical paces in length; but not much above three in breadth. The town has one collegiate church, which is also the parish-church, two convents, and two hospitals.

Villa Real, the best and largest town of the province, is seated fifteen miles to the north-east of Lamego, between two small rivers which discharge themselves into the Douro. The greatest part of the houses stand without the walls, and the few within them are called the Old Town. It has two parish-churches, three convents, and an hospital.

S E C T. X.

Of the Province of Entre Douro e Minho; its Situation, Extent, Produce, and principal Towns; with a particular Description of the Cities of Porto and Braga.

THIS province receives its name from its being situated between the Douro and Minho; it being separated by the river Minho from the Spanish province of Galicia on the north, and by the river Douro from the province of Beira on the south; the province of Trazos Montes bounds it on the east; as does the Atlantic ocean to the west. Its extent from north to south is about sixty-seven miles, and from east to west about forty-five.

This province is naturally well defended, it being separated from Spain on the north and east by rivers and almost inaccessible mountains, and on the west washed by the ocean. The inhabitants enjoy a sweet serene air, and an almost perpetual spring; but they have little grain, and that chiefly rye and millet: however, the country abounds in wine and fruit; and its rivers, which discharge themselves into the sea, with its good harbours, particularly those of Porto and Viana, are so convenient for trade, that in proportion to its extent it is the most populous province in the whole kingdom. The principal places it contains are the following:

Guimaraens, a town which owes its origin to a convent of Benedictines, built there in the year 927. Its

walls are eighteen hundred and fifty paces in circuit, and it contains four parishes, two of which are in the suburbs, six convents, besides another a little way out of the town, three hospitals, one house of mercy, and five thousand inhabitants.

Viana is situated near the mouth of the river Lima, fifteen miles to the west of Braga, and is a large, well-built, and strong city, defended by the castle of St. Jago. It contains seven thousand inhabitants, two parish-churches, seven convents, one house of mercy, and an hospital; but its harbour is only fit for small vessels.

Porto, Oporto, or Port a Port, is situated in forty degrees fifty-three minutes latitude, and eight degrees thirty-five minutes west longitude, eight miles to the south of Braga, on the side of a rugged mountain, the foot of which is washed by the Douro, and is about a league distant from the mouth of that river, which here forms a good harbour; but it has a very difficult entrance, from the rocks and sands, which form a bar, that can only be got over at high water, with the assistance of a coasting pilot. The harbour is safe against all winds; but when the floods or freshes in the river come down, no anchor can hold, at which times the ships are fastened to each other along the walls, in order to avoid the impetuosity of the torrent. The streets are well paved; but the inequality of the ground on which the city stands, renders it not very pleasant to walk in them. A fine quay runs along the banks of the river, close to which the shipping lie, so that a merchant may see his vessels unloaded from his own windows. It is fortified with an old wall and towers, and defended by a castle. In opulence, populousness, beauty, and commerce, it is the next city in the kingdom to Lisbon, and has an arsenal, docks, and yards, for building and fitting out men of war. It has four suburbs and seven parish-churches, including the cathedral, it being the see of a bishop, twelve convents, besides four others without the walls, some hospitals, one house of mercy, and above twenty thousand seven hundred inhabitants. The most elegant building in the city is the convent of the Augustines, in which is a beautiful gallery of a vast extent: the church belonging to it is of a circular form, and very richly adorned. Here is also one of the sovereign councils or courts of the kingdom.

On the south side of the river opposite to Porto is Villa Nova do Porto, a small town near the place where the old town of Gaya formerly stood, in respect to which it is called Villa Nova. It contains only one parish-church, one house of mercy, one hospital, and one convent, with two others near the town, and about two thousand nine hundred inhabitants.

Braga is an antient archiepiscopal city seated, according to F. Capassi, in forty-one degrees thirty-three minutes north latitude, and in eight degrees forty-four minutes west longitude, thirty-two miles to the north-west of Porto, in a pleasant plain between the rivers Cavado and Deste, and received its name from that of a kind of garment worn by its antient inhabitants. It is said to have been built by the Greeks; but afterwards fell under the power of the Carthaginians, Romans, Swabians, Goths, Moors, and the kings of Leon. The Romans gave it the title of Augusta, and the Swabian kings honoured it with their residence. The city contains four parish-churches, besides its antient large cathedral, eight convents, a seminary, a house of mercy for persons of both sexes well-born who are come to decay, and are settled in it for life, or provided for with wonderful privacy, and an hospital. Its inhabitants amount to about twelve thousand three hundred. The houses are generally old substantial stone buildings, but have no great elegance, any more than the archbishop's palace and the cathedral, which are more admired for their antiquity and extent, than for their beauty. The archbishop is both spiritual and temporal lord of the place, on which account he has a sword, as well as a cross, carried before him. His revenue is forty thousand ducats per annum, and he is primate of the kingdom. In this city are some stately remains of antique buildings, particularly of an amphitheatre and an aqueduct. The country about Braga produces corn, wine, and fruit; and here is a great deal of pasture, on which they feed large flocks of sheep.

S E C T. XI.

*Of the AZORES, or TERCEIRAS.**Their Names, Situation, Number, Climate, Produce, with a Description of each.*

AS the Azore Islands are situated in the Atlantic ocean opposite to Portugal, to which they belong, and are never included under the American islands, we can no where more properly place them than here.

The Azores, Terceiras, or Flemish Isles, derived their first name from the great number of hawks and falcons found there by the Portuguese at their first discovery; the second from Terceira, the name of the principal island; and the third from the Flemings, who discovered them much about the same time as the Portuguese.

These islands are situated to the west of Lisbon, between the thirty-sixth and fortieth degree of north latitude, and between the twenty-fifth and thirty-third degree of west longitude from London. They are nine in number, and are named Santa Maria, St. Miguel, Terceira, St. George, Graciosa, Fayal, Pico, Flores, and Corvo.

All these islands enjoy a very clear and serene sky, with a salubrious air; but are exposed to violent earthquakes, from which they have frequently suffered; as they have also by the violent agitations of the waves by which they are surrounded. They are, however, extremely fertile in corn, wine, and a variety of fruit; and likewise breed large quantities of cattle.

Santa Maria is distant about two hundred and fifty Portuguese miles, or rather leagues, from Cape St. Vincent in Algarve, and was discovered in 1342 by Gonzalo Velho Cabral, and is about four miles long and three broad, with a harbour to the south-west defended by some redoubts. The principal place in the island is a small town named Porto, besides which there are a few villages.

St. Miguel is the first of the Azore islands in the passage from Lisbon, and lies about two hundred and twelve Portuguese miles from Cabo de Espichel. It was discovered in 1444, on the festival of the appearance of St. Michael, which occasioned its being called by this name. It is eighteen miles in length, and two in breadth. Its two principal harbours, named Ponta Delgada and Villa Franca, lie on the south side. This is the best peopled of all the Azore Islands, the inhabitants being said to amount to above fifty-one thousand five hundred, besides about thirteen hundred and ninety ecclesiastics, monks, and nuns; and though it has not long been entirely cultivated, it is the most fruitful, particularly in corn and wine; so that one year with another the wheat amounts to twelve thousand bushels, the millet to near as much more, and its wine to about five thousand pipes. This island contains one city, five towns, and twenty-two villages.

Ponta Delgada, the capital, is seated in a level country, on an open harbour defended by a fort, and contains about eighteen hundred and eighty hearths, three parish-churches, and seven convents, the palace of the governor, the custom-house, and poor-house.

Villa Franca, the most antient town in the whole island, is so called from its being at first a free port. An island about a mile in circumference lies before the harbour, and towards the sea the town is defended by a fort and some other works. It has eighteen hundred and thirteen hearths, two parish-churches, and two convents; with nine villages belonging to its jurisdiction.

In the year 1720 a little island appeared between St. Miguel and Terceira, which has since gradually vanished.

Terceira is the third island that was discovered, and is thirteen miles long, and six broad. The harbour of Angra, its capital, is two hundred and forty-five Portuguese miles distant from Lisbon; and the island is divided into two captainships, which contain one city, two towns, and several villages.

The city of Angra is situated on the south-east coast of the island. Its harbour is formed by a bay situated between two capes, the one lying west, and the other east, about a quarter of a mile from each other, and both about twice that distance from the town. On the west cape stands Fort St. Sebastian, and on a high mountain, called the Mount of Brazil, Fort St. John the Baptist. The harbour is spacious, and has good anchorage; but is exposed to the south-east winds. It is a populous city, in which are broad, straight, clean, and well paved streets, a cathedral, five other churches, and one poor-house, an hospital, and eight convents. The bishop of this place has all the nine islands of the Azores under him, and is himself suffragan to the patriarch of Lisbon. This city has the privilege of sending a representative to the cortes or assembly of the states.

St. George is situated about eight Portuguese miles or leagues from Terceira. To the north it is little more than a high rock, but in other parts the eminences and plains succeed each other. It is eleven miles long, and one and a half broad, exclusive of its two capes. On the south it has a harbour for small vessels. It is said to have been discovered on St. George's day, 1450. The south side of the island is well cultivated and inhabited, and has three towns and four villages. The principal town, named Vela de Velas, is but small, and has only one church, one convent, and the above harbour.

Graciosa lies directly east and west, and is about ten miles in length and seven in breadth, and contains two towns; the principal of these is Santa Cruz, which is seated on a bay that forms a harbour named Calheta, defended by a fort, and contains one church, one house of mercy, and a convent. This island is said to have received its name from its remarkable fertility.

Fayal is nine Portuguese miles in length, and three in its greatest breadth. The chief place in the island is Villa de Horta, situated on its western coast, which has an harbour land-locked on all sides, except to the east and north-east; and is defended by several forts. The town contains one parish-church, and five convents; and the island contains ten other parishes.

Pico is sixteen Portuguese miles in length, and five in breadth. This island is visible at a great distance on account of the height of its mountain, to which it owes its name, and which is said to rise three miles above the surface of the sea. This island is on the north separated from that of St. George, by a channel in some places six, and in others twelve miles over; and to the west from Fayal by another channel. Its principal harbour is at Villa Das Lagens; the second, which is called Magdalene, is only for small vessels. This island carries on a great trade in its excellent wines, and in wood, with which it also abounds, particularly in cedar, and in a firm red wood that is highly esteemed.

Flores, the next island, is about thirty miles long, and nine broad; but has only two towns, and a number of villages. The principal place is Santa Cruz, which is small, and contains only one church and a convent.

Corvo lies to the northward, opposite to the island of Flores, from which it is divided by a strait about three miles in breadth. The whole circuit of this island is but about ten miles, and the whole coast consists of a chain of rocks. It has two small harbours, one church, and an insignificant place called Nossa Senhora do Rosario, which is subordinate to the church of Santa Cruz, on the island of Flores.

C H A P. XXVIII.

Of the Kingdom of F R A N C E.

S E C T. I.

Its Name, Situation, Extent, Climate, Mountains, Minerals, Fossils, Rivers, Fruits, Vegetables, and Animals.

FRANCE obtained its present name from the Franks, who in the fifth century passed out of Germany into Gaul, and made themselves masters of the whole country, from the Rhine to the mouth of the Loire. This kingdom is bounded by the British channel, and the Netherlands, towards the north; on the east by Germany, Switzerland, and Italy; on the south by the Mediterranean sea, and Spain, from which it is separated by the Pyrenean mountains; and on the west by the Atlantic ocean; extending from the forty-third to the fifty-first degree of north latitude, and from the fourth degree west to the seventh degree east longitude. Did not the province of Bretagne extend itself above an hundred miles farther into the ocean, than any other part of the kingdom, it would be nearly of a square form, and the breadth and length almost equal, that is, about five hundred and forty miles; but allowing for the hills and valleys, with the winding of the roads, it would in a traveller's account be above six hundred miles over either way.

The air is mild and wholesome, particularly the interior parts of the kingdom. The winters, however, in the northern provinces are cold, and last four or five months. Indeed the cold is in that season generally much severer there than in England; for we being surrounded by the sea are less subject to continued frosts, and are besides better provided against the cold from our being much better supplied with firing. They have, however, the advantage of clear settled weather, and are but little troubled with fogs, which are so disagreeable in Great Britain and other countries. The summers in France are hotter than with us.

France, with respect to its situation, has the advantage of every kingdom in Europe, the seas which border upon it affording the inhabitants an easy communication with the rest of the world; the northern shores being washed by the British channel, the western coast by the Atlantic ocean, and the south by the Mediterranean. Hence no country can be better situated for the advancement of trade and navigation.

The chief mountains of France are the Alps towards Italy, the Pyrenees, which border on Spain, and those of the Cevennes and Auvergne.

With respect to minerals, Languedoc is said to have veins of gold and silver. In Alsace these metals have been found in the sand of the Rhine; and the mountain of Wasgau, in that province, yields a silver ore, which is worked, and farther discoveries are making after it. Plenty of iron ore is found in various parts of the kingdom, and in Alsace are mines of lead. Pit-coal is principally found in Hennegau, and all parts of the kingdom make salt-petre. Here is also no want of marble; for since Colbert's time, quarries, particularly in Languedoc, Provence, and Bourbonnois, are kept continually open. France, however, produces few gems; but has in Languedoc a mine of excellent turquoises.

The country is extremely well watered with navigable rivers, the chief of which are the Loire, the Rhone, the Garonne, and the Seine. Of these the Loire is the largest. It rises in the mountains of the Cevennes, and taking its course north and north-west, runs to Orleans; and from thence directly west by Tours, Angers, and Nantes, falling into the Western ocean forty miles below the last city; having received in its course the Allier, Cher, Indre, Creuse, Vienna, and the Maine; and has a communication with the Seine, by means of the canals of

Briare and Orleans. Its whole course, with all its windings, is computed to be about five hundred miles.

The Rhone rises in the mountain of La Fourche, in the province of Uri in Switzerland, and running westward through the country of the Valais, passes through the lake of Geneva; and having visited that city, flows south-west to Lyons, where it joins the Soan, and then runs south till it falls by three several channels into the Mediterranean.

The Garonne receives its course in the mountains of Aure, in the county of Comenges. It becomes navigable at Muret, and, after being joined by several rivers, changes its name into the Gironde; and at length discharges itself by two outlets into the Atlantic ocean. This river has a celebrated canal, by which the Western ocean is joined to the Mediterranean.

The Seine rises near Dijon, in Burgundy, and running to the north-west visits Troyes, Paris, and Rouen in its way, and at length falls into the British channel near Havre de Grace.

The country of France is in general fertile, yet has many barren tracts and mountains. In some parts it produces plenty, and in all of them a sufficiency of the necessaries of life. In plentiful years it yields more corn than is necessary for the subsistence of the inhabitants; but a bad harvest is generally succeeded by a scarcity, and in war-time there has been often a great dearth of grain, which is the more felt in this country as bread is the principal food of the inhabitants.

Their roots differ much from ours; for here are no round turnips; theirs are long and small but well tasted, and being not so strong as ours, are more proper for their soups. They have few potatoes; but plenty of Jerusalem artichokes. They abound in vast quantities of large red onions and garlic; and also in shallots, rock-amboule, and leeks. These last are smaller than ours; but three times as long in the white part. Lettuces are the great and universal salad. In April and May the markets are served with vast quantities of white beets. Asparagus is here very plentiful; and they are so fond of sorrel, that large fields are planted with it. They are also particularly fond of mushrooms, of which they have several different kinds.

This kingdom enjoys great plenty of wine, which is produced in all its provinces. Among the several French wines that of Champagne is reckoned the best, it being a good stomachic, racy, and in taste and flavour exquisite, with an agreeable tartness. That of Burgundy, the best of which is produced about Beaume, has a fine colour, and a pleasant taste. The wines of Angers and Orleans are also delicate, but a little heady. In Poitou is produced a white wine that resembles Rhenish. The neighbourhood of Bourdeaux and the lower parts of Gascony produce excellent wines. Pontac grows in Guienne. Muscadel and Frontinac are the delicious products of Languedoc. Between Valence and St. Valliere, along the banks of the Rhone, is produced a very agreeable, but roughish red wine that has a taste not unlike that of bilberries; it is named hermitage, and is esteemed for its wholesomeness.

The territories for oil of olives are Provence and Languedoc. These and other provinces produce saffron, and the northern parts in particular have large orchards, and make great quantities of cyder, which is there the common drink of the inhabitants. Bourdeaux exports great quantities of prunes, and capers are principally produced in the country about Toulon. Flax and hemp thrive in several parts of the kingdom; but linseed is produced only in the north. Most of the provinces abound in wool, and silk is cultivated with great industry, especially in Languedoc, Provence, Lionnois, and Dauphiné; and,

and, during all the time in which the inhabitants attend on the silk-worms, public prayers are offered up for the prosperity of those useful insects.

France also produces horned cattle, sheep, and hogs; but they are neither so numerous, nor in general so fat and fleshy as those of Great Britain. Good horses are also produced here, as well as asses, and a great number of mules. Game and wild-fowl are in the greatest plenty, and extremely good. The people on the sea-coast employ themselves in fishing. The Pyrenean mountains furnish timber for ship-building, great quantities of which are also purchased out of Alsace, Burgundy, and Lorraine; but in the other provinces the scarcity of timber and wood for fuel begins to be more and more felt. This kingdom also produces plenty of sea and spring-salt.

S E C T. II.

The Persons, Dress, Food, Manners, and Customs of the French. Their Religion, Arts, Manufactures, Commerce, and Coin.

THE French are generally slender, nimble, active, and well-proportioned; their hair and eyes are for the most part black, their complexions brown, and the ladies fond of giving a high colour to their cheeks. The people in general are merry, sprightly, and seldom lay any thing to heart; they are familiar, and acquainted with a stranger at first sight; but many are extremely vain, and most of them remarkably talkative. The common people are in general extremely extravagant in their dress, though they live as meanly as possible with respect to provisions.

The French are far from eating the same quantity of flesh that we do, nor do they often dress it in the same manner, fricassees, ragouts, hashes and soups disguised with onions, herbs, and spices, are preferred before joints boiled or roasted; and what they do boil or roast has scarce a drop of gravy left. They keep their meat before they dress it till it is very tender: for as their meat is leaner, drier, and more stringy than ours, their keeping it longer not only makes it less tough, but improves the taste; especially as the dryness of the air preserves it from that disagreeable mustiness which stale meat acquires by the dampness of our moister climate. But as the French eat much less meat than we, and are excessively fond of soup, they usually eat twice the quantity of bread, which is generally exceeding light and good. As they are strangers to the fine fat sirloin and rump of beef, and other large joints which in Great Britain grace the tables of people even in middling circumstances, they are unacquainted with the many English dishes called by the general name of puddings. The wealthy, however, supply this deficiency with sweetmeats, and a number of little delicacies; but the poor mechanics, and all the labouring part of the nation, live almost entirely on soups and vegetables. In Lent the common people feed much on white kidney-beans, that is the seed boiled, and on white lentils, a sort of pulse not known in England; and a variety of sallads, some of which grow wild in almost every field.

The French are so far from being addicted to jealousy, that it is good manners to commend the beauty of a woman, and to extol her charms even before her husband's face. The women in general behave without reserve. The French are much commended for their obedience to their governors, and pride themselves on their profound veneration for their prince; but while the people had any thing to contend for, rebellions and civil wars were as frequent in France as in any other country. They had once the privilege of making their own laws; but their privileges are swallowed up by the prerogatives of the crown, and their parliaments are of little use with respect to their legislative capacity, except to register the edicts of the sovereign, which they may indeed remonstrate against, and present their petitions to have them rendered more favourable to the people; but if the king continues obstinate, they are at last obliged to submit. Their lands are so highly taxed, that small estates will scarce afford the proprietors a subsistence, who

have not a place; and indeed there is scarce a considerable family in the kingdom that has not some preferment in the church, the army, or the court.

The nobility and gentry of France never apply themselves to trade; they seem indeed naturally designed for the court or the army; and if they happen to be of a melancholy disposition, here are always convents, and numerous preferments to be met with in the church. As to their military virtues, it must be acknowledged that they do not want bravery, and have brought the art of war to great perfection, there being no people upon earth who attack or defend a place better than they, or are better skilled in fortification. As to their exercises, there are few French gentlemen who do not learn to dance, to fence, and to ride the great horse. The usual diversions of the French are gaming, of which they are very fond, walking, or taking the air in coaches, and attending plays and operas.

The French tongue is formed out of that of the Gauls, Romans, and Franks, with the additions and refinements made in it from time to time by persons of genius, till it arrived at its present perfection.

The established religion in France, since the repeal of the edict of Nantes in 1685, is the Roman Catholic; yet in Dauphiné, Languedoc, and other provinces, there are such a number of secret Protestants, that they have been computed to amount to no less than three millions; but those, on account of their religious assemblies, at which sometimes great numbers have been present, have been cruelly harrassed and persecuted; and in 1745 some Protestant preachers were hanged, laymen were sent to the galleys, women to the convents, and children forced away from the arms of their parents. The French Protestants now perform their public worship with as much secrecy as if it were a crime to hear the Gospel read, and to offer up their devotions to their Maker; for this purpose they meet in private cellars and caverns remote from public view. The clergy are frequently very active in persecuting them; but outward compulsion is lodged in the hands of the temporal magistrates alone, who are seldom backward in lending their assistance when it is required by a priest. In Alsace, however, the Protestants are openly tolerated by virtue of a treaty, and in many places even the Jews.

The privileges of the Gallican church, or the church of France, are pretty considerable. The principal of these are the following:

I. In temporal affairs, and such as relate to government, neither the sovereign, nor his officers, or magistrates, are subject to any church-discipline, inflicted either by the bishops or even by the pope himself.

II. The pope has no other jurisdiction in France than what the king is pleased to grant him; his nuncios and legates à latere are only considered as envoys from the court of Rome to that of France, and cannot in virtue of any papal mandate interfere in affairs of justice, unless such mandate has previously received the king's sanction, and has been formally registered in parliament.

III. The calling and holding all ecclesiastical assemblies, with the confirmation of their decrees, depends on the civil power, without requiring the knowledge and consent of the pope.

IV. The king is impowered to enact laws that merely concern the ecclesiastical constitution, and to limit the exercise of the power of the clergy; and without the king's permission and ratification, no law of the church, either by the bishops or the pope, can subject any one to outward penalties or punishment, or even to church-discipline.

V. The pope can levy no money in France, on any pretence whatever, except the fees and imports allowed him by the *concordat*; though the king can tax the clergy without standing in need of a papal mandate, a privilege which other princes must purchase by paying a quota of such tax to the see of Rome. It is but lately since the king enjoined the clergy to pay the twentieth penny, and for that purpose to deliver in an inventory of their estates and incomes. This indeed occasioned a great ferment, till in 1753 the clergy consented to pay the king the annual sum of twelve millions of livres, under the

name of a free gift; without being exempted from the usual free gift which they bring to the throne every five years.

VI. No ecclesiastical foundations, nor any new order of monks and nuns, are to be introduced without warrant from the king; and the rules of such order are subject to the cognizance and amendment of the civil power.

VII. The king nominates all archbishops and bishops, abbots and priors, except with respect to the latter, where the convent is indulged with the choice of its superior.

VIII. The ecclesiastical jurisdiction is so far subordinate to the civil power, that appeals from the sentences of the ecclesiastical courts are received by the parliament.

In the whole kingdom are eighteen archbishops, a hundred and thirteen bishops, twenty-two thousand two hundred and ninety-one priests, seven hundred and seven abbeys for men, three hundred and seventeen abbeys and priories for women, besides a great number of other convents, together with two hundred and fifty commanderies of the order of Malta, among which are six grand priories, and four principal commanderies. The annual revenues of the archbishops and bishops amount in the whole to four millions three hundred and thirty-seven thousand livres. The number of monks and nuns is computed in the whole at above a hundred and ninety thousand, whose income is said greatly to exceed a hundred millions of livres. The ecclesiastical state is composed of eighteen provinces, each of which consists of an archbishopric, and the bishops subordinate to it.

The French have always distinguished themselves by their skill in the arts and sciences. Painting was first brought to great perfection among them under Francis I. when Roux and Francisco Bolognese introduced all the beauty of that art into France; and since that time this kingdom has produced several eminent masters. In 1648 was instituted at Paris the royal academy of painting and sculpture; but it is said that the ingenious art of painting is now on the decline in France; and is supported by a frivolous taste, which is far from tending to the improvement of the liberal arts. Engraving has been brought to a perfection yet unequalled in any other part of Europe. France has also made great advances in statuary. It has also been famous for its architects; and the great Colbert, in 1671, founded a royal academy of architecture, who now hold their meetings in the Louvre. The French learned the art of ship-building from the English. Their reputation in military architecture is well known, and they also excel most nations in gunnery and fire-works. At Paris, besides the antient university and royal college, are four academies, namely the French academy, the academy of inscriptions and belles lettres, that of surgery, and the academy of sciences, with three others for the education of young noblemen. Besides these there are eighteen other universities in France, and several academies for the sciences and the polite arts.

The French manufactures and productions are supported and improved with the greatest diligence. By the advice of the above-mentioned Colbert, that wise encourager of manufactures and the liberal arts, Lewis XIV. erected the manufacture of the Gobelins at Paris, which is so called from two brothers, Giles and John Gobelin, who under Francis I. found out the method of dying a most beautiful scarlet, which was afterwards called by their name. The house of the Gobelins at Paris is full of the works of the most excellent masters in tapestry, filigree, and sculpture; and in the article of tapestry alone no less than two hundred persons are constantly employed. There are also considerable manufactures of tapestry in several other parts of the kingdom. The French historians inform us, that silk manufactures were first set up in France in the reign of Lewis XI. yet in the time of Henry II. silk was so scarce, that the king was the first who had ever been seen with a pair of silk stockings on, which were a part of his dress at the marriage of his sister. The succeeding kings made good regulations with respect to the culture of silk, and the planting of white mulberry-trees; but it was not till the time of Lewis XIV. that this was brought to any considerable degree of prosperity; and under his government the quantity of raw silk produced in the province of Dau-

phiné, Languedoc, and Provence alone, annually amounted to one million eight hundred thousand pounds weight. However, the revocation of the edict of Nantes has been of the greatest detriment to this trade, by compelling the manufacturers to fly from France, to seek that protection, and to enjoy that religious liberty, which they were not allowed to possess at home. Hence the art of weaving silk is become almost universally known, and England has been enabled to surpass in the elegance and beauty of their patterns the French themselves. Within these last hundred years the French have considerably improved their woollen manufactures, in which they have been assisted by the clandestine exportation of wool from Great Britain and Ireland. Hence the cloths and other woollen stuffs made at Abbeville, are little inferior either in fineness or goodness to the English. Several provinces abound in manufactures of linen, thread, and sail-cloth; and at Cambray is made the fine and beautiful linen called Cambray linen, or cambric; and St. Quintin excels in its lawns. The glass manufacture is also of great advantage to France. In 1688 one Abraham Thevert contrived a method for casting better and larger plates of looking-glass than had been before known. Vincennes has also a manufactory of very handsome porcelain.

The trade of France is very considerable, though it is nothing near so great as it was formerly: it consists of gold and silver brocades, gold and silver embroideries, silk stuffs, sattins, sewing silks, crapes, cambric, lawn, fine linen, laces, toys, and millinery-ware, tapestries of various kinds, fine cloths, plush, woollen stuffs, sail-cloth, looking-glasses, drinking-glasses, paper, parchment, scythes, knives, and other hard-ware; wines of many sorts, vinegar, brandy, corn, hemp, flax, walnut-tree wood, pot-ash, pitch, turpentine, oil of turpentine, linseed oil, and oil of olives, almonds, raisins, chestnuts, figs, prunes, capers, nuts, honey, saffron, salt, mules, &c.

The navigable rivers are of great advantage to the inland trade, and these have been joined at a vast expence by canals, the most famous of which is the royal canal in Languedoc. The coast trade is very considerable; for by this the maritime provinces reciprocally supply each other with their own produce. The land trade is carried on with Swisserland, by the way of Lyons; to Germany, through Metz and Strasburg; to Holland, by the way of Lisle; and to Spain, by the way of Perpignan and Bayonne. The French ports on the Channel and the Western ocean are frequented by all the trading nations of Europe. The trade with England, the United Provinces, and Italy, is of great advantage to France. However, but few French ships are seen in the ports of the northern nations. Their trade on the Mediterranean with Asia and Africa has for some years been very considerable, and the far greatest part of it is carried on by the city of Marseilles alone. They also carry on a considerable traffic to Guinea for gold, ivory, and slaves for their American colonies. The East India trade is in the hands of a company at Port L'Orient, in Brittany.

Accounts are kept in France in livres, sous, and deniers. One livre contains twenty sous, and one sou twelve deniers. The French livre is nearly of the value of ten-pence, one sou is worth a half-penny, and consequently the denier is the sixth part of a farthing. Three deniers make a liard, which is also a small piece of copper.

The French silver coin is the ecu, or crown, equal to three livres; sixty sols, or seven hundred and twenty deniers, equal to our half-crown. One louis blanc is five shillings.

The gold coin are the louis d'or, of one pound value; there are also double and half louis; and a pistole is eight shillings and four-pence.

S E C T. III.

A concise History of France. The Titles of the King; his Succession to the Throne: His Arms, Coronation, Ensigns of Royalty; the different Orders of the Nobility, and of Knighthood; the Parliaments; the great Officers of the Crown

Le Hall sculp.

Murder of the Duke of Burgundy.

Crown and of the Household; the great Councils of State, and Courts of Justice; the Laws, Taxes, Land Forces, and Navy of France.

FRANCE was antiently inhabited by the Celtæ, on whom the Romans first conferred the name of Gauls, and Julius Cæsar reduced the country into a Roman province. In the fifth century the Burgundians, Visigoths, and Bretons, settled in several parts of Gaul. These were followed by the Franks from Germany, who under Merovie and Childeric conquered a part of Gaul, and under Clovis extended their dominion from the Rhine to the mouth of the Loire: for king Clovis, who was baptized in 496, quelled the Burgundians, Visigoths, and inhabitants of Brittany.

At this time the kingdom of the Franks was divided into Austrasia, or the east part, and Neustria, or the west; and on the decease of Clovis, his four sons divided their father's kingdom among them.

The lands of Gaul were on their being conquered by the Franks distributed among their officers, and these with the clergy formed the first great councils or parliaments. Thus the government appears to have been a mixed monarchy, in which nothing of moment was transacted without the grand council of the nation, consisting of the principal officers, who held their lands by military tenures: while the conquered Gauls were reduced to a state of servitude, and manured the lands for the Franks.

This was the constitution of the government, till Charles Martel in 732, usurped the sovereignty. This nobleman was marshal of France, or mayor of the palace, and had long exercised the sovereign power in the name of Childeric, a weak and indolent prince. The Saracens, who had made themselves masters of the south of France, penetrating into the heart of the kingdom, he entirely defeated them, and driving them out, was considered as the deliverer of Christendom: he there became so popular, that with the consent of the people, and even of the pope, he assumed the dominion of France; and having a victorious army at his command, not only deposed the king, but rendered himself an absolute prince, by depriving the nobility and clergy of their share in the government.

His son Pepin succeeded him in the throne, but restored the privileges of the nobility and clergy, on their agreeing to exclude the former race of kings. He also divided the provinces among his principal nobility, allowing them to exercise sovereign authority in their respective governments; till at length assuming a kind of independency, they only acknowledged the king as their head: and this gave rise to the numerous principalities, and their several parliaments, every province retaining the same form of government that had been exercised in the whole; and laws were made, or taxes raised, without the concurrence of the nobility and clergy.

Charlemagne, or Charles the Great, the son of Pepin, conquered Italy, Germany, and part of Spain, and was crowned emperor of the Romans, by pope Leo, in the year 800, and from him was descended the race of kings, called the Carolingian line. About eighty years after the death of Charlemagne, the empire was divided from France, and that country suffered much from the invasion of the Normans.

The Carolingian race of kings continued sovereigns of France till the reign of Lewis V. when in 987, Hugh Capet, a popular nobleman, assumed the throne, and began the Capetian line of monarchs. Crusades, or expeditions to the Holy Land, for the recovery of Jerusalem from the Saracens, being preached up by order of the pope, the princes of every kingdom in Europe engaged in these falsely called Holy wars, in which Christianity was to be propagated by fire and sword; and in which several hundred thousand Christians perished: but though they at length took Antioch, Jerusalem, and several other strong places, they lost them all again within two hundred years. Lewis IX. with most of the nobility, was taken prisoner in Egypt, in one of these expeditions, and their ransoms cost an immense sum.

In 1285, the kingdom of Navarre was added to the crown of France, by the marriage of Philip IV. with Jane queen of Navarre. During this reign the constitution of the government received a considerable altera-

tion; for the nobility and clergy refusing to grant the king the supplies he demanded, he summoned the deputies or representatives of the commons to parliament, and on their granting him what he wanted, constituted them a third state.

In 1344, Hubert count dauphin of Vienne transferred his dominions to the crown of France, on condition that the king's eldest son should ever after be styled dauphin.

Edward III. king of England, laying claim to the crown of France, on account of his being descended in a direct line from Philip IV. invaded that kingdom; and in 1346, obtained a complete victory at Cressy in Picardy, and the next year took Calais. In 1356, the French were again defeated at Poitiers, by Edward the Black prince, the eldest son of Edward III. and king John and his son Philip brought prisoners to England.

At length the French king Charles VI. being seized with a kind of phrensy, and becoming unfit to govern, the dukes of Burgundy and Orleans contended for the administration, and the quarrel grew to that height, that the duke of Burgundy caused the duke of Orleans to be assassinated in the streets of Paris, which laid the foundation for a civil war. About the same time Henry V. king of England, invading France, obtained a victory at Agincourt in 1415. The French now proposed a reconciliation between the duke of Burgundy and the family of Orleans; and a conference was held between the young duke of Orleans and the duke of Burgundy, to accommodate matters; but at a second conference, the dauphin and the duke of Orleans caused the duke of Burgundy to be murdered. Upon this the queen and the young duke of Burgundy joined the English, with whose assistance king Henry made an almost entire conquest of France; and a parliament being held at Paris, the king of England was made regent of France, during the life of the French king Charles VI. declared successor to that crown; and at the same time married the princess Catharine, the French king's daughter. King Henry dying, and leaving an infant son, that infant was crowned king of France at Paris, in 1431; but Charles the dauphin also causing himself to be proclaimed king, recovered all the countries that had been taken by the English.

In the year 1498, died Charles VIII. the last of the first line of the house of Valois, on which the crown descended to Lewis XII. duke of Orleans. Three of his sons succeeded him in order. Under the first, namely Francis II. the religious disputes began to break out in France, the Protestants were persecuted, and under Charles IX. these disputes occasioned two civil wars; after the conclusion of which, on the 18th of August 1572, was perpetrated the barbarous massacre of Paris, which left an indelible stain on the history of France. Afterwards king Henry III. being thought to favour the Protestants, was assassinated by one Clements, a monk. His legal successor was Henry IV. king of Navarre, the first of the house of Bourbon, that sat on the throne of France: but he being a Protestant, was obstinately opposed by the popish party; and though he changed his religion in order to please his subjects, yet having passed the edict of Nantes, for the toleration of the Protestants, he was assassinated in 1610, by one Ravilliac, a monk, in the streets of Paris.

Lewis XIII. a minor of nine years of age, succeeding to the throne, Mary of Medicis, his mother, was declared regent. She continued to invade the liberties of the subjects, and revived the persecution against the Protestants, which occasioned another civil war. Cardinal Richlieu, being about this time introduced into the ministry, entirely subdued the parliament of Paris, and put a final period to the liberties of the people.

On the death of Lewis XIII. and that of cardinal Richlieu, which happened about the same time, his son Lewis XIV. succeeded to the throne, and in his long reign carried the power of France to its greatest height. To his kingdom he added the provinces of Alsace and Roussillon, with a considerable part of the Netherlands, Franche Comté, or the earldom of Burgundy, and the principal city of Orange. He also enlarged his dominions in America and Asia, and placed his grandson Philip of Anjou

Anjou on the throne of Spain, while navigation and manufactures were improved throughout the kingdom. But the bravery and skill of the great duke of Marlborough set bounds to his conquests, which had been carried on with the utmost cruelty; and in particular on his invading the Palatinate of the Rhine in 1689, he burnt and destroyed all the fine towns in that country. He also repealed the edict of Nantes, and began a severe persecution against the Protestants, who fled into England and other countries, where they set up silk manufactures.

Lewis XIV. was succeeded by his great grandson Lewis XV. the present king, on the first of September 1715, and was crowned at Rheims on the 25th of October 1722. But we shall not here recapitulate the accounts of his reign, which are fresh in every one's memory.

The title of the king is Lewis XV. by the grace of God king of France and Navarre. The title of sire or lord, is given him by his subjects, as a mark of his unlimited power; and foreigners style him the most Christian king, or his most Christian majesty; but the king's subjects are not to make use of it. Since the year 1349, when Hubert count dauphin of Viennois, as hath been already intimated, united his country to the crown of France, the king's eldest son, and presumptive heir to the crown, has been styled dauphin.

According to French writers their king never dies, but as soon as his eyes are closed, the next prince of the blood succeeds to the throne, and is instantly invested with the supreme authority; but where the king is a minor, that is, before he has entered the fourteenth year of his age, the administration of the government is entrusted to a regent, usually the queen-mother, or a prince of the blood, according to the determination of the parliament at Paris, in which the rest of the kingdom generally acquiesce. But if the deceased king has appointed a regent by his will, that is seldom disputed.

When a new king enters into his fourteenth year, he goes in great state to the parliament of Paris, attended by the princes of the blood, the peers, and general officers of state. This assembly is generally called his bed of justice, and here he is declared to be of age; yet the regent frequently procures himself to be constituted prime minister, and under that title still continues to govern the kingdom till his majesty thinks fit to take the reins of government into his own hands.

The arms of France are three fleurs de lys or, in a field azure, supported by two angels in the habit of Levites, each holding in his hand a banner with the same arms: the crest is an open crown: the whole under a grand azure pavilion strewn with fleurs de lys, or, and ermine, and over it a close ground with a double fleur de lys or, on the sides of which are flying streamers, on which are written the words used in battle, *MON JOIE S. DENNIS*, and above them on the royal banner or oriflame, *LILIA NON LABORANT NEQUE NENT*; that is, the lily neither labours nor spins; which is supposed to be an allusion to the Salique law that excludes females from the supreme command.

The coronation of the king is performed whenever the court thinks fit. He is usually crowned at Rheims, by the archbishop of that city, assisted by five other ecclesiastical peers, and six noblemen, who represent the six ancient lay peers of France. The oil with which the king is anointed, according to a ridiculous tradition, was brought from heaven by a dove, and is kept in a phial called the Holy Bottle. The crown of Charlemagne is first placed upon the king's head; but being very heavy, it is exchanged for another. The other ensigns of royalty are the sceptre, which he wields in his right hand, and the hand of justice, which he holds in the left; the latter is a staff about two feet long, at the end of which is an ivory hand: this is chiefly used at the coronation, and the sceptre alone on other days of ceremony.

The nobility of France are divided into four classes: the first includes only the princes of the blood, consisting of the house of Orleans, and the two branches of the family of Bourbon, those of Condé and Conti. Next to these immediately follow the king's natural children who have been legitimated, and these precede all the nobility of the kingdom. To the second class belong the high nobility, as the dukes and peers of the realm, of which there

are forty-five in all, including the six princes of the blood, who are peers by birth. The principal duties and privileges of the peers are, the giving their assistance at the anointing of the king, their attending when he holds a bed of justice, and their enjoying a seat in the parliament of Paris, which is from hence called the court of peers. To this class also belong the other dukes, counts, and marquises, the principal officers of the court and other departments; the knights of the Holy Ghost, the governors of provinces, lieutenant-generals, bailiffs, &c. The third class is composed of the common ancient nobility, who in some provinces, particularly in Languedoc, are styled nobles; but in most of the others *ecuyers*. These are divided into the noblesse de race, and the noblesse de naissance; the first are those whose ancestors have been for a hundred years at least in possession of employments which confer nobility; and the second are those nobles whose ancestors were created such, and from whose patent it appears that they were commoners. In the fourth class are the new nobility, whom the king has either raised by patent, or ennobled by their employments: thus the officers of the crown, the king's secretaries, the counsellors of the parliament of Paris, and of other high tribunals in that city, are classed under this rank. The *etchevins*, or chief magistrates of the several cities are also ennobled. The military nobility are also of this class. The nobles enjoy particular privileges, they being exempted from paying the poll-tax, from the quartering of soldiers, the duties of franc-fief, with other privileges of less importance.

The highest order of knighthood is that of the Holy Ghost, founded in 1578 by king Henry III. the ensigns of which are a gold cross, with a white dove enamelled on one side in the middle, and on the other the image of St. Michael, appendant to a blue ribbon, passing from the right side to the left. The knights also wear on the left breast of their coats a silver cross, with a dove embroidered argent. The temporal knights are also knights of the order of St. Michael, and the greatest part of them likewise of that of St. Lewis.

The order of St. Lewis was instituted in 1693 by Lewis XIV. Its ensign is a gold cross enamelled argent, and adorned with golden lilies. On one side of it is a coat of mail with this inscription, *LUD. M. INSTIT. 1693*. On the other is a drawn sword, with a wreath of laurel at its point, and the motto *BELL. VIRTUTIS PRÆM.* Those called the *grands croix*, or great crosses, wear it on a broad flame-coloured ribbon over the shoulder, having also a gold embroidered cross on their coat. The commanders wear it in the same manner, but without the embroidered cross. The other knights wear the cross appendant to a narrow flame-coloured ribbon, fastened to a button-hole. Those knights of the Holy Ghost who are at the same time knights of the order of St. Lewis, wear the cross of the latter, with a narrow red ribbon near the cross of the Holy Ghost. Of the ten *grands croix*, each has a pension of six thousand livres per annum. Each of the ten commanders has four thousand; of nineteen others each three thousand, thirty knights have each two thousand, thirty-two others have each fifteen hundred, sixty-five others have each a thousand, and fifty-four others have each eight hundred.

The order of St. Michael was instituted in 1469 by Lewis XI. and revived in 1665 by Lewis XIV. The knights wear a gold chain of double scalloped shells, with a medal representing a rock, on which is represented St. Michael encountering the dragon.

The religious order of St. Lazarus owes its origin to the Holy Land, after the reduction of which by the Saracens the knights returned to France, where Lewis VII. in 1137, bestowed settlements on them at Boigni, Orleans, and St. Lazarus at Paris, which grant was confirmed in 1265, by St. Lewis. This order is divided into two grand masterships, one of which resides in France, and the other in Savoy. The knights wear a temporal habit, and are allowed to marry. In 1607 Henry IV. instituted the order of Our Lady of Mount Carmel, and united it with the order of St. Lazarus, which union was confirmed by Lewis XIV. The sovereign himself is grand master of the three first orders; but he nominates one for the fourth.

Formerly nothing of consequence in relation to the state was decreed or enacted without the consent of the three states of the kingdom, consisting of the representatives of the clergy, the nobility, and the representatives of the citizens; but these assemblies are entirely abolished, and have never been convened since the year 1614. The courts in which justice is now usually administered, are first the parliaments, which are the last resort when the court does not interpose. These are at present twelve, namely, those of Paris, Toulouse, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rennes, Pau, Metz, Besançon, and Douay. They principally consist of a certain number of presidents and inferior judges, who purchase their places either of the crown, or of those who are in possession of them: for all magistrates and officers of justice in France openly purchase their places, and the government makes a considerable revenue by these sales. They enjoy their posts for life, except they have been guilty of some crime in the exercise of their offices. The parliament of Paris is the most considerable in the kingdom, for hither the king frequently comes in person, and here the royal edicts are recorded and promulged; till when they have not the force of laws. It is composed of the princes of the blood, dukes, and peers of France, besides the ordinary judges, and takes cognizance of all offences committed by peers, where the court does not interfere.

This parliament consists of ten chief presidents, some honorary counsellors, or judges, four masters of the requests of the household, twenty-one presidents *a mortier*, so called from the form of their caps, and of two hundred and thirty-two other counsellors or judges; an attorney general, advocates, solicitors general, registers, notaries, secretaries, &c. These members are distributed into the grand chamber, five chambers of enquests, and two of requests. Besides these eight chambers there is another called the *tournelle*, which takes cognizance of criminal matters, in which the nobility are not concerned; for they are tried in the grand chamber. In the chambers of enquests depositions of witnesses are taken, and the proceedings are by way of bill and answer, as in the court of chancery in England; and the chamber of requests takes cognizance of causes relating to privileged persons. On days of ceremony the presidents of parliament wear a scarlet robe with a mantle lined with ermine, and a black velvet cap in the form of a mortar, bordered with gold lace; that of the chief presidents being distinguished by a double gold lace. The honorary counsellors, the masters of requests, the presidents of enquests and requests, the attorneys, and solicitors-general have scarlet robes, and caps bordered with ermines. The chief register for civil causes has a scarlet robe and mantle lined with ermines. The chief register for criminal causes, the four notaries, and the clerks or secretaries of parliament have also scarlet robes, and caps lined with ermines. The advocates have black gowns and caps, and all the rest of the officers have only black gowns.

The great officers of the crown are the chancellor, who presides in all courts and councils of state in the king's absence; the keeper of the seals, four secretaries of state, the marshals of France, the colonel-general of the horse, the great master of the artillery, the admiral of France, two vice-admirals, the general of the galleys, the four great officers of the order of the Holy Ghost, namely the chancellor, the master of the ceremonies, the great treasurer, and the secretary; the chief presidents of the several parliaments, with the governors and lieutenant-generals of the provinces.

The principal officers of the household are, the great master of the household, the great master of the horse, the great almoner, the great chamberlain, the gentlemen of the bed-chamber, the great butler, the great huntsman, the four captains of the guard du corps, and the great porter.

The great councils by which all affairs of state are governed are seven in number.

I. The supreme council of state, in which, besides the king and prime-minister, when there is one, it is composed of the three secretaries of state, and the comptroller-general of the finances.

II. The secretary of state's office, in which, besides the king, the dauphin, and prime-minister, sit the chancellor, the president of the council of finances, the four secretaries of state, and the comptroller-general of the finances. Here all affairs of the provinces are transacted; commissions, letters, and orders sent to the governors and other officers of the several provinces and cities. The secretaries of state make the motion, and every one expedites the resolutions taken on the articles of his department; the foreign and domestic affairs of state being divided among the members.

III. The council of finances, besides the king and chancellor, consists of a president, one of the six intendants of the finances, a member of the council of state, and the comptroller-general of the finances. This council has the direction of the royal revenues.

IV. The privy-council is convened by the chancellor on such days as he pleases. In the king's absence there is always a chair set for him. This council at present consists of the chancellor, or keeper of the great seal, twenty-one ordinary counsellors of state, the secretaries of state, the comptroller-general of the finances, the intendants of the finances, who are all ordinary members, and twelve state counsellors, who officiate only half yearly. The ordinary state-counsellors have each a salary of five thousand five hundred livres, the half yearly three thousand three hundred. In this council also assist twenty-two masters of requests, who belong also to the parliament, and lay before it any affairs committed by them.

V. The grand council, which has the decision of all causes relating to archbishoprics, bishoprics, and abbeys; and has also the power of determining all disputes of the other sovereign tribunals, in matters of jurisdiction and other contents. The president is the chancellor of France, assisted by several presidents, counsellors, and other officers.

VI. The high court of chancery consists of the keeper of the great seal, who is frequently the same with the chancellor of France; of four grand audiençiers, who peruse papers sent from the secretary of state's office to be sealed, and make report to the chancellor; of four comptrollers-general of the audience, who give the papers allowed to be sealed to an officer called *chauff-cire*, or chaff-wax, and receive them back from him; and four keepers of the rolls of the offices of France, who keep the registers of all the officers that require the great seal, with several clerks and other officers.

VII. The council of commerce, the members of which, besides the king and prime-minister, are the chancellor, two secretaries of state, and the comptroller-general of the finances.

Justice is administered in the kingdom by inferior, middle, and superior courts: to the inferior courts belong the prevotes, mayors, judicatures, chatellanies, and other jurisdictions dependent on the crown, or particular lordships. From these appeals lie to the bailiwicks, or precinct courts, and from these again to the provincial courts. The middle tribunals pronounce definitively in certain small cases both civil and criminal; but the more important cases are cognizable only by the parliament, which decides causes in the last resort.

With respect to the laws by which justice is administered, the civil law prevails in many of the provinces; while others have their own customary laws. Those of principal note among the latter are about sixty; but, including the juridical customs of single places, they make about two hundred and eighty-five. Besides these, there are ordinances, edicts, and declarations, which are of universal force. In 1666, under Lewis XIV. the civil and criminal processes were amended, and reduced to a general uniformity.

A strict distinction is made in France between the canonical and papal ecclesiastical law; and by the obligatory canons, or church ordinances, are only understood those canons of the first ages of Christianity, and the œcumenical councils, that have been confirmed by the consent of the churches bound by them, which could not be transacted without the approbation of the civil power. Thus the interpolated decretals of the see of Rome are absolutely

absolutely excluded. The king's ordinances issued for the protection of the liberties of the Gallican church, constitute the most considerable part of the ecclesiastical law.

The revenues of the king are both ordinary and extraordinary. The ordinary revenues comprehend the domains, which consist in lands, lordships, and forests: the aids or duty on wines, which are the twentieth part of the wine sold by wholesale, and the eighth or tenth of that retailed: the gabelle, or salt-duty, which is here extremely high. The province of great salt-duty contains the departments of Alençon, Amiens, Angers, Bourges, Caen, Chalons, Langres, Laval, Mans, Moulins, Orleans, Paris, Rouen, St. Quentin, Soissons, and Tours; in all which salt is sold at a high rate. The province of the small salt-duty includes the departments of Lyonnois, Dauphiné, Provence, Languedoc, Roussillon, Rouergue, and Auvergne, in which salt pays a much lower duty. The provinces where the salt-duty does not take place are Poitou, Limousin, Guienne, Gascony, and Brittany. In the three bishoprics of Metz, Toul, and Verdun, and in French Compté, the price of salt is different. The other duties are the taille, or land-tax, the capitation, or poll-tax; the customs of all kinds, the duty on stamped paper, &c.

With respect to the customs, wine-license, salt and stamp-duty, tobacco, posts, &c. they are farmed out to the farmers-general, who have their under farmers and receivers. The great officer for levying the taxes is the comptroller-general, who keeps a duplicate of all receipts and discharges relative to the royal revenue.

The extraordinary impositions are of what number and kind the king pleases. Among these is the augmentation of the tax for the support of the army, the taillon, the tenth or twentieth part of the revenue of the whole kingdom in lands, houses, offices, &c. and the erection and sale of new offices.

The ambition and extensive views of France, with its various wars, have necessarily burthened the subjects with enormous taxes and impositions; and these being aggravated by the rapacity of the financiers and farmers, the people have often been reduced to the last extremity of wretchedness, from which, without the many resources nature and industry have put into their hands, they could never have recovered.

The number of people in France in the reign of Lewis XIV. were computed at twenty millions; but the persecution and expulsion of the Protestants, with the many wars in which the French have been engaged, have probably reduced the number to fifteen millions; for the celibacy of the priests, and the numerous convents, must ever prevent their increase, so as to supply the deficiencies made by the ravages of war.

The ordinary revenues of the crown, arising from the above taxes, amount to about ten millions sterling. An amazing sum, considering the lands belonging to the church, and what is paid to support the clergy; and the many thousand drones who, shut up in convents, are supported by the labour of others.

The land forces of France amount in time of peace to about two hundred thousand men, among which are a great number of Swiss, Germans, and other foreigners; and in time of war they are frequently augmented to four hundred thousand. The number of fortresses belonging to the kingdom is very great, and exact plans of them, as also of the foreign fortresses, to the number of a hundred and eighty, may be seen in the gallery of the Louvre, where there is a royal academy for training up young gentlemen in the several branches of the art of war. Besides the magnificent building of the invalids in the capital, where disabled seamen are admitted, there are in the whole kingdom above seventy other military hospitals.

The navy of France is also very considerable. Classes are instituted throughout all the maritime provinces, where the sea-officers and sailors, and others belonging to the navy, reside. Each class serves three or four years alternately, and those who are not in actual service on board the king's ships, may enter on board those of the merchants. In the beginning of the late war, France had a hundred and eleven men of war. Besides the sailors, there are three companies of marine guards stationed

at Toulon, Brest, and Rochfort, consisting entirely of persons versed in navigation, and the art of war. Another company has been erected under the title of guards of the admiral's flag, who always attend the admirals, and serve only on board flag ships. These are chosen out of the marine guards just mentioned. The king also maintains one hundred independent companies for the sea, each consisting of forty-five men, under the command of a lieutenant of a man of war.

France is now divided into thirty-six generalities, or general governments, in describing which we shall begin at the south-east of this extensive country.

SECT. IV.

Of the Situation, Extent, Climate, Produce, and Rivers of Provence; with a Description of its principal Cities, particularly Aix, Arles, Marseilles, Toulon, the Islands of Hieres, and the little State of Avignon subject to the Pope.

PROVENCE, which derives its name from the Latin Provincia, is bounded on the north by Dauphiné; on the east by the Alps and the river Var, which divide it from the territories belonging to the king of Sardinia; on the south by the Mediterranean; and on the west is separated from Languedoc by the Rhone. Its utmost length is about a hundred and forty miles, and its breadth from the isles of Hieres to the village of Sauze about ninety.

Upper Provence enjoys a pretty temperate air, and has a great deal of meadow ground, well stocked with cattle. It also produces corn, apples, and pears, though but little wine. On the contrary, Lower Provence is extremely hot, and near the sea-coast would be much more so, were not the air refreshed by a breeze, which usually lasts from nine or ten in the morning till evening. The north-west wind also cools the country, and sometimes, particularly after rains, blows fresh. Lower Provence does not produce half corn enough for the subsistence of its inhabitants; but the soil being dry and sandy, oranges, lemons, pomegranates, and olives; with mastich, cypress, palm, and the African acacia-trees, thrive extremely; as do also shrubs of all kinds, such as bruc, which resembles box, only the leaves are longer and more pointed, bearing a red fruit, which continues on all the year round, and by a peculiar singularity proceeds out of the middle of the leaf. The sea-cherry-tree has a leaf like the algermes, and its fruit resembles a cherry. The wine in Lower Provence is thick, luscious, and heady; but the sort most admired is muscadell.

In this part of France is the beccafigo, a small delicious bird, that feeds only on grapes and figs; and among the sea-fish here is a remarkable kind called the date, which is so named from the resemblance of its shape to that fruit, and is found within hollow stones in the road and harbour of Toulon. In order to get them out, the stone must be broke; they also abound along the coast of the marquise of Ancona, on the Adriatic. In this province are some quarries of black agate.

The rivers here are inconsiderable; these are the Durance, the Sourse, the Largens, and the Var, which divides France from Italy. Along the coast of the Mediterranean are several capes, bays, and harbours; the principal of which is Toulon.

Authors have variously divided this province; some French geographers divide it into two parts, some into three, and others into sixteen; we shall take that which is the most natural and least liable to perplex the reader, by dividing it into Upper and Lower Provence, and shall begin with the latter, the principal places in which are the following:

Aix, in Latin *Aquæ Sextiæ*, called *Aquæ* from its baths, and *Sextiæ* from its being enlarged and beautified by Sextus Calvinus. This city, which is the capital of Provence, stands in a valley of considerable extent planted chiefly with olives, in the latitude of forty-five degrees fifty-four minutes, and in six degrees ten minutes east longitude, twenty miles to the northward of Marseilles, and thirty-five to the south-east of Avignon. It is rather populous than large; the streets are well paved, and the houses

houses handsome, and most of them built of free-stone: there is a beautiful spacious walk within the city called *Orbitelle*, consisting of three rows of trees a mile long, interspersed with fountains, and on each side are elegant uniform buildings: this is the usual walk of the citizens. This city is the see of an archbishop, who enjoys a revenue of thirty-two thousand livres, out of which he pays to the court of Rome two thousand five hundred florins. In the cathedral is a consecrated rose of gold, the present of pope Innocent IV. to count Raymond Berenger. In this city are also two colleges, with an university founded in 1409, an academy of the polite arts erected in 1668, a public library in the town-house, eighteen convents, a palace formerly the residence of the counts of Provence, and now of the high bailiff. Here is also a mint, and this city is the seat of a parliament, of a chamber of accounts, a court of taxes, and many other public offices. The nobility of Provence reside here, especially in winter, so that this city is said to have the most agreeable company, next to Paris, of any place in the whole kingdom. In its suburbs the warm mineral spring, once so celebrated, was found a second time in 1704, but its ancient virtues are much decayed. The country in its neighbourhood produces excellent wine; but its principal trade consists in its fine oil; some stuffs are also made here.

Arles, the antient *Arellas*, *Arelata*, and *Arelatum*, is a large and well built city, seated on the east bank of the Rhone, in the forty-third degree thirty-two minutes north latitude, and in the fourth degree forty-five minutes east longitude, upon very uneven ground, and almost surrounded by a morass, which renders the air thick and unhealthful. Over the Rhone is a wooden bridge, to preserve the communication with Languedoc. The cathedral is a vast Gothic structure, charged with an infinite number of figures, and the high altar is adorned with a tabernacle of silver, an admirable piece representing the martyrdom of St. Stephen, to whom the church is dedicated. The archbishop styles himself prince of Montdragon, has a province of fifty-one parishes, and an annual revenue of thirty-three thousand livres, out of which his taxation to the court of Rome is two thousand and eight florins. Besides the cathedral, it contains one collegiate, and seven parish-churches, with an abbey, fourteen convents, an hospital, and a royal academy of sciences founded in 1688. The town-house is an elegant regular structure, finely situated. It is of a square form, adorned with three orders of architecture, one above another; the portico is magnificent, and embellished with the busts of the counts of Provence, and the roof supported by twenty double columns.

Arles was antiently the capital of the kingdom of Burgundy, which was also called the kingdom of Arles, and the district belonging to this city is still very extensive. Several councils have been held here, the most antient and distinguished of which was in 1314.

Among the numerous Roman antiquities to be found at Arles is a large obelisk of porphyry, which was dug up here in the year 1673, and in 1676 set up again and dedicated to Lewis XIV. It is of one entire stone, fifty-two feet high, and seven feet in diameter at the base. On the top is placed an azure globe, strewed with golden lilies, and a sun, which was that prince's device; but its new plain pedestal of sand-stone ill agrees with the valuable monument above.

There are also the ruins of an amphitheatre, supposed to have been built by Julius Cæsar; it is of an oval form, and a hundred and ninety-four fathoms in circumference, the longest diameter of the area seventy-one fathoms, and the shortest fifty-two. The porticos are three stories high, built of free-stone of a prodigious size; each story contains sixty arches, which still remain, and the walls are of a surprising thickness, but very much decayed. However, this fine monument of antiquity is almost entirely concealed by the private houses built about it. There is here also the fragment of a circus, consisting of a door, with two columns of marble of the Corinthian order; the remains of a Roman capitol erected here, and a large collection of Roman sepulchral monuments, urns, and the like, kept in the archbishop's

palace; among which is an urn of very extraordinary dimensions, it containing above twenty gallons.

Near the city is what they call the Elysian Fields, and there the Romans used to bury the ashes of their dead. Accordingly there are here seen an incredible number of stone and marble sarcophagi, some standing half, and some entirely out of the ground. These fields afterwards became a Christian cemetery. The spot on which they stand may be called a mine of antiquities.

Near the city the Rhone divides itself into two large branches, forming the island of Camargue, called in Latin *Camaria*, which is one of the best and most fruitful tracts in this country, it being intersected with several canals.

Marseilles, in Latin *Massalia*, and *Massilia*, the second city of Provence, but the first in point of trade, is large, rich, and the most ancient place in all this province, and is said to have been a town five hundred years before the birth of Christ. It is seated at the foot of a rocky mountain near the sea, in forty-three degrees eighteen minutes north latitude, and in five degrees twenty-seven minutes longitude, twenty miles to the south of Aix, and thirty to the north-west of Toulon. It is divided into the Old and New Town: the former stands on an eminence, and consists of narrow crooked streets, with mean houses; but in the latter the streets are straight and broad, and adorned with handsome edifices. The Walk is a very fine street, with beautiful houses on each side, and in the middle two rows of lofty trees, which form a fine vista; and there are here a number of benches for resting places. This city is the residence of a high bailiff, and has a bishop, suffragan to the archbishop of Arles, who has a diocese containing thirty-six parishes, with an annual revenue of thirty thousand livres, and his taxation at Rome is seven hundred florins. This city has also a mint, with four parish churches, including the cathedral, which is said to have been a temple of Diana, and the most ancient in France, and two collegiate ones, with two abbeys, an academy of the polite arts, and an observatory. This city also contains a large arsenal, well stored with materials for fitting out the king's galleys. The large armoury, which consists of four walks crosswise, and is esteemed the finest in the whole kingdom, contains arms for forty thousand men. In the arsenal is a dock for building the galleys, which is roofed over, and has a communication with the harbour, which is in the form of a parallelogram, and has public and private buildings on the two long sides, and on one of the shorter. The other, which opens into the Mediterranean, is defended on each point by a fine strong fort. The entrance into the harbour, on account of a rocky cape near it, is difficult, and has not a depth of water sufficient for men of war.

On the land-side is one of the most beautiful plains in the world, in which there are said to be no less than eight hundred country-seats of the citizens with their gardens and vineyards, whither they retire from the noise of the town, which is very disagreeable from the multitude of slaves in the streets rattling their chains, some of whom serve as porters, and others have little shops and huts, where they are allowed to work at their trades.

Gold and silver stuffs are made here, and almost all the trade of France with Spain and Italy is carried on by Marseilles, which is also the center of the commerce of the Levant. To Italy the inhabitants export cloths, serges, honey, figs, prunes, olives, capers, fresh eels, a species of small sardines, oil, sail-cloth, aqua vitæ, cotton waistcoats, stockings, &c. and the returns are made in silk, hemp, sulphur, manna, anise, corn, and rice. To Spain they export all kinds of linen, silk, wool, gold and silver stuffs, gold, silver, and thread lace, with several home and Levant commodities; and their trade in silk to Constantinople, Smyrna, Athens, Candia, the Archipelago, Tripoli, and Alexandria, is very considerable. In the year 1720, this city was visited by a most dreadful pestilence, which raged till 1722.

Toulon, a pretty large city, seated in a bottom, almost encompassed with hills on the land-side, and on a bay of the Mediterranean, which forms a secure and commodious

dious harbour, in the latitude of forty-three degrees five minutes, and in the sixth degree two minutes east longitude; near four hundred miles south-east of Paris. It is defended by very strong fortifications towards the land-side, and the new part of the town is very handsome. The bishop of this city is subject to the archbishop of Arles, under whom he has a diocese of twenty-five parishes, with an annual revenue of fifteen thousand livres, out of which his taxation at the court of Rome is four hundred florins. Besides the cathedral, it has nine convents, a seminary, and a college, under the direction of the fathers of the Oratory, and the Jesuits had here a very fine house. The old and new harbour lie contiguous, and by means of a canal you pass from one to the other, both having an outlet into the spacious outer harbour, which is surrounded with hills, and formed by nature almost circular. Its circuit is of very great extent, and at the entrance on both sides is defended by a fort with strong batteries. The new harbour, which was made by order of Lewis XIV. is also well defended by batteries, and round it stands the arsenal, where every man of war has its own particular store-house; but the guns and cordage are laid up separate. In it are also spacious work-houses for blacksmiths, joiners, carpenters, lock-smiths, carvers, &c. The rope-house, which is built entirely of free-stone, is six hundred and forty yards in length, with three arched walks, in which as many parties of rope-makers may work at the same time. The general magazine, which supplies whatever may be wanting in the particular storehouses for single ships, contains an immense quantity of all kinds of stores, disposed in the greatest order. The cannon foundry is also worth viewing.

In the year 1707, the duke of Savoy laid siege to this city, but without success; and in 1721, it suffered greatly by the plague. The inhabitants make a kind of coarse woollen cloth, and its neighbourhood abounds in capers.

Hieres, the ancient *Areæ*, a small town, formerly much more considerable than at present; it having once an harbour where pilgrims used to embark for the Holy Land. This town has a district court, and several public offices; it also contains one collegiate, with two other parish churches, and five monasteries and nunneries. The soil is excellent, and being laid out in orchards, produces the finest fruit in France. A great deal of salt is made here, both from sea-water and a large salt lake; but the air was unwholesome, till this inconvenience was remedied by forming a canal, which extends from the lake to the sea.

This town gives name to the islands of Hieres, which lie in the neighbouring sea, and in conjunction with the continent, form a fine road. These islands are three in number. The principal, which lies nearest the town is Porquerolles, so called from the great number of wild hogs, which swim over hither from the continent, for the sake of the acorns, abundance of oaks growing here. It is four French leagues in length, one in breadth, and is defended by an old castle. The second is Portecroz, that being the name of the harbour where a fort is built. The third is called Titan, or Levant, from its situation to the eastward of the former; but though it is four French leagues in length and one broad, it is uninhabited. On these islands are said to be found the most curious medicinal plants of all the species that grow in Italy, Spain, Greece, and Egypt.

Frejus, the ancient *Forum Julii*, is a fortified city seated on the river *Argent*, at the distance of a mile and a half from the sea, and thirty-six miles to the north-east of Toulon. It has a court of admiralty, and is the see of a bishop, suffragan to the archbishop of Aix, and has within his diocese eighty-eight parishes, with a yearly revenue of twenty-eight thousand livres, out of which he is taxed one thousand florins at the court of Rome. This city contains four convents. Among the remains of Roman antiquities, there are here an aqueduct of considerable length, and an amphitheatre.

The principal place in Upper Provence is Sisteron, a city that has a small citadel, seated at the foot of a rock on the *Durance*, thirty miles to the south-west of Em-

brun, and is the see of a bishop, suffragan to the archbishop of Aix, who has sixty four parishes, and a revenue of fifteen thousand livres per annum, and his taxation at the court of Rome is eight hundred florins. Here is a cathedral and five convents, and on the other side of the river is a pretty large suburb called *La Baune*, which contains one parish church, and one convent.

Though the state of Avignon belongs to the pope, yet the greatest part is surrounded by Provence; and as the natives of Avignon enjoy the privileges of natives of France, it is proper to give that country in this place. The country we are now to describe is very delightful, and particularly abounds in corn, wine, and saffron. It is subject to few taxes, and pays only the tenth of its produce; so that the annual expence of the vice-legat, and the militia, exceed the income arising from it to the court of Rome. The French farmers-general have, by means of a sum of money, obtained the monopoly of salt and tobacco in this country, though that trade is still carried on in the pope's name.

Avignon, in Latin *Avenis*, is situated on the river *Rhone*, about twenty miles to the north of Arles, and is surrounded with a wall of fine free-stone; but has little trade, especially since the manufacture of printed linen, which afforded a comfortable subsistence to great numbers of the inhabitants, was suppressed in favour of the French East-India company, who purchased this prohibition of the pope by paying him a considerable sum. The vice-legat, as governor, usually resides in the papal palace, which is a large structure of free-stone, encompassed with moats; but is far from being a regular edifice. The arsenal is a long lofty building, but without any other fire arms than what are just necessary to be discharged on public rejoicings. The upper court of the vice-legat is called the *Rota*, and has a right of appeal to Rome. The cathedral, which stands on the same eminence with the palace, is not very large. In two chapels are to be seen the monuments of pope Benedict XII. and John XXII. and also the chair or throne of the ancient popes, during their residence here. In the church of the *Celestines*, are fine paintings of the pretended miracles performed by cardinal Peter of Luxemburg, to whom the church is dedicated. In this church is also a splendid chapel, and a monument in it erected in honour of some shepherds, who are said to have built the stone-bridge here over the *Rhone*. In the church of the *Franciscans*, is the tomb of the beautiful and learned Laura, immortalised by the poetry and passion of the celebrated Petrarch. In this town are two societies of Jesuits, to one of which belongs a fine college, with an university founded in 1303. The popes resided here from the year 1305 to 1377. In this city the Jews enjoy the free exercise of their religion.

S E C T. V.

Of the Province of Dauphiné; its Situation, Extent, Produce, and Singularities; its Medicinal Springs, Rivers, and Principal Cities, particularly Grenoble, Ambrun, Vienne, and Valence.

THE province of Dauphiné is bounded on the north by the country of *Bresse* and the river *Rhone*; on the east it is separated from *Piedmont* by the *Alps* and *Savoy*; on the south it borders on *Provence*; and on the west on the *Rhone*. It is nearly of a triangular form, and each side of the triangle is about an hundred English miles in length.

Lower Dauphiné produces corn, wine, olives, silk, hemp, salt, wood, vitriol, crystal, iron, copper, and lead; but Upper Dauphiné, and indeed above two thirds of the whole province, being very mountainous, are so barren, that great numbers of the natives seek for subsistence in other parts; yet these mountains have some useful products, and contain many curiosities. In those of *Ambrun* and *Die*, are found *marcasites*. The golden mountain, as it is called, yields a species of crystal. Several mountains are covered with larch-trees, on the rind of which is gathered *manna*, benjamin of a delightful fragrance

fragrance, and agaric, which is used in physic and scarlet dyes. These mountains abound in beasts that are not found in any other part of France, particularly the chamois, bear, and marmot, which have been already described, pheasants, hawks, eagles, &c.

Ancient historians and modern geographers give very pompous descriptions of the wonders of Dauphiné, which some represent as seven and others more. The first is the burning spring, on a hill nine miles from Grenoble. It is a little brook, which issues from a soil emitting smoke, and even small flames have been sometimes perceived in it, which communicated heat to the water; but for these two centuries past, this rivulet has altered its course to the distance of twelve feet from that igneous soil, and is now as cold as common water. The second is the tower without venom, about a league from Grenoble, it being pretended that no venomous creature will stay in it; but this is a notorious mistake, it being known to swarm with adders and spiders. The third is the inaccessible mountain, which is a steep craggy rock, situated on a very high mountain, about two leagues from Die. But though it is extremely difficult to climb up to the top of it, this has been frequently done. The fourth is the caves of Saffanage, which are two excavated stones, that lie in a grotto above a village of that name. The country-people relate, that annually on the sixth of January they become full of water, and that the quantity of it in one of these stones, foretels whether they shall have a good or bad winter, and the other prognosticates whether they shall have a good or bad harvest of corn. For several centuries past this story has been kept up by the artifices of some of the inhabitants, who themselves take care to fill the stones with water.

There are several other supposed wonders in this province, among which is a water fall in a grotto near the above caves, and the floating meadow in the lake of Pelhotiers; but this supposed meadow consists merely of grass and rushes cemented, as it were, together, by the slime of the water.

The waters of La Mothe in this province, are highly esteemed, as a certain remedy against all disorders of the stomach, fluxes, and even lameness, they being much better than the water at Aix, in Savoy. La Mothe is a valley about five leagues from Grenoble, that runs between two high mountains, and enjoys no other prospect but that of bare and steep rocks. The only dwellings here are wretched huts of straw, so that the country is in every respect disagreeable. The Drac, a very rapid river, proceeding from the high part of the district of Gap, is, as it were, squeezed in at La Mothe between two high rocks. On its shore, at the foot of a very steep rock, is the mineral spring, which if the river rises but half a foot, is covered with its turbid water. To come at the spring, a person must clamber half a French league over steep rocks and dreadful precipices, which seem to threaten the passenger with immediate destruction; and therefore it is no wonder that these excellent waters are but little frequented. There are several other mineral springs in this province.

The principal rivers are the Rhone, the Durance, the Isere, and the Drome. In this province are two archbishopricks, and five bishoprics. The civil law takes place here; the inhabitants have also particular customs of their own, and likewise a parliament, which is also a court of taxes, with one provincial court of justice, seven prefectures, three bailiwicks, four royal jurisdictions, and as many private lordships. The governor and lieutenant-general of the province sit in the parliament, and take place above the chief president. The principal places in this province are the following:

Grenoble, in Latin Gratianopolis, the capital of the province, is pleasantly seated at the foot of a mountain on the river Isere, near the place where the river Drac discharges itself into it. Here the parliament meets. This city has also an intendency, a chamber of accounts, a court of taxes, a mint, and a court of the lord-treasurer of France. It is a pleasant populous city, and besides other fortifications, is defended by a citadel, called the Bastille. The bishop of this place is suffragan to the archbishop of Vienne, and has a revenue of twenty-eight thousand livres, out of which he pays one thousand flo-

rins to the court of Rome. The river Isere divides the city into two unequal parts, the smallest of which is called La Perriere, and contains one parish church, and one convent. The name of the largest is Bonne; this is the most beautiful, it being built with straight handsome streets, and contains several magnificent public buildings; as the bishop's palace, the palace in which are held the courts of justice, the cathedral, the arsenal, and a general hospital.

The grand chartreuse, the most celebrated of all the convents belonging to the order of Carthusians, is seated on the Alps, at the distance of three leagues from Grenoble. There are two ways leading to it, but both are carried over steep rocks and precipices of a dreadful height, the terror of which is increased by the roaring of the river Guyer la Mort, during its precipitate course among them. The convent, which stands on an eminence resembling a meadow, is environed with rocks and mountains covered with wood, that rise to a much greater height. This convent forms a spacious oblong square walled in, and without it are a few inns and stables. In the large hall of this convent is annually held the general chapter of the order of the Carthusians, where the German priors take the precedence of all others; and at their arrival may ride into the court of the convent, which none of the rest are permitted to do; but, like strangers, must alight at the gate. In the hall are fine paintings, representing the life of St. Bruno, and likewise the pictures of the generals of the order. The former are copies of the admirable paintings in the Chartreuse at Paris. In a large gallery may be seen views of all the Carthusian convents in Christendom, mostly executed by eminent hands. The church is not large, but very magnificent; and among other relics it is said to contain the arm of St. Bruno, his body being interred in Calabria. The first settlement of Bruno and his disciples was half a league from this place, and it having no particular name, was so called from Carthreufe, a village situated near it in a valley, and which is still in being. From the kitchen of this monastery above a hundred persons are daily fed; and among them thirty monks and forty lay-brothers; and all strangers are entertained here gratis. The wine-cellar consists of two lanes lined with casks of an extraordinary size, and which being immoveable, are filled through the roof by means of leather pipes. This convent is the head of the order, and chooses the general, who is obliged to reside here during life.

Briançon, the capital of a territory called Briançonnais, is seated forty five miles to the south-east of Grenoble, on the side of a steep rock, on the top of which stands a castle; near the town the two little rivers of Dure and Ance unite their streams, and thus form the river Durance.

Ambrun, or Embrun, the capital of the territory of Ambrunois, is situated on a steep rock, at the foot of which runs the river Durance, and is about twenty miles to the south of Briançon. It is a strong place both by art and nature, and is the see of an archbishop, who styles himself prince and count of Ambrun, and baron of Guillestre and Beaufort, who has also one-half of the lordship and jurisdiction of the city. His annual revenue amounts to twenty-two thousand livres, and his taxation at the court of Rome is two thousand four hundred florins. The episcopal palace is the finest building in the city, which, besides the cathedral, contains five parish-churches, with a Capuchin convent, and had lately a college of Jesuits.

Vienne, in Latin Vienna Allobrogum, the capital of a district in Lower Dauphiné called Viennois, is a very ancient city seated on the Rhone, seventeen miles to the south of Lyons. It is of pretty large extent; but the streets are narrow and ill paved. The cathedral is a beautiful structure, and in it are three chapters. Here is also a priory, nine convents, one seminary, and there was till lately a college of Jesuits. The church of Notre Dame de la Vie is said to have been a Roman prætorium. The archbishop of this place enjoys the title of upper primate of Gaul, and his annual revenue amounts to twenty-two thousand livres, out of which he is taxed eighteen hundred and fifty-four florins at the court of Rome. In this city are made anchors and sword-blades, with other manufactures in iron and steel, and also paper-mills.

Valence, in Latin Valentia, the capital of a district called

called Valentinois, is seated on the Rhone, forty-eight miles to the south of Lyons, and is pretty well built: it is large, and one of the most antient cities in France, having been formerly a Roman colony. The bishop is subject to the archbishop of Vienne, and has an annual revenue of sixteen thousand livres, out of which his taxation to the court of Rome is two thousand three hundred and eighty-nine florins. The episcopal palace is a fine building: besides the cathedral, it contains one chapter, and three abbies; with six convents, and an university.

SECT. VI.

Of the Situation, Extent, Produce, and principal Rivers of Franche Comté; with a Description of Besançon, Salines, Dole, and Gray.

THE earldom of Burgundy, or Franche Comté, is bounded on the north by Lorrain; on the east by the earldom of Mumpelgard and Swisserland; and on the south and west by the government of Burgundy and Champagne. Its extent from south to north is about ninety miles, and from the south-east to the north-west sixty. Almost one-half of it is a level country abounding in corn, wine, pastures, hemp, &c. and the other half is mountainous, but produces a good breed of cattle, and some corn and wine.

This country contains mines of copper, iron, lead, and silver. Near the village of Touillon is a spring that runs and ceases at stated times, and the town of Salines has profitable salt-springs and marshes. In this district are likewise quarries of alabaster and marble; and also near the river Doux is a large grotto in which nature has formed pillars, and a surprising variety of figures; and near Leugne is a natural cavern of ice, which freezes in summer and thaws in winter.

The principal rivers of this province are the Saone, the Ougnon, the Doux, the Louve, and the Dain.

Franche Comté has a parliament of its own; it is subject to a governor, lieutenant-general, and sub-governor; and is divided into four large districts, the principal places in which are the following:

Besançon, in Latin Vesontio, and Besontium, the capital of the country, is a hundred and sixty miles to the south-east of Paris, and is the seat of an archbishopric, a parliament, an intendency, a bailiwick, a country and a mint-court, &c. It is divided by the river Doux into the Upper or Old Town, and the Lower or New Town, and is surrounded by a wall and other fortifications: it is also defended by a citadel that stands on a steep rock, and is an oblong square, flanked with four irregular bastions, the ground being too uneven to admit of regular works. Till the peace of Westphalia it was an imperial city, but at that time was transferred to Spain: it was afterwards taken by France, and its fortifications were greatly strengthened by Lewis XIV. The cathedral, which is dedicated to St. John, stands at the foot of Mount St. Stephen; and the archbishop, who styles himself a prince of the empire, has three suffragans under him, with a revenue of thirty-six thousand livres, out of which he pays a thousand and twenty-three florins to the court of Rome. The city also contains two chapters, eight parish-churches, two abbies of monks, and two of nuns, twelve convents, one university, three hospitals, and had a college of Jesuits. The town-house, the governor's palace, and that of Granville, are the most remarkable buildings in the place; the last of which is furnished with a great variety of excellent statues and pictures, and a library containing a great number of valuable books and manuscripts. In the neighbourhood of Besançon are the ruins of an amphitheatre, a hundred and twenty feet in diameter, and of some pagan temples, with a triumphal arch dedicated to the emperor Aurelian.

Salines, in Latin Salinæ, so called from an excellent salt-spring which yields the crown a great revenue, is pleasantly situated on a rivulet in a valley between two mountains, twenty miles to the south of Besançon, and two hundred to the south-east of Paris. It is a long town, chiefly consisting of one street, and has four chapters, four parish-churches, ten convents, one college, and one hospital. The hall, in which they have their

magazine of salt, and where their courts of justice are held, is a magnificent building. The town is defended by a wall, and near it stands Fort Belin, which is seated on a hill, and on another is Fort Brecon, and a castle. It contains five or six thousand inhabitants, and in its neighbourhood are quarries of jasper, beautiful alabaster, and black marble.

Dole, a town seated on the river Doux, eighteen miles to the south-west of Besançon, in a district of the same name, which, from its beauty and fertility, is styled Val d'Amours, or the Vale of Love, was formerly, while Besançon continued a free imperial city, the capital of the country, the seat of a parliament, of a chamber of accounts, and of an university. On its being taken by Lewis XIV. in 1668, he caused the fortifications to be demolished; it was afterwards taken by the Spaniards, who fortified it again; but the French retaking it in 1674, it was a second time dismantled, and the parliament and university afterwards removed to Besançon; but the chamber of accounts still remains here. It is still a pretty town, the streets are spacious, and the houses tolerably well built. The publick edifices most worthy of notice are the church of Our Lady, the Jesuits college, and the palace where their parliament was held. It has also one chapter, eleven convents of both sexes, and an hospital. The inhabitants are said to amount to between four and five thousand. Here are still the remains of several Roman antiquities, particularly of two aqueducts.

Gray, in Latin Gradicum, is a pretty trading town seated on the Saone, about ten miles to the north-west of Besançon, and was well fortified, till taken by Lewis XIV. in 1668, who demolished the works. It contains but one parish-church, a collegiate church, five convents, and had a college of Jesuits. The inhabitants are computed to amount to about four thousand. Here they embark great quantities of corn, iron, and other merchandize, which they transport to Lyons.

SECT. VII.

The Situation, Extent, Produce, and Mountains of Alsace. The Inundations of the Rhine; with the Gold Dust and beautiful Pebbles found in that River. Of the other Rivers of Alsace. The Number of its Inhabitants; the Manner in which that Country became subject to France; with a Description of Strasburg, and the other principal Cities of Alsace.

ALSACE terminates to the southward on Swisserland and the Franche Comté, to the eastward on Ortenau and Brisgau, to the northward on the Palatinate, and to the westward on Lorrain, extending from north to south about eighty-five miles. The country in general is very pleasant, and abounds in all kinds of grain, fruit, esculent vegetables, flax, tobacco, and wood: its wine is very palatable, and its pastures are also rich. The country between the rivers Ill, the Haardt, and the Rhine, is narrow and but indifferently fertile; but has some vineyards and a few pastures: here rye, barley, and oats, are the only grain; but that part which lies between the mountains, the Ill, and the plain of Soultz, in Upper Alsace, to the distance of six miles beyond Hagenau, yields an exuberance of grain, wine, and pastures. The mountains abound in wood, and, though they produce but little corn, they feed large herds of cattle. The country from Mount Saverne, and the levels about Strasburg to the Rhine, is incomparably fertile and delightful, it being rich in all kinds of grain, tobacco, culinary vegetables, saffron, and hemp.

The chief chain of mountains in this country is the Wasgau, in French the Vosge. This chain begins in the neighbourhood of Langres, and extending at first from west to east separates the country of Burgundy from Lorrain. After this, winding towards the north, it separates Lorrain from Alsace, and forms another curve towards the electorate of Triers. The summits and valleys of this chain, as well as the plains of Alsace, according to Busching, produce a hundred and fifty kinds of trees and shrubs, and fifteen hundred and fifty species of herbs, which all grow wild. This chain has also some excellent pastures, and the eminences, where the soil is favoured

with a sunny exposure, produce very agreeable red and white wine, of which a great deal of brandy, vinegar, and tartar is made. This chain of mountains has also for these several centuries been famous for its mines of silver, copper, and lead; several parts also abound in iron, antimony, cobalt, sulphur, and other minerals. It is also observable, that these mountains are thick set with an uncommon number of churches, convents, and chapels.

The Rhine, which serves as a security to this country, frequently causes terrible devastations, not only in winter, but in the midst of summer, when the snow melts on the Alps. Its inundations then ruin the fields, by covering them with sand. The violent torrents of the Rhine, which generally happen every year, frequently alter the situation of the islands within it. One singularity of this river is, that in its sand are found particles of gold, which the torrents in their fall wash from the Alps, and bring into the Rhine. Accordingly it is only below Basil that the sand contains this precious mixture, which in autumn and winter, when the river is at the lowest, is drawn out with the sand, and, after passing through several waters, the gold is extracted. The particles of this metal are seldom so large as a grain of millet; the gold is indeed very fine and beautiful; but is so scarce, that the city of Strasburg, which has the privilege of gathering gold for the length of four thousand paces, scarce collects five ounces in a year. The Rhine also contains many crystals, and particularly pebbles that receive a beautiful polish, and are much used in France under the name of Rhine pebbles.

The following rivers issue from the above chain, and run into the Lower Alsace, the Leber, the Cher, the Andlau, the Ergers, and the Breusch; these three last run into the Ill. The Serr, the Motter, the Seltzbach, the Lauter, and the Queich, which run into the Rhine. In Upper Alsace the Berre and the Ill, which also run into the Rhine.

The number of inhabitants in Alsace is computed at about half a million. In Upper Alsace and Sundgau are thirty-two large and small towns, in Lower Alsace thirty-nine, and in both are upwards of a thousand small towns and villages. The common language of the inhabitants is the German, and they are partly Lutherans and partly Roman catholics.

Alsace has been subject to several German families, and particularly to the house of Austria; but at the peace of Munster the emperor ceded to the crown of France all right to the town of Brisac, the landgravate of Upper and Lower Alsace, Sundgau, and the district of the ten united imperial cities in Alsace, with the whole sovereignty belonging to them. On the other hand, France engaged that the inhabitants should continue unmolested in the enjoyment of their freedom; and promised to be satisfied with the power which the house of Austria had enjoyed over them, and had transferred to France by that treaty. In the succeeding wars France took the ten imperial cities in Alsace, and as by the peace of Nimeguen no express stipulation was made for their restitution, the king treated them as a part of his acquisitions, and directed a chamber of appeals at Brisac, to which not only those cities, but the nobility of the empire, and all others holding imperial lands in Alsace, were to bring their processes, and not to the imperial chamber of the empire. At the peace of Ryswic, in 1697, the emperor and the empire ceded to France the perpetual sovereignty of the city of Strasburg, and of all its dependencies on the left side of the Rhine.

The principal place in Upper Alsace is Strasburg, in Latin Argentoratum, the capital of the whole country. It is a royal, free, imperial city, and the seat of a mint-court. It stands in forty-eight degrees thirty-six minutes north latitude, and in seven degrees forty-one minutes east longitude, near two miles distant from the Rhine, and is surrounded by the rivers Ill and Breusch, which also run through it; besides which an arm of the Rhine is conveyed to the city. It is not very well fortified, but by means of a sluice in the city may be laid under water. The ramparts are extremely pleasant and planted round with trees, and towards the Rhine it has a regular citadel.

The city is large and populous, it containing about thirty-two thousand houses, four thousand three hundred families, and thirty thousand inhabitants. The streets are in general narrow, two only excepted, and are adorned with few handsome houses. The public buildings are the town-house, the episcopal palace, that of the intendant, the arsenal, and the play-house. In the city hospital is kept corn of a great age, and they are said to have wine that is some hundred years old. The French hospital is a fine building, it being erected by Lewis XIV. for the reception of his soldiers.

The cathedral is a very antient structure, it being finished in the year 1449, and consequently the Protestants are not chargeable with the satirical sculptures which a few years ago were to be seen on the cornices and pedestals, representing monkies, asses, hogs, and other animals, in monkish habits; and among the rest a monk in an indecent posture with a nun. It is supposed that these were done by order of the secular clergy, to be revenged on the monks for the ill offices they were always doing them. The steeple of the cathedral is justly reckoned one of the highest in Europe, it being five hundred and seventy-four feet in height. The clock of this structure has been greatly admired; for it not only shews the hours of the day, but the motion of the sun, moon, and stars: among other things there is an angel which turns an hour-glass every hour, and the twelve apostles proclaim noon by each of them striking a blow with a hammer on a bell: there is likewise a cock which steps out and crows every hour. Among the curiosities within this church are the furniture and ornaments which Lewis XIV. presented to it, and are extremely rich and magnificent; fifty persons it is said were employed on them during eleven years, and they cost that prince six hundred thousand dollars; the principal of these is a splendid altar-cloth. There are here also a triple set of missal vestments and altar furniture, six large silver chandeliers, each so heavy that it requires a strong man to carry it, and a crucifix of double the weight. These seven pieces of plate put together weigh a thousand and sixty-six pounds eight ounces.

There are here also three collegiate churches, two of which are parochial; together with four others belonging to the Romish community; but the Lutherans are in possession of St. Thomas's church, in which the illustrious count Maurice of Saxony was interred in the year 1751; yet the Protestants perform their public worship at Wolfenheim, and not in the city. The university and gymnasium here are Lutherans; and here are also an anatomical theatre, a physic garden, a royal society founded in 1752, and particularly instituted for the natural history of Alsace: there are also six convents, and till lately a college of Jesuits.

The city council is half Lutheran and half Roman catholics; but most of the burghers are Lutherans: the college of magistrates consists of three chambers; to the first belong thirteen persons, who preside over matters of justice; the second is composed of fifteen persons, under whose care are the rights and privileges of the city, the hospitals, police, and finances; the other chamber is composed of twenty-one, in whom is lodged the ordinary government of the city. Over these is the grand council, which consists of thirty members, ten of whom are noblemen, and twenty burghers. It has also an inferior council, for the determination of affairs of less importance. The supreme magistrate here, since the city has become subject to France, is the royal prætor, who takes care of the king's rights, and that nothing be done in the college of magistrates, contrary to his majesty's pleasure. The inhabitants, however, pay nothing to the king; but all the imposts levied here are expended in the support of the city.

To this city belong five districts, or lordships. The bishopric of Strasburg also comprehends a considerable tract of territory, subject to the bishop, as a temporal lord. It lies scattered in Upper and Lower Alsace, and on the other side of the Rhine, where he has two districts. He styles himself prince of the empire, and landgrave of Alsace; and though at present subject to France, yet, by virtue of the districts on the other side of the Rhine,

Rhine, is actually a state of the empire, and has a seat and voice in the diet: he has also many vassals under him, and among them almost all the nobility in Lower Alsace, together with a great part of those in the Upper. His revenue is said to amount annually to two hundred and fifty thousand livres, and it was formerly much more considerable. As a bishop he is subordinate to the archbishop of Mentz.

Fort Louis is a very strong and handsome fortification, upon an island in the Rhine, twenty miles to the north-east of Strasbourg. It was erected in the year 1686, and consists of a spacious and regular quadrangle, with four large bastions, and the same number of half-moons. Near it is a small town, formed of straight streets, and the whole island is fortified round.

Zabern, a small town seated on the river Sor, fifteen miles to the north-west of Strasbourg. It was the usual residence of the bishop of Strasbourg, till this place embraced the Lutheran religion; and his palace and gardens here are delightful. Here is a collegiate church, one hospital, and two convents; but what is particularly remarkable, is the beaten broad road, carried, behind the city, to the top of a high mountain, the ascent to which is rendered so easy by such a number of windings, that a person may either ascend or descend without the least difficulty.

Colmar, the capital of Upper Alsace, is situated near the river Ill, thirty-five miles south by-west of Strasbourg, and had strong walls, which Lewis XIV. caused to be demolished in the year 1673; but after the treaty of Ryswic he encompassed it with new walls. The inhabitants are said to enjoy all their privileges, and, tho' most of them are Lutherans, have liberty of conscience. It contains about eight hundred houses, and seven thousand one hundred and forty inhabitants.

SECT. VIII.

Of the Dutchies of Lorrain and Bar; their Situation, Extent, Produce, and Rivers; the Manners and Language of the Inhabitants. The Manner in which they became subject to the present Duke of Lorrain; his Titles, and a Description of the principal Cities in those Dutchies.

THE dutchy of Lorrain derives its name from Lotharius II. grandson to the emperor Lewis I. and was formerly of much greater extent. It is at present bounded on the east by the Lower Palatinate and Alsace, from the latter of which it is separated by the Vogean mountains, on the south by Franche Comté, on the west by Champagne, and on the north by Metz. Its greatest breadth from north to south is about a hundred miles, and it is nearly as much from east to west.

It enjoys a very temperate climate, and has a fruitful soil, which particularly abounds in grain, though it has many woods and mountains; but in these are good game, and also excellent pasture. The country has also salt springs, with some mines of iron, copper, tin, and silver. In the mountains of Wasgau are found agates, chalcedonies, and other gems. Its lakes too abound in fish, particularly the lake of Lindre, the profits of which are said to amount to sixteen thousand livres per annum.

The principal rivers in this dutchy are the Maese, the Mosel, and the Saar. Here are also the small rivers of Voloy, Mortaire, and Meurte.

The inhabitants have always been reputed brave soldiers, and their modern dukes have constantly kept on foot a particular army, which have performed signal service. But the French have frequently had the policy to turn the power of Lorrain to their own advantage, and to the prejudice of the duke. The Lorrainers are also laborious; but have little trade with strangers, they having no navigable rivers, and all necessaries within themselves; but what little trade they have consists of corn and linen.

The language spoken here is French, except in the German districts, where that language is spoken. The Romish religion prevails all over the country.

Lotharius, the younger son of the emperor of the same

name, may be considered as the first founder of the state of Lorrain, its name being derived from him. The country, after his decease, was divided among his relations, and was afterwards sometimes possessed by the Germans, and sometimes by the French, and continual disputes arose between the emperors of Germany and the kings of France. At length, in 1733, France took possession of this dutchy; and in the preliminaries of peace in 1735 it was concluded, that not only the dutchy of Bar, but likewise that of Lorrain, the earldom of Falkenstein excepted, should be ceded to Stanislaus, king of Poland, and father-in-law to Lewis XV. and after his decease both duchies, together with the absolute sovereignty of them, should for ever belong to the crown of France. On the other hand, the emperor Charles VI. engaged in return to cede the great dutchy of Tuscany to his son-in-law Francis Stephen, the late emperor, to atone for his losing Lorrain. This was settled in 1736, and the following year Stanislaus took actual possession of the dutchies of Lorrain and Bar, and the duke of Lorrain became possessed of Tuscany.

The dukes of Lorrain bear the following titles: S. by the grace of God duke of Lorrain and Mercœur; king of Jerusalem and Marchis; duke of Calabria, Bar, and Guelders; margrave of Pont à Mousson and Nomeny; and count of Provence, Vaudemont, Blamont, Zutphen, Saarwerden, and Salem. From hence may be seen not only the countries the duke actually possesses, but likewise their pretensions. The eldest son, during the life-time of his father, is styled count of Vaudemont, and also writes himself, while unmarried, margrave of Pont à Mousson; but after his marriage he assumes the title of duke of Bar. The antient house of Lorrain, by virtue of a treaty concluded in 1736, retains all the titles, arms, and privileges, with the rank and quality of sovereign princes, which it formerly enjoyed, yet without any claim to the ceded countries.

The principal places in the dutchy of Lorrain are the following:

Nancy, the capital of the dutchy, and the antient residence of the dukes, is seated in a delightful plain near the river Meurte, seventy-five miles to the west of Strasbourg, and is divided into the Old and New Town. The former is both the smallest, and makes the meanest appearance, it being built with narrow streets; but in it stands the palace, which was begun by duke Leopold Joseph; yet only the main body is finished. The spacious long square, or wide street before it, has a fine appearance. In the palace are eighteen very exquisite pieces of tapestry, representing the achievements of Charles IV. duke of Lorrain. Here are also shewn the sabres of two Burgundians, who were killed with Charles the Bold; and likewise that duke's helmet, lined with red velvet, and a yellow crest on the top. This helmet used to be carried every year in procession by the captain of the Swifs, while two other Swifs carried the sabres. Near the palace is a beautiful garden upon one of the bastions, from which there is a very fine prospect. Adjacent to this garden stands the opera-house, which was built by Bibiena, an Italian architect, who also built the theatre at Vienna. This house is not remarkable for its largeness, but is extremely well contrived, and on each side of it is a good tribuna, which is a great ornament to it.

The New Town is larger, and contains broad and straight streets, with several beautiful houses; but, according to the fashion of this country, they are generally low. In this city are three parish and three collegiate churches, with two abbies, seventeen convents, one college, one hospital, an academy of sciences, and one commandery of the knights of Malta. Among the collegiate churches is the new stately cathedral, which is immediately subject to the pope. This is a magnificent building, it being adorned with two towers and a cupola after the Italian taste. The chapter consists of a primate and sixteen canons. The duke nominates the primate without consulting the canons. In the collegiate church of St. George stands not only the monument of Charles the Bold, duke of Burgundy, who was slain in 1476, but also the tombs of the antient dukes of Lorrain. The latter dukes are interred in the church of the Capuchins. The city was formerly

formerly fortified, but by the peace of Ryswic was dismantled, only the works of the Old Town still remaining.

Luneville, in Latin Lunaris Villa, a small, very ancient, and once fortified town on the river Vesouze, stands in a low marshy country, twelve miles to the south-east of Nancy. It is at present the capital of a provostship, and has a fine palace, in which not only the two last dukes of Lorraine chiefly resided, but was the residence of king Stanislaus, till in the year 1755, when the right wing of the palace was entirely burnt down. In this town is also an abbey, with a commandery of the knights of Malta, and three convents. The gymnastic academy in this place is altered to a foundation for cadets, one-half Lorrainers, and the other Poles.

It is remarkable that at a few miles distance from Luneville is Beaupré, an abbey of Protestant Benedictines, but they follow the Cistercian rule of St. Benedict. It is seated in a delightful country, and has an abbot, nine priests, nineteen religious and twenty-three lay-brothers, with a yearly revenue of eighty thousand Lorraine livres.

The duchy of Bar, or Barrois, was antiently an earldom, so called from the castle of Bar, erected in the year 964 by Frederic I. whom the emperor Otho created earl of Bar. The principal place in this district is

Bar le Duc, the capital of the country, seated on a rising ground on the banks of the river Ornain, about forty miles to the west of Nancy, and is a handsome well-built city, with two chapters, one parish-church, one priory, seven convents, and an hospital. Here also is a ducal palace.

S E C T. IX.

Of the Messin, or Government of Metz, and the Counties of Verdun and Toul: their Situation, Produce, Rivers, and principal Cities.

THE government of Metz consists of the countries of Messin, French Barrois La Saare, and French Luxemburg. Its principal rivers are the Maese; the Moselle; which rises in one of the Wasgau mountains, and is constantly navigable from Metz, discharging itself into the Rhine; the Meurte, which also rises in the Wasgau chain, and runs into the Moselle; the Orney, or Ornain; the Saare, which runs into the Moselle; and the Saon, which falls into the Rhone.

The Messin, or the country round the city of Metz, is but indifferently fertile, and produces little wheat. It was antiently a part of the kingdom of Austrasia, of which Metz was for a long time the capital, and the usual residence of the king. When the children of Charles the Great and Lewis the Pious divided the dominions of that crown, the kingdom of Lorraine rose out of the remains of that of Austrasia; and towards the end of the second royal line of France, Metz, Toul, and Verdun, three principal cities, shook off the yoke, and, to secure their freedom, put themselves under the protection of the emperor. The power was divided between the bishop and the magistrates; but the latter, by the assistance of the people, obtaining the superiority over the former, the bishop had no other power in the city of Metz and the country of Messin than a share in the election of the magistrates, and in the administration of the oath of office. The magistrates enjoyed an unlimited authority in the city and in the country of Messin, and the bishop in the domains of his bishopric on this side the Vis; though in certain cases appeals lay to the imperial chamber, which they acknowledged as the supreme power of the empire. In 1552 Metz, Verdun, and Toul, put themselves under the protection of France, which kept possession of these three cities under the name of the protected district, till the year 1648, when, at the peace of Westphalia, the three bishopricks were absolutely transferred to France.

Metz, in Latin Metæ and Metis, the capital of the country, lies between the Moselle and Seille, which here unite their streams, and is situated twenty-eight miles to the north of Nancy. The Old Town is large, but the streets are narrow; and though the houses are built in the old taste, they are handsome structures. The New Town is likewise large, and much more beautiful than the former. Besides the cathedral, this city contains three

chapters, sixteen parish churches, six abbeys, and as there are here many Jews they have a synagogue. There is here a parliament, an intendency, a chamber of accounts and imposts, a mint, a country and forest court, besides other public offices. Among its fortifications are three citadels. The bishop, who styles himself a prince of the Roman empire, is suffragan to the archbishop of Treves, and has a diocese of six hundred and thirteen parishes, with a revenue of a hundred and twenty thousand livres, out of which he annually pays to the court of Rome six thousand florins.

The bishopric of Metz and its district must be distinguished from the Messin, and is a long but irregular tract of land, the lord of which is the bishop; but he has been deprived of his temporal jurisdiction, which chiefly belongs to the duke of Lorraine, particularly the salt-works, in lieu of which the bishop receives thirty thousand livres, and four hundred bushels of salt, which the duke, or at present the French king, causes to be annually delivered into the bishop's magazine.

Sare-Louis is a new town and fortification begun by Lewis XIV. on the river Sare in 1688, and finished about four or five years after. It is situated about thirty-two miles to the north-east of Metz. Its streets are regular, and the fortifications form a regular hexagon. It is the seat of the county court, and contains one parish-church, with two convents. This town, with a district belonging to it, has been ceded by the duke of Lorraine to France.

The country of Verdun extends along the Maese; has many large towns and villages; but has only one city, which is that of Verdun.

The city of Verdun, in Latin Verodunum, or Veredunum, the capital of the country, is situated about thirty-eight miles to the north-west of Nancy; it is the see of a bishop, and has a provincial and a manor court. It consists of three parts, namely, the Upper, Lower, and New Town; and, besides its other fortifications, is defended by a fine citadel. The bishop, before the city and district were annexed to the crown of France, was a prince of the empire, and still styles himself such, as also count of Verdun. The archbishop of Treves is his metropolitan. His diocese consists of a hundred and ninety-two parishes, his revenue is fifty thousand livres, and he pays to the court of Rome four thousand four hundred and sixty-six florins. Besides the cathedral, there are in this city one collegiate and nine parish-churches, six abbeys, and a college of Jesuits. It was formerly an imperial city, but in the year 1552 the inhabitants put themselves under the protection of France, and in 1648 they fell absolutely under the power of the French king.

The earldom of Toulais being small, is hemmed in by Lorraine; and, together with the city of Toul, and the other bishoprics of Metz and Verdun, put itself in 1552 under the protection of France, which in 1648 obtained the absolute sovereignty over them.

Toul, in Latin Tullum, the principal city in this earldom, and the see of a bishop, is seated on the Moselle, over which is a fine stone bridge, with a regular fortification. This town, which stands ten miles to the west of Nancy, has a provincial and district court, and was formerly an imperial city. Its bishop was a prince of the empire, which title, together with that of earl of Toulais, he still assumes: he is suffragan to the archbishop of Treves, and his diocese contains fourteen hundred parishes; yet his revenue is little more than seventeen thousand livres, and he pays at the court of Rome two thousand five hundred florins. In this city is a fine cathedral, one collegiate and four parish-churches, three abbeys, two priories, seven convents, two hospitals, one commandery of the knights of Malta, and one seminary.

S E C T. X.

Of French Flanders; its Situation, Produce, and principal Places; with a particular Description of Gravelines, L'Isle, Douay, Cambray, and Dunkirk.

WE have already given a description of Flanders in general in page 277, where we have described that part belonging to the house of Austria, and with this we have

have concluded our account of Germany, that country making a part of the circle of Burgundy. We have given Dutch Flanders under the section which treats of the Generalité Lands, in page 297, under which name the Dutch include that country; and we shall now give a description of French Flanders, which is properly inserted here, as it constitutes a part of France, and is in no respect a separate country.

French Flanders contains a part of the antient earldom of Flanders, the Cambresis, the country of Hainault, and a small part of the earldom of Namur. This country is bounded on the north by the Seine and the German ocean, on the east by the Austrian Netherlands, on the south by Artois, and on the west by the German ocean.

French Flanders being a part of the earldom of Flanders which Lewis XIV. over-run in 1667, it thence obtained its name. It abounds in corn and vegetables of all kinds, as also in flax. Its pastures are excellent, and consequently produce fine cattle; but for want of wood, or coal, the inhabitants are obliged to make use of turf for their fuel.

The principal places in French Flanders are the following:

Gravelines, or Gravelingen, a small but strong town seated near the mouth of the Aa, on the English channel, fifteen miles to the south-west of Dunkirk, and, besides its other fortifications, is defended on the land-side by a good citadel, and to the sea by a fort. It was taken and burnt by the English in the year 1383, but afterwards rebuilt to better advantage, and walled round. In 1528 it was fortified by the emperor Charles V. but its works have been since considerably improved by marshal de Vauban, so that it is now a pretty strong place. In 1644 it was taken by the French, and in 1652 by the archduke Leopold. In 1658 it was again taken by the French, and was at last yielded to them by the treaty of the Pyrenees; but in 1694 was entirely laid in ashes.

L'Isle, Lille, or Ryssel, the capital of French Flanders, and of all the French conquests in the Netherlands, is situated on the Deule, thirty-seven miles to the south-east of Dunkirk. It is beautifully built, and is large, handsome, and populous; it is the residence of the governor-general; and has an intendency, a mint, a chancellery, a bailliwick, and forest court. It has a collegiate church, and about thirty other churches, seven of which are parochial, a great number of convents, and a noble hospital called *L'hôpital Comtesse*. Several of the buildings are very fine, particularly the exchange, which is a square structure, surrounded with piazzas.

This city is strongly fortified, which the English and their allies experienced in the reign of queen Anne, when prince Eugene, after the battle of Oudenarde, having sat down before it in 1708 for near three months, took it at last, though with the loss of a great number of men; but it was restored to the French by the treaty of Utrecht in 1713.

Both the antient and new fortifications are very numerous and considerable, they having been greatly improved by marshal de Vauban. The citadel, which was the first built by that great engineer, is a pentagon, composed of five regular bastions, defended by several works, and surrounded with a deep ditch, a covert-way, and glacis. To this fortress are two gates, one towards the city, and the other towards the country. The esplanade, or space between the city and citadel, is planted with four rows of trees, which form very pleasant walks. The general governor of French Flanders is also governor of this city, in whose absence his place is supplied by the king's lieutenant. The citadel has also a governor, and a lieutenant of the king.

The governor presides at the meeting of the states, which is commonly held about the close of the year. The other members of this assembly are the magistrates of L'Isle, who have always the first rank, the lords who have sovereign jurisdiction, and the deputies from Douay and Orchis. The sum demanded by the king from the states generally amounts to two hundred and fifty thousand livres, which is always granted and raised from the twentieth part of the revenue of estates, and from duties on taxes. Besides which the city of L'Isle annually pays

thirty-seven thousand five hundred livres toward the repairs of the fortifications. The clergy and nobility pay no subsidy, and do not assist at the meeting of the states; but three or four days after they break up, these are called together by the governor, &c. and a sum demanded in the king's name; and then these two bodies commonly grant a twentieth part and a half of the income of their estates. The body of the magistracy of L'Isle and its district is composed of a mayor, styled *revart*, and twelve echevins, all of whom are annually changed. There are here considerable manufactures of silk, cambric, fine linen, and other stuffs; and their camblets are highly esteemed. The trade of L'Isle through France by land-carriage, or by way of Dunkirk, is pretty considerable. The most profitable commerce is that to Spain and the West Indies, either on their own account or by commission.

Douay, a pretty large and well fortified city, lies on the river Scarpe, twelve miles to the east of Arras, and is of an oval form, larger than L'Isle, but less populous by one-third. It is defended by Fort Scarpe, which stands about a mile below the city, and the whole country may be laid under water by means of sluices. Here is an university founded in the year 1559, one collegiate church, and seven that are parochial, with a famous English seminary.

The principal trade of this city consists in the making and selling of worsted camblets, which are bought up by all the neighbouring people, especially at the annual fair kept here in September. The magistracy consists of twelve echevins, the first of whom is styled the chief. In 1710 the confederates made themselves masters of the city; but lost it again in the year 1712.

The Cambresis is about ten leagues in length, and from five to six broad, though in some places not above two or three. It is fruitful and populous.

Cambray, in Latin *Cameracum*, and *Camaracum*, the capital of the Cambresis, is situated on the Scheld, fifteen miles to the south-east of Douay, and is a pretty large well fortified city, defended by a citadel and fort. It is the see of an archbishop, and, besides its cathedral, contains two chapters, ten parish-churches, two abbeys, and two hospitals. The archbishop styles himself prince of the holy Roman empire, as indeed he formerly was, and count of Cambresis. He is, however, lord of the city. His diocese consists of eight hundred parishes, and his revenue is a hundred thousand livres, out of which he is annually obliged to pay six thousand florins to the court of Rome. This city is famous for its cambric, which took its name from it. It has been subject to France ever since the year 1667.

Chateau-Cambresis, the capital of the earldom of Cambresis, lies thirteen miles to the south-east of Cambray, and was once fortified; but at present lies open, and contains one abbey. The archbishop, who has here a very magnificent palace, and fine gardens, is lord of this palace.

In the year 1559 the famous treaty of this name was concluded here, between Henry II. king of France, and Philip II. king of Spain, by which the French gave up a hundred and ninety-eight towns for St. Quintin.

French Hainault is a part of the earldom of Henegau, and its principal city is the following:

Valenciennes, a large and populous city, seventeen miles to the north-east of Cambray, is seated on the river Scheld, which not only divides it into two parts, but almost runs round it. The fortifications are after the manner of Vauban; it has a good citadel on the Scheld, and very fine sluices. That part on the right of that river belongs to the diocese of Cambray, and has one collegiate church, and one abbey; the other side belongs to the diocese of Arras. The inhabitants have manufactures of woollen stuffs, and very fine linen. This city was taken by the French in 1677.

The government of Dunkirk contains only the town of the same name, and some neighbouring villages. At the peace of Utrecht, and all the other treaties that have been concluded since, it was agreed, that the fortifications and harbour should be demolished.

Dunkirk, called by the French *Dunquerque*, is seated on the Colne, which here falls into the British channel, in

in the fifty-first degree two minutes north latitude, and in the second degree twenty-seven minutes east longitude, twenty-six miles to the east of Calais. It derives its name from a church built there on the Duns, or sand-banks, erected, as it is said, by St. Eloi, who first preached Christianity among the Flemings. Some houses were gradually built near it, so as to form a little town, which Baldwin, earl of Flanders, in the tenth century, encompassed with a wall; and it enjoying a harbour commodious for trade, the inhabitants engaged in commerce, by which it grew large and wealthy, and had even some ships of war; so that in the twelfth century the inhabitants fitted out a small fleet against the Norman pirates, and performed such eminent services, that Philip, earl of Flanders, conferred some considerable privileges on the town. In the thirteenth century it was sold to the bishop of Cambray, who enlarged the town and improved the harbour. It was afterwards in the possession of several different families, and in 1538 the emperor Charles V. erected a castle here; but in 1551 it was taken and destroyed by the French. It was afterwards possessed by Spain; and, though the town recovered itself again, the inhabitants had a great share in the disturbances which arose in the Netherlands. In 1646 and 1658 it was taken by the French, and in the last-mentioned year ceded to the English for assisting France against Spain. In 1662 Charles II. king of England, sold the town to France for five millions of livres, by which means Lewis XIV. acquired also Mardyke, and the other villages which the English had built round Dunkirk.

Lewis upon this ordered the city to be well fortified, erected a fine citadel, and built Fort Lewis, which stands to the south on the canal of Bergen, about a mile and a half from the town. The harbour was also put into a most excellent condition, two moles of piles forming a canal in the sea, a thousand fathoms in length, and about forty in breadth, and at each end of the moles were erected two batteries. Besides these, on each side of the dyke was a fort, together with the battery of Revers; the castle of Gaillard on the east, and a little farther Fort Blanc. Between all these forts ships were to pass in their way to the harbour, contiguous to which was also a large basin.

This city enjoyed a flourishing trade, and in 1706 contained sixteen hundred and thirty-nine houses, in which were fourteen thousand two hundred and seventy-four inhabitants. The English, for the security of their commerce, which had suffered immense damage from the privateers of Dunkirk, compelled France to promise at the peace of Utrecht to destroy the fortifications, to fill up the harbour, to demolish the dams and sluices, and never to repair them. This was actually begun; but it was found, or at least pretended, that by filling up the harbour, the country round, for about ten French leagues, would be in danger of being overflowed. To remedy this inconvenience several fruitless negotiations passed between France and England, and in the mean while a new canal was made at Mardyke. By the treaty concluded at the Hague between France, England, and Holland, in 1717, it was agreed, that the large entrance of the new sluice at Mardyke, which was forty-four feet broad, should be entirely demolished; and that no harbour, sluice, or basin, should ever be made either at Dunkirk or Mardyke, or within two French leagues round; and that the demolition of the works of Dunkirk should be entirely completed: but France making no great haste in this work, it was in 1748 made an article of the peace at Aix la Chapelle. After which France, instead of fulfilling these engagements, began some new works, which gave fresh umbrage to the court of England, who received certain intelligence that the city was again fortified on the land-side, the basin widened, and rendered as commodious for the reception of ships as ever the harbour had been. The French court replied, that these works had no other view than to free the inhabitants from the exhalations of the stagnating water, a pretence as false as it was ridiculous, since the French made the greatest advantage of this place during the late war; but at the conclusion of it, again agreed to demolish the works, and fill up the bar, which is the more necessary to be insisted upon, as the French have no other harbour in the

Channel, but that of St. Malo's, which is only capable of receiving ships of between thirty and forty guns.

Mardyke is a village about four miles to the east of Dunkirk, and was formerly considerable only on account of its fort, built on the sea shore, which has often been besieged and taken, and was at last demolished. Mardyke at length became celebrated for its noble canal, which Lewis XIV. caused to be formed under the direction of Le Blanc, it being three thousand three hundred and thirty-eight fathoms and two feet in length. It began at the canal of Bergen, near Dunkirk, and extending itself, with the breadth of between twenty-five and thirty fathoms, no less than fifteen hundred from east to west in length; it then winded from south to north, and three hundred fathoms farther had an incomparable sluice with two basins, one of which was forty-four feet broad, it being contrived for the reception of large vessels; the other twenty-six feet in breadth, and intended for those that were small. By all the above treaties since that of Utrecht, the French have agreed to destroy this canal, and other works.

SECT. XI.

Of the County of Artois; its Situation, Extent, Produce, Government, and principal Cities.

THE county of Artois, which forms a part of the Netherlands, is bounded on the north by Flanders, on the east by Hainault, and on the south and west by Picardy. It is twenty-six French leagues in length, and about half as much in breadth. This is one of the best and finest provinces in the whole kingdom, and, besides its great fertility, carries on a considerable trade in flax, hops, wool, oil of turnip-seed, and has several manufactures of linen.

Its principal rivers are the Scarpe, the Aa, and the Canche.

This country, together with Picardy, is subject to one governor-general, a lieutenant-general, and two deputy-governors, one for Arras and Bapaume, and the other for Aire and St. Omer's. Here is a provincial council, which in civil affairs is subordinate to the parliament of Paris. The raising of the royal revenues is here administered by consent of the states, which consist of the clergy, a great number of abbots, and the deputies from every chapter: besides these there are the nobility, who amount to about seventy persons, and the commoners, who consist of the council of Arras, and the deputies of the magistracy of the eight principal towns of the country. No customs are paid here; the free gift required is in some measure settled at four hundred thousand livres; but the charges of forage are more or less according to the number of cavalry in the country.

The principal places in the county of Artois are the following:

Arras, the *Origiacum* of Ptolemy, and the *Atrebatæ* of Cæsar, is situated in a district of the same name, and stands on the Scarpe, twelve miles to the south-west of Douay. It is a very antient and large place, divided into two parts, the one called the city, and the other the town, which is the more modern of the two; each of these is surrounded with old walls, which have round towers, built after the antient manner, and a gate, over which was an inscription in French, "That when the French shall take Arras, the mice shall eat the cats," as if that event was impossible; but the event shewed that it was not, for the French took it in 1640.

The old walls were repaired by Vauban, who added several bastions, and a great number of new works in the ditch, which is large and very deep, particularly lunettes, built after Vauban's manner, and the first works of that kind which that excellent engineer performed. The ditch is surrounded with a covert-way, and a glacis as usual, beyond which are several redoubts of a pentagonal figure, placed in the re-entering angles, and each has its particular ditch, covert-way, and glacis. The citadel is somewhat higher, towards the country; it is not very large, but is esteemed one of the strongest in the kingdom; it being an oblong pentagon, composed of five bastions

bastions, as many half-moons, four tenailles, placed in the curtains, and a fausse-braye, which cover the front on the city-side. All these works are surrounded with a ditch, into which the Scarpe runs, or at least a canal drawn from that river.

This town has handsome broad streets, and is inhabited by wealthy traders and artificers, who make sail-cloth and tapestry, especially the latter, which was invented here, and therefore that manufacture obtained the name of Arras, which is indeed very beautiful, tho' inferior to the tapestry made at Paris, Brussels, and Antwerp. The large market-place here is surrounded with fine buildings, among which is the governor's house. There are eleven parish churches, several convents, one seminary, and there was lately a college of Jesuits. The cathedral, which is dedicated to the Virgin Mary, is a fine structure, in which are preserved some famous relics. The abbey of St. Vast has a magnificent church belonging to it; and among the chapels here, is one called the chapel of the Holy Candle, in which was kept a candle, which it is pretended was given by the Blessed Virgin, to the inhabitants, to cure them of an inward heat, which burnt and consumed them. The bishop is suffragan to the archbishop of Cambrai, and has a diocese of four hundred parishes, with a revenue of twenty-two thousand livres a year, and is taxed at the court of Rome four thousand florins. He is lord of the city, and president in the assembly of the states.

Aire, in Latin Aeria, and Aria, a considerable fortress on the river Lys, near the confines of Flanders, and about ten miles to the south-east of St. Omer's. This is a strong and well fortified place, having, besides the walls, bastions, half-moons, horn-works, redoubts, counter-scarps, ditches, and a morass, which encompasses it on three sides. On that side which is accessible, at the distance of a cannon-shot from the city, and the river Lys, stands fort St. Francis, to which you go from the city by a regular canal. This fort is a small, but regular pentagon, composed of five bastions, encompassed by a ditch, a covert-way, and glacis. The Lys divides the city into two unequal parts, which contain a collegiate church, with several convents, and had, till lately, a college of Jesuits, with two hospitals, one of which is instituted for soldiers.

Notwithstanding the strength of this place, the French took it in 1641, and soon after it was retaken by the Spaniards. In 1676, it was again taken by the French, and was confirmed to them at the peace of Nimeguen. In November 1710, it surrendered to the allies, after a very vigorous siege, and the trenches had been open for six weeks; but by the treaty of Utrecht, it was restored again to the French.

Between Aire and St. Omer's, are the ruins of the once considerable city of Terouenne, which also stood on the river Lys. It was famous on account of its being invested by Henry VIII. king of England, in person, in the year 1503, assisted by the emperor Maximilian, who on this occasion wore a St. George's cross. At this siege the French, attempting to throw provisions into the town, were defeated by the English, with great slaughter, and from the hurry with which they fled, this was called the Battle of the Spurs, intimating that these were the principal weapons they made use of to escape in safety. A fortnight after this battle, the city was taken, but dismantled and quitted. The French afterwards repaired it, but the emperor Charles V. taking it in 1553, levelled it with the ground, since which time it has never been rebuilt.

St. Omer's, the capital of a bailiwick, is called in Latin Andomaropolis, and was formerly called Sithin. It is a considerable city, seated on the Aa, eight miles north-west of Aire, partly on an eminence, and partly on a morass, and is one of the best fortifications in the Netherlands; it being defended not only by a castle, but by large bastions, between which are half-moons, surrounded with large ditches, which are indeed too high to have any water in them; but are so deep, that it would be very difficult to mount from them to the walls of the ramparts. It is the see of a bishop, suffragan to the archbishop of Cambrai, and has a revenue of forty thousand

livres, and its taxation to the court of Rome is a thousand florins.

In this city are several fine streets, and a large square, with many handsome houses, among which is the town-house. The cathedral dedicated to St. Omer, is a noble structure, chiefly remarkable for its chapels, which are embellished with fine marble and beautiful paintings. Besides the cathedral, are six parish churches, and a very rich abbey of the order of Benedictines. On each side of the portico belonging to it stands a large square steeple of great height, where a constant watch is kept, to give notice whether there is an enemy in the neighbourhood of the city, the gates of which are never opened till it be day-light, and the watch has given notice, by a signal, that he has discovered no danger. Here are also several convents and nunneries, two hospitals for maidens, a general hospital for the sick, an orphan-house for poor boys, another for girls, and a house for twelve poor old men, in memory of the twelve apostles; besides several other foundations, particularly one for annually giving a sum of money to poor girls in marriage. Here is also an English seminary.

The city is populous and has some trade, a number of small vessels coming up here from the sea by means of the river Aa. The government of St. Omer's is under a mayor, who is annually changed, and twelve echevins, and under its jurisdiction are above an hundred villages.

To the north-east of St. Omer's are floating islands that move backwards and forwards, according to whatever motion is imparted to them. Upon these islands are seen grass always growing, and the people draw them with ropes to the shore in order to drive their cattle into them: they have also some trees growing here, but these they keep very low, for fear the wind should have too much hold of them, and drive the islands with too much violence.

S E C T. XII.

Of the Province of Picardy; its Situation, Extent, Produce, Rivers, Commerce, and principal Cities, particularly Amiens, Abbeville, Calais, and Boulogne.

PICARDY is bounded on the north by Hainault, Artois, and the Straights of Calais; on the East by Champagne; on the south by the Isle of France; and on the west by Normandy and the English Channel. This province is long and narrow, it being usually compared to a bent arm, and in this figure is nearly one hundred and fifty miles in length, but not above forty in breadth, and in many places not above twenty. It is generally a plain country, and produces wine, fruit of all kinds, plenty of corn, and great quantities of hay; but wood being scarce, most of the inhabitants burn turf; they have, however, some pit-coal, but it is not so good as that of England.

Its principal rivers are the Somme, the whole extent of which is confined to Picardy; it becomes navigable at Bray, and, after receiving several small rivers, divides into twelve channels which are afterwards united, after which it falls into the British Channel. The Oise has its source in Picardy, on the confines of Hainault, and, after receiving several rivers, becomes navigable at La Fere, and falls into the Seine at Conflans. The Canche, which falls into the British Channel below Estaples. The Lanthie, which also falls into the Channel. The Lys, which falls into the Scheld. The Aa, which is made navigable at St. Omer's, by means of sluices, and at last discharges itself into the Channel. The Scarpe, which falls into the Scheld, and the Deule, which was formerly no larger than a brook, but now by means of canals and sluices is become a considerable river.

The situation of this province on the sea, its many navigable rivers and canals, with the industry of the inhabitants, render it the seat of a flourishing trade. In it are made beautiful silk stuffs, woollen stuffs, coarse linen, lawn, and sope; it also carries on a large trade in corn and pit-coal. In the government of Calais and Boulogne, are annually bought up five or six thousand colts, which

which being afterwards turned loose in the pastures of Normandy, are sold for Norman horses. The fisheries on this coast are also very advantageous.

In Picardy are four bishoprics, two provincial courts, two governments, five courts of admiralty, four forest manors, and four lordships.

Picardy is divided into Upper, Middle, and Lower Picardy, and is again subdivided into four deputy governments, the principal places in which are the following:

Amiens, in Latin Ambianum, the capital of Picardy, and of the earldom of Amienois, is seated on the Somme, sixty-five miles to the south of Calais, and eighty to the north of Paris. It appears very delightful from the largeness of its streets, the beauty of the houses, and the extent of the squares, in two of which seven fine streets meet. On the ramparts are planted two rows of trees, which form a very agreeable walk. The river Somme enters this city in three different channels, thro' the same number of bridges; so that after watering several parts of the town, these unite again at the other end near St. Michael's bridge.

The cathedral, dedicated to the Virgin Mary, is one of the finest and best embellished in all France: the pillars, choir, chapels, tombs, and paintings, are particularly adorned; and more especially the principal entrance, which is flanked with two lofty towers, on which are placed several statues. Among other relics they pretend to have here the heart of St. John the Baptist. In this city is also a collegiate church, a chapter of St. Nicholas, fourteen parish churches, several abbeys and convents, and an academy of the Arts and Sciences, with several hospitals. The bishop is suffragan to the archbishop of Rheims, and within his diocese, besides the above cathedral, are twelve collegiate churches, twenty-six abbeys, fifty-five priories, seven hundred and fifty rectories, one hundred and three chapels of ease, and forty-eight communities. His annual revenue is thirty thousand livres, and his taxation to the court of Rome is four thousand nine hundred florins. Here is the seat of a presidial court, an independent bailiwick and provostship, an office for the finances, and a mint. In this city and the neighbouring villages, the inhabitants carry on a manufacture of ferrets, and also make a considerable quantity of black and green soap.

Abbeville, that is, the Abbot's Town, is the capital of Ponthieu, a district of Picardy, and is seated twenty miles to the north-west of Amiens, and fifty-two to the south of Calais, in a very delightful plain on the Somme, which divides itself into several branches, and parts the city into two main divisions, the one towards the Low Countries, and the other towards Normandy. It is also watered by the rivulets of Scardon, Sottins, and Corneille, or Taniere. The tide here flows up the Somme, to the height of about six feet, by which means, and its situation, it is rendered a commodious port; it being but fifteen miles from the English Channel.

Abbeville was originally no more than a farm or manor belonging to the abbey of St. Requier, from which it had its name: it afterwards became a borough, from the concourse of people who came and settled in it. It is now well fortified, and encompassed with walls, which are flanked with bastions and large deep ditches. The houses are mostly of timber, old and meanly built; it is likewise extremely dirty, and next to Amiens is the most populous town in all Picardy. It contains a collegiate church dedicated to St. Ulfranc, which is a lofty stone building, fourteen parish churches, fifteen convents, a commandery of the order of Malta, and a college. It has a provincial court, with a bailiarge, a forest court, a court of commerce, a court of admiralty, and a salt office. As it is conveniently situated for commerce, it carries on a great trade in corn, oil, hemp, flax, cordage, and soap. The woollen manufacture established here in 1665, by Mr. Roberts; a Dutchman, has succeeded so well, that at present its cloths are little inferior in fineness and goodness to those of England. In it are also made very beautiful barragons, together with mocades, a kind of carpets, dimity, plush, coarse linen, spun wool, and fire arms.

Calais, a strong sea-port town, in the fifty-first degree two minutes north latitude, and in the third degree fifteen minutes west longitude, one hundred and forty-three miles to the north of Paris, in a marshy plain, on the narrowest part of the British Channel, which is here only about seven leagues broad; here the white chalky cliffs of Dover may be seen from the coast; and between Dover and Calais, go two packet-boats twice a week. The figure of this city, including the citadel, is an oblong square, the two long sides of which are each about two hundred and twenty perches in length; and the two shortest about ninety. One of the largest sides is towards the sea, and very well fortified; the other is towards the land, defended by bastions lined with stone, and covered with half-moons and deep ditches, nine or ten perches broad, that can be filled either with salt or fresh water, as they please. The short side that lies opposite to the fort of Nieulai, may be defended by being laid under water, and the other side, called the Attack of Gravelines, is still better fortified. The whole is encompassed by a covert-way, and fort Nieulai, just mentioned, is said to be a perfect piece of fortification in its kind: it has four bastions, and from thence the whole country about Calais may be laid under water in less than twenty-four hours. The citadel has still its ancient circuit and ditches, but the chevalier de Ville has surrounded it with a new enclosure with three regular bastions; and it is so advantageously situated, that it not only commands the town and fort, but likewise all the neighbouring country. Ships enter the port by a long canal, made by order of Lewis XIV. between two moles; at the head of each is a horn-work, defended by a half-moon, and encompassed by a wall, a deep ditch, and covert-way.

This port is very happily situated, but has several inconveniencies, for no vessel can enter it without running a great risque; it being almost choaked up, and there is no road for ships to ride at anchor. The canal at Calais is, however, of great use to the inhabitants for inland navigation; for by means of this canal one may easily pass by water from Calais to St. Omer's, Gravelines, Dunkirk, Bruges, and Yypres. However, notwithstanding the convenient situation of Calais, with respect to England and Holland, it is less populous than might be expected, it being supposed to contain only five thousand inhabitants.

The streets of Calais are straight, well paved, and adorned with several houses in the modern taste. In the city is only one parish church, which is a fine building, and has a very magnificent dome, and a very beautiful altar of marble; there is another church in the suburbs of St. Peter. It has four convents, two communities for the instruction of youth, and two alms-houses.

The inhabitants carry on a good trade in wine, brandy, salt, flax, horses, and butter. They are exempt from all taxes, but the assessments for the repairs of the fortifications and canals run high. The city has a particular governor, a deputy-governor, and a mayor; and to the government of Calais belong twenty-four parishes.

Edward III. king of England, took the city after a memorable siege in the year 1347; and after the English had it in their possession about two hundred years, it was retaken by the duke of Guise in 1558. It was, however, agreed by the treaty of Chateau-Cambresis, that Calais should continue in the hands of the French during the space of eight years, after the expiration of which term it was to be restored to the English. Queen Elizabeth accordingly demanded it, but the chancellor de L'Hopital refused to restore it, under pretence that during the first religious war in France, which began three years after the above treaty of peace, the English had seized Havre de Grace, and by this means had violated the treaty, and forfeited their right to Calais, which the French kept, though the English did not keep Havre de Grace, it being retaken by the French. Albert, archduke of Austria, and governor of the Low Countries, made himself master of Calais in the year 1596; but it was restored two years after to Henry IV. of France, by virtue of the treaty of Vervins. In short, this city was bombarded by the English in the years 1694, 1695, and 1696.

Boulogne, the ancient Gesoriacum, or Gisoriacum, and since Bononia, is the capital of a district, called the Boulonois, a particular government entirely independent of the governor-general of Picardy. This city stands upon a hill, at the mouth of the little river Liane, sixteen miles to the south-west of Calais. The harbour is very incommodious, with a narrow entrance, into which merchant-ships can only enter at time of flood; and St. John's road before the city, for ships of war can come no farther, is extremely bad, no vessels being able to weather it there, unless the wind blows from some point between the north and south-east; for with all other winds the sea is extremely rough and boisterous. Here formerly stood a watch-tower, called by the French *La Tour d'Ordre*, the Tower of Orders, and by the English the Old Man, said to have been first built by Julius Cæsar, and repaired by the emperor Charlemagne; but having been neglected, it fell down, and in the room of it was erected a small fort, which serves for the defence of the harbour.

The city is divided into the Upper and Lower Town, the former of which is well fortified with a strong citadel, and in it are several public squares and beautiful fountains, together with a palace, where justice is administered. Here is also a cathedral dedicated to the Virgin Mary, more venerable for its antiquity than for any thing else; also the parochial church of St. Joseph; an abbey of St. Vilemar; besides some monasteries, a seminary for the education of such as design to take holy orders, and an hospital built at the expence of the family of Aumont. The Lower Town, which is not inhabited by so many persons of quality as the other, is larger and more considerable for its trade, it being chiefly inhabited by merchants and tradesmen, and extends along the little port at the mouth of the river. The bishop of this place is suffragan to the archbishop of Rheims, and has under his jurisdiction two hundred and seventy-seven parishes, with one hundred and forty-seven chapels of ease, and a revenue of twelve thousand livres, out of which he pays fifteen hundred florins to the court of Rome.

In the year 1478, Lewis XI. surrendered this country to the Virgin Mary, declaring that for the future he and his successors should hold it from her immediately as her vassals, paying her for homage a golden heart at their accession to the crown; in pursuance of which Lewis XIV. paid twelve thousand livres for himself and his father Lewis XIII.

Boulogne was taken by Henry VIII. king of England, in the year 1544, and afterwards restored to the French king Henry II. by a treaty of peace in 1550, in consideration of his paying three hundred thousand crowns.

[S E C T. XIII.]

The Situation, Extent, Produce, Rivers, and Government of Champagne and Brie; with a Description of the principal Cities, as Troyes, Chalons, Rheims, and Sens.

THE province of Champagne is bounded on the north by Hainault and part of the bishopric of Liege; on the east by Luxemburg and Lorrain; on the south by Burgundy; and on the west by the Isle of France and Picardy; it being one of the most considerable provinces in the whole kingdom. This province extends from the west to the south-east, or from Lagny to Bourbon, forty-six leagues in length, and from south to north, or from Ravieres to Rocrois, about fifty-four. It derives its name from the large plains in its center, but its borders are full of forests, hills, and mountains.

This country produces plenty of grain, but is particularly famous for its wine, which is exported in great quantities; and the natural commodities in which the inhabitants trade, are corn, wine, iron, wood, and cattle, with hay, woollen and silk stuffs, linen, &c.

Its principal rivers are the Meuse or Maese, which receives its source near the village of Meuse; the Seine; the Maine, which rises in Bassigny; the Aube, which has its source on the frontiers; and the Aisne or Aine.

In this country are two archbishoprics and four bishoprics. It is governed by the parliament, the chamber of accounts, and exchequer of Paris, except the territory of Sedan, which belongs to the parliament of Metz. It has ten provincial and district courts, several forest-courts, two courts of mintage, and a generalité. The military government of this province is lodged in a governor, four general-lieutenants, under whom are four hereditary sub-governors. The principal cities in this country are the following:

Troyes, the ancient Augustomana, or Augustobona, the capital of the province, is seated in Lower Champagne, on the river Seine, about seventy miles to the south-east of Paris, and is pretty large, but far from being so flourishing and populous as formerly. It has fourteen parish churches, including the cathedral, and two collegiate churches, with four abbies, ten convents, one college, one seminary, and one hospital. The cathedral, which is dedicated to St. Peter, is a very noble structure; its portico is in a fine taste, but the tower on the left-side of it has been left unfinished.

The city is surrounded with walls, but they are not kept in good repair; and formerly it had three castles, from which it is supposed to have obtained its present name; but there are now few remains of them left. The bishop of Troyes is suffragan to the archbishop of Sens; his diocese contains three hundred and seventy-two parishes, ninety-eight chapels of ease, with seventeen abbies; his yearly revenue is fourteen thousand livres, and his taxation at the court of Rome is two thousand florins. This city still carries on a tolerable trade, especially in linen, flax, hemp, and cotton stuffs, canvas, wax and tallow-candles, needles, serges, and tapestry.

Chalons, a large city seated on the Maine, in the Chalonois, a small territory, and ninety-five miles to the east of Paris. In this city is a cathedral, two chapters, eleven parish-churches, three abbies, nine convents, and there was till lately a college of Jesuits. The bishop, who is also a count and peer, is suffragan to the archbishop of Rheims, and in his diocese are comprehended three hundred and four parishes, ninety-three chapels of ease, with nineteen abbies. His yearly revenue is twenty-four thousand livres, and his taxation at Rome three thousand florins. The inhabitants carry on a considerable trade in shalloons, which took their name from this place, and in other woollen stuffs.

Rheims, the antient Durocortorum, and Civitas Remorum, the capital of a district called the Rheimois, is situated sixty-two miles to the north of Troyes, and eighty-five to the north-east of Paris, and is one of the most antient and celebrated cities in the whole kingdom. It is about four miles in circumference, and contains several fine squares, large streets, well built houses, and magnificent churches. Among these is the cathedral of Our Lady, which is a fine structure, though of Gothic architecture; the principal door is remarkable for its workmanship, and the great altar, at which the coronation of the kings of France is performed, is plated with gold. The treasury of this cathedral must be very great, as every king at his coronation makes an offering here. The book of the Gospel upon which the king takes the coronation oath, is said to be written in the Slavonic tongue, and the cover is of gold set with gems. The archbishop of this place is the first duke and peer of France, perpetual legate of the see of Rome, and primate of all Gallia Belgica. He also crowns the king; he has an annual revenue of fifty thousand livres, and his taxation at the court of Rome is four thousand seven hundred and fifty florins. Here are also three collegiate churches, five abbies, nine convents, a commandery belonging to the order of St. Anthony, a commandery of the knights of Malta, and, till the Jesuits were expelled, they had here a large seminary, and a fine college.

The abbey of Benedictines of St. Remy in this city is one of the noblest belonging to that order in all France; and on the altar of its church is kept the holy phial, which at the baptism of Clovis, in 496, by bishop Remigius, they pretend was brought from heaven by a dove, at the prayer of that saint, the crowd being so great that he was unable to get to the font with the usual oil.

oil. This phial is of a dark red glass, about the length of one's little finger, and nearly resembles in shape a small Hungary-water bottle. It has a gold stopper, and is fixed in a perforated square casket fastened on a silver salver, it being seen only through a crystal cover placed over the casket. The oil is said to be grown dry, but on every unction of a king of France a small quantity of it is taken out, and mixed with the oil prepared for the unction. The university here was founded in the years 1547 and 1549. Among the other public buildings are three spacious hospitals. The city carries on a considerable trade in wine, woollen and silk stuffs, and gingerbread. It has several remarkable remains of Roman antiquities, particularly three gates of the city, which to this day bear the names of so many pagan deities, namely, of Mars, of the Sun, and Ceres.

Sens, the Agendicum of the antients, the capital of a district called the Senonois, is seated on the Yonne, and is large but not very populous, though it is well situated for trade. This city is the see of an archbishop, whose revenue amounts to fifty thousand livres, and its taxation to the court of Rome is six thousand one hundred and sixty-six florins. The cathedral, which is dedicated to St. Stephen, is admired for its stately front, it being adorned with various figures and lofty towers; as also on account of its rich chapels, antient tombs, and the magnificence of the high altar, where is a table of gold enriched with precious stones, and on which is represented in relievo the four Evangelists, together with St. Stephen. There are here also sixteen parish-churches, five abbeys, nine convents, and there was till lately a college of Jesuits.

Several councils have been held in this city, one of the most famous of which is that in the year 1140. It contains a provincial district, and forest court, together with a salt-office.

Meaux, in Latin Meldi, the capital of a district called Brie Champenoise, is seated on the river Marne, twenty-five miles to the north-east of Paris, and contains a provincial and district court, a salt-office, &c. It has also a general-lieutenant, and a particular governor. The bishop is suffragan to the archbishop of Paris: his diocese is divided by the river Marne into two large arch-deaconries, to each of which belong three rural deanries; under both these are nine abbeys, seven chapters, and two hundred and twenty-seven parishes. The bishop's annual revenue amounts to twenty-two thousand livres, and his taxation at the court of Rome to two thousand florins. Besides the cathedral there are in this city one chapter, five abbeys, several convents, one alms-house, and one hospital.

S E C T. XIV.

Of the Government of Burgundy; its Name, Situation, Extent, Rivers, Government, and a Description of the principal Cities; particularly Dijon, Autun, and Trevoux, the Capital of the small Principality of Dombes.

BURGUNDY, called by the French Burgogne, derives its name from the Burgundians, who, towards the beginning of the fifth century, settled in Swisserland and Franche Comté, whence spreading themselves towards the rivers Soane and Rhone, they erected a kingdom of their own, which was gradually reduced by the kings of the Franks. This country is bounded on the north by Champagne, on the east by Franche Comté, on the south by Lyonnois, and on the west by the Bourbonnois and Nivernois. It extends from east to west above thirty French leagues, and from north to south above forty-five.

It is very fertile in corn and fruit, producing in particular excellent wine.

The rivers here are the Seine; the Dehune, which runs into the Soane; the Brebince, or Bourbince, which issues out of the lake of Longpendu; with the Armançon, the Ouche, and Tille, with several mineral springs.

In this government are four bishopricks. The district and provincial courts are subordinate to the parliament of

Dijon, which was erected in 1476; except the provincial courts of Maçon and Auxerre, and the district of Bar-sur-Seine, which are subject to the parliament of Paris. The states of the country, consisting of the representatives of the nobility, clergy, and commons, meet regularly every three years by writ from the king, in order to raise the sums required of them.

Dijon, in Latin Divio, the capital of the country, and government of Burgundy, is situated in the Dijonois, about a hundred and forty miles to the south-east of Paris. It is fortified after the antient manner, and defended by a castle flanked with great round towers. It is a pretty large city; the streets are well paved, broad, and straight; the houses are handsome, and the churches and squares beautiful. The neighbouring country is fruitful, pleasant, and watered by the rivers Sufon and Ouche; the first of which is but a rivulet, and, after running through the city moat, passes through the city itself, where it falls into the Dijon.

In this city are seven parish-churches, four abbeys, three large hospitals, or alms-houses, several convents, with a chapel in which is kept a supposed miraculous host; and the Jesuits had here a magnificent house. There are in this city likewise an academy of sciences, and in 1723 a college of law was also erected here.

The walks before the city are a quarter of a league in length, planted with three rows of linden-trees, and terminated by a delightful grove. This city is the residence of the governor, the parliament, an intendancy, a taillage-office, a provincial, supreme, and particular court, a salt office, &c. The bishop is suffragan to the archbishop of Lyons, and enjoys a revenue of eighteen thousand livres a year, out of which he pays to the court of Rome twelve hundred and thirty-three florins.

Autun, the Augustodunum of the antients, stands on an eminence near three hills on the river Arux, and is about a mile in length and as much in breadth. It consists of the Upper city, which is commanded by Mount Cenis, and the Lower city, in which is the citadel, and where are held the provincial tribunal, a forest court, a salt-office, and several other courts. The bishop of this place is suffragan to the archbishop of Lyons, though he is president of the assembly of the states of Burgundy, and has a diocese of six hundred and eleven parishes and fourteen abbeys under him. His revenue amounts to seventeen thousand livres, and his taxation at the court of Rome is four thousand and eighty florins. In this city is one cathedral, five abbeys, two seminaries, two priories, one collegiate and twelve parish-churches. There was here also a college of Jesuits, and there are at present six convents, particularly a fine chartreuse, situated in the suburbs, in the church of which lie the last dukes of Burgundy, and two hospitals. In the midst of the city is an open place called The Field of Mars, and there are still the remains of three pagan temples, one of them dedicated to Janus, and another to Diana. Here are likewise two antient gates of excellent workmanship, which some have taken for triumphal arches, with a circus and the remains of a pyramid; which last, to all appearance, has been a tomb.

Auxerre, in Latin Antissiodorum, the capital of the earldom of Auxerrois, is situated on a hill near the river Yonne, ninety-two miles to the south of Paris. It has a provincial and forest court, a chamber of tythes, a salt-office, &c. and is the see of a bishop, suffragan to the archbishop of Sens; his diocese contains two hundred and thirty-eight parishes, and he has a yearly revenue of thirty-five thousand livres, out of which he pays four thousand four hundred florins to the court of Rome. His palace is a most noble structure. In this city are also a collegiate and eight parish-churches, five abbeys, six convents, one commandery of the knights of Malta; and, till the expulsion of the Jesuits, they had a seminary and a college in this city; there are here likewise two hospitals. This place, by means of the Yonne, carries on a good trade.

Trevoux, the antient Tivurtium, the capital of the principality of Dombes and of the castellany of Trevoux, is seated on a hill by the Saone, a hundred and eighty-eight miles to the south-by-west of Paris, and is the residence of a governor, a parliament, a district court, and a mint.

a mint. It is said to have derived its name from its situation on one of the highways which Agrippa made into Gaul, and which here divides into three branches. It has one chapter, three convents, and an hospital.

This city, with the little principality of Dombes, belongs to the duke of Maine, and was declared by Lewis XIV. an absolute principality. Hence the prince of Dombes has here the power of life and death, can confer nobility, coin money, and impose what taxes he pleases on his subjects, though he has his own parliament. His certain revenue is about a hundred and fifty thousand livres, and this little principality is governed by a governor-general in the prince's name.

S E C T. XV.

Of the Situation, Produce, Government, and principal Cities of the Government of Lionnois; with a particular Description of the City of Lyons.

LYONNOIS is bounded on the north by Burgundy, on the east it is separated by the Soane and Rhone from Dauphiné, on the south it is bounded by Vivarais and Velais, and on the west by Auvergne. It comprehends the three small provinces of Lyonnois, Beaujolois, and Forez; and produces corn, wine, and fruit, particularly an excellent kind of large chefnuts called marrons.

The principal rivers are the Rhone, Soane, and Loire; besides several small ones, as the Furan, Azerque, Rhin, Lignon, &c. Here is also a mine of copper and vitriol, with several mineral springs.

The courts of this government proceed according to the civil law, and appeals from them lie to the parliament of Paris. Besides its governor and general-lieutenant, it has two sub-governors, one over Lyonnois and Beaujolois, the other over Forez.

We shall begin with Lyonnois, which is about twelve French leagues in length, and seven in breadth.

Lyons, in Latin Lugdunum, the capital of the Lyonnois, and of the whole government, stands fifteen miles to the north of Vienne, in Dauphiné, at the conflux of the Soane and the Rhone; the former runs through a part of the city, and has two bridges of wood, and a narrow one of stone; but the stone bridge over the Rhone is a noble structure. This city is about a fourth part as large as Paris, and is very populous; but most of the streets are narrow. The houses, which are said to amount to four thousand, are generally high and well built, but disgraced by the raggedness and mean appearance of their paper windows; and they are said to contain above ninety thousand souls.

In Lyons are several fine squares, in one of which is the town-house, the most elegant in Europe, which was begun in 1647, and finished in 1655. It is a large building in the form of an oblong square, and on each side of the front is a wing four hundred and twenty feet in length. In the middle of the front is a tower, with a cupola on the top, and in the angles project two large pavilions. The great gate is adorned with two columns of the Ionic order, and leads into a large hall arched over, where are to be seen the busts of Philip the Fair, Charles VIII. and Henry IV. with the pictures of all the kings of France of the name of Lewis: the roof is also finely painted. There are here also the consular chamber, where the provost and the four echevins usually sit; the hall where the merchants hold their meetings; and in another hall are the pictures of the echevins. Before the house is a handsome square, in which is a large fountain.

The cathedral of Lyons is dedicated to St. John, and the chapter consists of gentlemen of the best families. They boast of their having formerly had several kings and princes, who were members of it; particularly in the thirteenth century, when at one time they had the son of an emperor, nine sons of kings, fourteen sons of dukes, thirty of counts, and twenty of barons. To this chapter belong not only the cathedral, but the churches of St. Stephen and the Holy Cross. The cathedral is indeed a large structure, particularly famous for its clock, which like that at Strasburg, is celebrated for the variety of its

motions; for at every hour a cock at the top claps his wings thrice, and crows twice, after which an angel coming out of a door, salutes the Virgin Mary, and at the same time the Holy Ghost descends, and an image of God the Father gives the benediction. The minute motion has an oval circle, and yet the hand always touches the circumference. Besides the cathedral, are three chapters or collegiate churches, thirteen parish churches, and till lately there were two colleges of Jesuits, the largest of which was the most stately in all the kingdom. This structure is a regular quadrangle, curiously painted in fresco, though something defaced on the east-side, where the winds from the mountains beat upon it. Over the front-door, and over part of the church of that college is an observatory, one of the boldest pieces of architecture in Europe. Their chapel has a fine altar-piece of lapis-lazuli, and an excellent piece of painting by Blanchard. Their library is a spacious and handsome apartment, in which were some manuscripts of the Bible, but not very ancient; but one of the most valuable pieces was a manuscript of Pliny's Natural History, of considerable antiquity.

Without the gate of St. Justus, is a large suburb where the bare-footed Carmelites have a delightful convent, with spacious gardens, from which there is a fine prospect of the city: in their church is an altar of agate and lapis-lazuli. The Capuchins have also the pretended miracles of their saint painted on the walls of their cloister, among which is one of his paying his apothecary with prayers, instead of money. The nunnery of St. Peter is a fine structure, and the parish church of St. Niegé is adorned with several fine pieces of painting by Le Brun.

In one of the squares stands an equestrian statue of brass of Lewis XIV. La Belle Cour is a spacious area, and near it are a mall and a delightful walk. The monument of the two Lovers stands on the other side of the Soane, and seems to have been some Roman building, constructed with very large stones. The Fryars in Lyons are very importunate beggars, coming into the chambers of strangers.

The arsenal here is a fine building, well stored with military implements; here are also three forts, but one of them is only garrisoned, and that serves for the prison of the city. In this city are here still to be seen some remains of Roman antiquities, as baths, aqueducts, and part of an amphitheatre.

This place is an archbishopric, and has an intendancy, a mint, with a provincial and other courts. Its archbishop is primate over the archbishoprics of Rouen, Tours, Sens, and Paris; so that appeals lie from them to him. He has also six bishops for his suffragans, with a diocese of seven hundred and sixty-four parishes, and a revenue of forty-eight thousand livres, out of which he is taxed by the court of Rome three thousand florins, and besides the title of archbishop, he has that of count of Lyons.

Round the city lie some mountains which being variegated with convents, seats, gardens, and vineyards, form a very delightful prospect.

Most of the inhabitants are makers of silk, gold, and silver laces. Formerly the looms in and about this city amounted to eighteen thousand; but in 1698, this number was found reduced to four thousand. It is still, however, in great repute for the above manufactures, particularly for its bombasines, which are admired for their beautiful lustre; and its trade extends not only over all France, but even to Spain, Italy, Switzerland, Germany, and the Netherlands.

Forez, the next division of this province, is equal in extent to Lyonnois and Beaujolois put together, and has several small towns. Its capital is Montbrison, situated on the little river Veziza, seventeen miles to the south-west of Lyons, and has several courts of justice and public offices: it has also a collegiate church, with some other churches and convents.

Beaujolois is a district ten French leagues in length, and eight in breadth. This is a very fruitful country. Its capital is Ville Franche, which is seated on the little river Morgon, near the Soane; and has a collegiate church, and an academy of the polite Arts, with several public offices.

S E C T. XVI.

Of Languedoc; its Situation, Extent, Climate, remarkable Winds, Minerals, Mountains, and Produce; with a Description of the Plant called Woad, and the Fork-Tree. The Springs and Rivers of this Province, with a Description of the Canal which forms a Communication between the Ocean and the Mediterranean. The Trade and Government of this Province; with an Account of its principal Cities, Toulouse, Narbonne, Montpellier, Nismes, with its Antiquities, and a Description of the Aqueduct called Pont du Guard, &c.

LANGUEDOC is bounded on the east by the Rhone, which separates it from Provence and Dauphiné; on the north by Lyonnois, Auvergne, and Guienne; on the west a part of it is divided by the Garonne from a part of Gascony; and on the south it terminates on the countries of Roussillon and Foix, and also on the Mediterranean. The eastern coast from Agde as far as the Rhone is remarkably increased, the sea having retired from it considerably, as evidently appears on consulting the accounts of antient geographers with respect to the situation of several of its maritime places when compared with the present. The figure of this country is very irregular; its extent, however, from east to west may be computed at about seventy leagues, but from north to south in the narrowest part it is between ten and twelve; but in the broadest westward it is almost thirty, and to the eastward near thirty-two.

The winds in this country are very remarkable. Along the southern coast, which is properly a long valley, extending from Toulouse to the sea, generally blows a west wind, though it is sometimes north and sometimes south-west. This wind gradually increases, and being cool refreshes the country in summer. The inhabitants call it *Cirs*, in conformity to its antient name *Circius*. Opposite to this blows another from the east or south-east, which is called *Autun*. This is first perceived near Narbonne, and at Castelnau-dari is very violent. It is hot, causes head-achs, with loss of appetite, and seems to swell the whole body. In the eastern part of Languedoc is frequently felt a cold and very strong north wind, which follows the course of the Rhone in the valley through which it runs from north to south, and is called *Bise*, or *Black*. Sometimes, in direct opposition to the latter, blows a sea-wind, which is usually accompanied with a drizzling rain; but when dry, has the same morbid effects as the *Autun* in Upper Languedoc: besides, in the heat of summer, from the coast of Leucate to the Rhone, sea-breezes constantly set in, at nine or ten o'clock in the morning, and, to the great refreshment of the air, last till about five in the evening. Lastly, it is also observable, that at the foot of the Pyrenees, near the village of Bland, in a narrow valley wholly environed with mountains, except towards the north-west, and through certain openings two or three hundred paces wide, blows a very cool west or north-west gale, which chiefly prevails in summer, and then only in the night. In clear and warm weather this gale is much stronger than in a thick and cold air. In summer it cools the whole valley, and in winter prevents white frosts; and, as it blows only in the night, the inhabitants of the village of Bland can winnow their corn at no other time.

This province produces some very beautiful marble, and in several places in Lower Languedoc are found turquoises. There are here also lead and iron mines.

This country is very mountainous, particularly the Cevennes, which are of great height and very steep; yet these being, as it were, the head-quarters of the Protestants, abound in people. It produces plenty of corn, fruit, and fine wine; with large plantations of olives and mulberry-trees, the latter for silk-worms and the former for oil, though this last is inferior to that of Provence. They here tread out the corn in the manner practised in the East, by causing a number of mules and horses to turn round a circle upon the grain, which is strewed under them, and afterwards also tread the straw into small pieces to save the trouble of chopping it.

Among the products of the soil may be reckoned woad, which particularly grows in Upper Languedoc. This plant has its root usually an inch thick, and a foot or a foot and a half in length, with five or six leaves growing from it, that are a foot long, and six inches broad. The flower represents a cross, and bears an oblong seed, which is sometimes of a violet, and sometimes of a yellow colour; but the former is the best. It is usually sown in February, and requires a good soil, with great care after it begins to shoot. When the herb is ripe, it is cut off close to the ground, and immediately pounded to a paste, which is made up into cakes, or balls; and these, when thoroughly dried in the sun, are reduced to a powder, which gives a very beautiful and lasting blue.

The fork-tree is also one of the curiosities of this country, though it is also found in Spain and Italy. The stem of this tree is from two to four feet high, when its farther growth is generally checked. At the top of its stem grow a considerable number of straight shoots, which are suffered to rise five or six feet, and about the third year are cut into the form of three-pronged forks; and in the sixth, seventh, and frequently not till the ninth, when they have completed their growth, are carefully cut off close to the stem, and undergo a second formation in a hot oven.

There are here several periodical and medicinal springs. The principal rivers are the Rhone; the Garonne, which issues from the Pyrenean mountains; the Aude; the Tarn, which proceeds from the Gevaudan; the Allier, which rises in the same country; and the Loire, which issues from the Vivarez, and falls into the Mediterranean.

The royal canal formed in order to make a communication between the ocean and the Mediterranean sea, that vessels might pass from one sea into the other without going round by Spain, is one of the noblest works that any country has ever produced, and therefore deserves an ample description. Under Lewis XIV. Riquet, after employing twenty years in a minute consideration of every particular, during which he had no other counsellor than his gardener, completed his plan, which he executed between the years 1666 and 1680.

This canal begins at the harbour of Cette on the Mediterranean, and traverses the lake of Thau, and a quarter of a mile below Toulouse is conveyed by three sluices into the Garonne. It is forty French leagues in length, and every where six feet deep; so that a cargo of eighteen hundred quintals may be forwarded to any place upon it, and its breadth, from one bank to the other, is a hundred and forty-four feet. In the whole canal are sixty-four large sluices, many of which consist of two, three, and four smaller ones, by means of which the water is confined in the rising grounds.

At St. Ferreol, a quarter of a mile below Revel, between two rocky hills, that are in the form of a half-moon, is a large reservoir twelve hundred fathoms in length, five hundred in breadth, and twenty deep, the whole surface being six hundred and eighty-seven thousand four hundred and thirty-eight feet. Into this basin of water the rivulet of Laudot, which runs down the hills, is received, and enclosed by a wall two thousand four hundred feet long, a hundred and thirty-two in height, and twenty-four feet thick, having a strong dam defended by a strong wall of free-stone. Under the dam runs an arched passage reaching to the main wall, where three large cocks, of cast brass, are turned and shut by means of iron bars; and these cocks discharge the water through mouths as large as a man's body into an arched aqueduct, where it runs through the outer wall, and when got beyond it goes on under the name of the river Laudot, continuing its course to the canal called *Rigole de la Plaine*. From thence it is conveyed to another fine reservoir near Naurouse, two hundred fathoms in length, a hundred and fifty in breadth, with the depth of seven feet; and out of this basin it is conveyed by means of sluices, as well to the Mediterranean sea as to the ocean, according as the canal wants it. Though the above cocks remain open for some months successively, yet there is no visible diminution of the water in the great reservoir. Near Beziers are eight sluices, which form a regular and

grand cascade nine hundred and thirty-six feet long, and sixty-six high, by means of which vessels may pass cross the river Orb, and continue their voyage on the canal. Above it, between Bezieres and Gapestan, is the Mal Pas, where the canal is conveyed for the length of a hundred and twenty fathoms under a mountain cut into a very lofty arcade, the greatest part of which is lined with free-stone, except towards the end, where it is only hewn through the rock, which is of a soft sulphureous substance. At Agde is a round sluice, with three openings, three different depths of the water meeting there; and the gates are so ingeniously contrived, that vessels may pass through by opening which the master pleases; an invention which struck the great Vauban himself with admiration. The lesser rivers and streams that might have prejudiced the canal have been carried under it by water-courses, of which there are forty-four, and eight bridges.

This canal cost thirteen millions of livres, part of which money was furnished by the king, and part by the states of Languedoc. The king generously granted to Riquet, the inventor, and his male heirs, all the jurisdiction and revenues belonging to it; so that the crown does not come into possession till the extinction of that line. Ships passing on it for every hundred weight pay twenty sous, and even the king himself pays the same toll for military stores, &c. sent by way of this canal; so that the revenue, especially in time of a brisk trade, is very considerable. However, the charges attending it are also very great; for the salaries of the several directors, receivers, comptrollers, lieutenants, clerks, and watchmen, annually amount to one hundred thousand livres, besides the great expence of repairs. The counts of Caraman, descendants of the above-mentioned Riquet, are also obliged to keep passage-boats, which are drawn by mules or horses; and though there are no passengers, they must go and come at stated times.

The coast of Languedoc is dangerous, and also in want of good and secure harbours. With respect to its trade, the city of Montpellier, by means of the river Lez, and the lakes near it, carries on, at the harbour of Cette, the greatest maritime trade in all the province; but the whole is not very considerable. The commerce of this province principally consists of manufactures and other goods. Wine is exported hence to the coasts of Italy; oil to Switzerland and Germany; and, when the harvest is uncommonly good, corn to Italy and Spain; dried chefnuts and raisins are sent to Tunis and Algiers; and cloth to Switzerland, Germany, and the Levant.

Towards the middle of the sixteenth century the Reformation made an extraordinary progress in this country; but was soon attended with civil war, and all the rage of persecution, which was carried on here with greater fury than in other parts of France; and Languedoc was the scene of continual troubles and cruelties for above an hundred years; but though more blood was shed here than in the whole kingdom besides, there are still in this province a great number of secret Protestants.

The Popish clergy are here extremely numerous and wealthy, there being in Languedoc three archbishops and twenty bishops, and the whole ecclesiastical revenues amount to twenty-five millions forty-one thousand eight hundred and fifty-two livres per annum. It has also a great number of inferior courts subject to the supreme ones, which are the parliament of Toulouse, and the chamber of accounts and taxes at Montpellier. The governors of districts here resemble the bailiffs in the other provinces, and are eight in number. Every district has a court of justice, to which lie appeals from the Vigueries or royal courts. In it is also a superior forest court, with seven dependent on it. The parliament consists of the clergy, the nobility, and the commons, who are called together by the king every October. Under the governor of Languedoc are three general lieutenants, namely, one over Upper Languedoc, the second over Lower Languedoc, and the third over the dioceses of Nismes, Alais, Mende, Puy, Viviers, and Uzes. It has also nine inferior governors, each of which has his respective department.

The principal places in this province are the following:

Toulouse, or Thoulouse, the capital of Languedoc, and one of the most ancient cities in the kingdom, is situated in latitude forty-three degrees thirty-five minutes forty seconds, and in one degree ten minutes east longitude, in a district called the Toulousain, in a most delightful plain on the Garonne, and, next to Paris, is said to be the largest city in all France. The streets are mostly broad, and the houses built of brick; it is not, however, very populous, and though so finely situated, its trade is inconsiderable, its principal article being Spanish wool. This is chiefly imputed to the vanity of the merchants, who no sooner acquire a considerable fortune, than they make it their chief aim to obtain a seat in the city council, and to lay aside all commerce.

This city is the seat of an intendency and receiver's office, of a governor, a provincial court, a royal tribunal, an admiralty, a forest court, a mint, and other public offices; it is also the residence of an archbishop, and the second parliament of the kingdom. The diocese of the archbishop contains two hundred and fifty parishes, his revenue amounts to sixty thousand livres a year, and his taxation at the court of Rome is five thousand florins.

The cathedral is an ancient handsome structure, but contains nothing remarkable: in the spacious area before it is a fountain, over which is an obelisk curiously wrought. In the church of St. Sernin, or St. Saturnin, are said to lie thirty bodies of saints, and among them seven of the Apostles, one of whom they pretend to be St. James the Younger, though St. Jago de Compostella in Spain also boasts of being possessed of the body of that apostle. Near this city stands a secularized abbey. The church of La Dorade is thus called from a gilded, but now a coal black image of the Virgin Mary, which stands on the great altar, and in any time of calamity is the constant refuge of the inhabitants. The name of the statuary was Luke, which being marked on the base, has made the common people imagine that this image was carved by St. Luke. The church of the Carmelites has a large and magnificent chapel; that of the Dominicans is also large and splendid. Under the choir of the Franciscan church is a vault, where bodies dry without mouldering or putrefaction; but become extremely light. The society of the Blue Penitents in this city is one of the most renowned fraternities in the whole kingdom, having in its registers kings, princes of the blood, and eminent ecclesiastics.

The university of Toulouse is reputed the second in France, and consists of several colleges. The four faculties, namely, divinity, law, philosophy, and physic, with the liberal arts, are taught here. Here is also an academy of polite literature, founded by royal patent in September 1694; it is composed of a chancellor, and forty-two members or fellows, who employ their talents chiefly in poetry. This is in the room of a society called the Floral Games; and still every year, on the third day of May, they give away four prizes, one gold and three silver flowers, to those who distinguish themselves by writing the best copy of verses.

The above society meet in the town-house, which is a spacious building called the Capitolium, in which there is a white marble statue of Clementia, who is said to have instituted the above-mentioned Floral prizes in the year 1540. The hall of this structure is adorned with the busts of the illustrious and celebrated natives of Toulouse, as also of two Gothic kings, some counts of Toulouse, and several distinguished civilians. There are here preserved five large parchment folios, finely written and illuminated, being the annals of the city from the year 1288 to the present time.

Here is also an academy of the sciences and liberal arts. The stone bridge over the Garonne, which is a hundred and thirty-five fathoms long, and twelve broad, rests on seven arches of different magnitudes; but, except the cantons, which are of stone, is wholly built of brick. In this city are made Bergamo carpets, but of little value, together with some slight silk and woollen stuffs.

Narbonne, the ancient Narbo, is a fortified city, sixty-four miles to the west of Montpellier, seated on a canal which passes through it, and joins the river Aude. It is the residence of an archbishop, whose province contains a hundred

a hundred and forty-four parishes, and its revenue amounts to ninety thousand livres per annum, out of which he pays at Rome nine thousand florins. The cathedral, called St. Justus and St. Pastor, is remarkable for its fine organs and curious painting, in which are represented the raising of Lazarus from the dead, the last judgment, and other pieces. There are also five other parish-churches, the principal of which is the collegiate church of St. Paul, with a college of the fathers of the Christian doctrine, and several convents for persons of both sexes. The remains of Roman antiquities still to be seen here consist of stones and inscriptions, chiefly placed in the walls of the court of the archbishop's palace, and in the garden is a beautiful Roman sepulchre of white marble.

Montpellier, in Latin Mons Pessalanus, is seated on a hill by the river Lez, fifty miles to the north-east of Narbonne, and, next to Toulouse, is the most considerable city in all Languedoc. It contains a chamber of taxes and accompts, with an intendancy, a treasurer's office, a provincial court of justice, a sheriff's court, an independent court, a forest court, a mint, &c. It has many fine houses; but the streets are very narrow, which is attended with this convenience, that in hot weather they have linen awnings drawn over them, under which a person may walk without being incommoded by the sun. The air here is so pleasant and healthy, that numbers of foreigners, and especially of the English, resort hither for the recovery of their health, particularly when labouring under hectic disorders. The city is adorned with several stately edifices, as the hall of justice, the churches of St. Peter and the Virgin Mary, and a strong citadel, flanked with four royal bastions, which commands the town and the neighbouring country. In the square of Lewis the Great, which is without the city, is the pleasant walk of Peyron, in which stands an equestrian statue of that monarch in bronze, upon a pedestal of a greyish white marble. This the states of Languedoc erected in honour of him. The city gate leading to this square is built in the form of a triumphal arch. The bishop of this place is subject to the archbishop of Narbonne; his diocese contains a hundred and seven parishes; his revenue is thirty-two thousand livres, and he is taxed at the court of Rome four thousand florins.

The university here is particularly famous for physic, it being founded by physicians who were expelled Spain in the year 1180. The celebrated scarlet gown of Rabelais, with which all doctors of physic are invested at taking their degrees, has long since ceased to be an original, the students having, from time to time, cut off little slips, so that the robe now used is said to be at least the third or fourth substitute. In 1706, a royal academy of sciences was founded here, and they have an excellent physic garden, in which public lectures on botany are read. The inhabitants are principally employed in making verdigris, likewise in dimities, silks, and woollen stuffs; they have also a considerable trade in wool brought from the Mediterranean, in wine, aquavita, Hungary water, cinnamon-water, &c.

This city formerly belonged to the protestants, as one of their cautionary towns; and though Henry IV. made over to them this and other places, his son Lewis XIII. took it from them after a vigorous defence in 1622.

Frontigniac, or Frontignan, a small town seated on the lake of Thau, seventeen miles to the south-west of Montpellier, is remarkable for its excellent muscadine wine, its jar-raisons, and its handsome town-house. This wine is called by the English Frontiniac. The above lake, which is also called Maguleone, is twelve leagues in length, and separated from the sea only by a narrow tract of land; but in one place has a communication with the gulf of Lyons, which, according to Dr. Busching, takes not its name from the city of Lyons, which is seated at a great distance from the sea, but rather from the violent storms so frequent in this shallow part of the Mediterranean, and which destroy the ships as a furious lion does its prey.

Nîmes, or Nimes, in Latin Nemausus, a large city, thirty miles to the north of Montpellier, is very pleasantly situated, it having on one side, hills covered with vines, and on the other, a very fertile plain. The streets are in general narrow, but kept pretty clean, and the

houses of stone handsomely built. One-third of the inhabitants are secret protestants. Here is a collector's office, an intendancy, and a provincial court of justice. Its bishop is suffragan to the archbishop of Narbonne, and his diocese contains two hundred and fifteen parishes: he has an annual revenue of twenty-six thousand livres, out of which his taxation at the court of Rome is twelve hundred florins. In this city are several convents, and it had a jesuit's college; it has an academy of polite literature, founded in 1682; and is defended by a citadel consisting of four bastions. There are here such a multitude of manufacturers, that its cloth and silk trade alone exceeds that of the whole province.

In the city and its neighbourhood are several illustrious monuments of antiquity: one of the principal of these is an amphitheatre, said to be the least damaged of any in Europe. It is built of free-stone, the outside of which is very entire, the stones are in many places of an amazing length and thickness: it is two stories high, and has sixty arches and columns in each story; on these and their cornices are to be seen the Roman eagles, with figures of Romulus and Remus sucking a wolf. The steps or seats are ruined, and the arena filled with houses. Over the large entrance are two half bulls cut in stone, also a triple and winged Priapus, and the figure of a woman holding by a bridle.

The other antiquities are an oblong structure embellished with thirty-two columns of the Corinthian order, supposed to be a temple erected by the emperor Adrian in honour of Plotina, consort to Trajan. A temple consisting of most beautiful free-stone, above half of which is still standing, and is supposed to have been dedicated to Diana; and close by it is the fountain of Diana mentioned by Ausonius, which first diffusing itself into a deep and wide pond, furnishes water enough to supply all the gardens of the city. From several remains, it appears that this was a public bath. Here is also an octangular tower fifteen fathoms high, the whole being a solid structure from the bottom to the top. It is remarkable, that the heads of all the Roman eagles found here are struck off; which is imputed to the Goths, who, on their reduction of this country, are supposed to have done this by way of insult of the haughty enemy they had subdued. The esplanade or walking-place without the city, is extremely delightful.

At no great distance from the city, and a mile and a half from the market-town of Remoulins, is a bridge called the Pont du Gard, a most valuable piece of Roman antiquity, it being part of the great aqueduct by which the spring of Eure was carried the length of nine hours distance to Nîmes, and there distributed in the amphitheatre, public fountains, and private houses. The above bridge consists of three ranges of arches, built one upon another, over the river Gardon, and thus connecting the high rocks on both sides the river, so as to afford a free passage to the water of the spring above-mentioned from one mountain to the other. The lower part consists of six arches, four hundred and thirty-eight feet in length, and eighty-three in height. The second consists of eleven arches each, fifty-six feet in diameter, and sixty-seven in height; and is of such an extraordinary width, that, besides the pillars on which the upper part or range of arches rests, there is a horse and foot-way leading through it, secured by a breast-work. The third range, which rests on the second, and is five hundred and eighty-five feet and a half in length, consists of thirty-five arches, each of which is seventeen feet in diameter; and over this uppermost range runs the aqueduct, which is of such a height and breadth, that with a little inclination of the body a person may walk in it. The whole is of a very hard and durable free-stone. From an eminence towards Uzes, a small episcopal town near the spring of Eure, are here and there seen entire ranges of arches, all which belong to this vast aqueduct.

Quissac is a small place seated on the Vidourle, between which and the town of Sauve, at the foot of a mountain near the river, is a periodical spring, which runs and intermits twice in twenty-four hours. The flow lasts seven hours twenty-five minutes, and the intermission five hours. This is supposed to be occasioned by a cave or reservoir in the mountain, which being filled every

every five hours, discharges itself through a canal in the form of a siphon. This water is drank as a mineral, and when heated is used for bathing. It contains a considerable quantity of sulphur, and is reputed very good for all disorders of the eyes.

In Languedoc is the district of Albigeois, from whence the Albigenes take their name, they being a brave and upright people, who so early as the eleventh century opposed popery, and adhered to the doctrines of the Gospel, amidst the violent persecutions which their integrity drew upon them. The country produces plenty of corn, wine, fruit, and saffron; but the people are poor.

The capital of this country is Alby, which stands on an eminence near the river Tarn; it is the residence of an archbishop, and has a royal tribunal, with several other courts. This diocese contains three hundred and twenty-seven parish churches, and the annual revenue of the archbishop amounts to ninety-five thousand livres, out of which he pays two thousand florins to the court of Rome. He is lord also of the city, though the high and low jurisdiction, and the high domains, are in the king's hands. The cathedral is one of the richest and finest buildings in the kingdom: the archiepiscopal palace is also very noble. The walk called La Lice, a little above the city, is extremely pleasant, and the little town of Chateaufieux forms a handsome suburb. At a council held here in 1176 the doctrines of the Albigenes were anathematized.

Alais, or Alez, a pretty large populous city seated on the river Gardon, thirty-five miles to the north of Montpellier. It is the see of a bishop suffragan to the archbishop of Narbonne, who has an annual revenue of sixteen thousand livres, out of which he pays to the court of Rome five hundred florins. This diocese consists of eighty parishes, and the bishopric was founded so lately as the year 1691, in order to bring over to the church of Rome the great number of Protestants in that part of the country, and a college of Jesuits was added as auxiliaries to it. The quantity of unwrought silk annually carried out of this city, is said to amount to at least one million two hundred thousand pounds weight.

S E C T. XVII.

Of the Governments of Roussillon and Foix; their Situation, Extent, Mountains, Produce, Rivers, and Trade; with a Description of the City of Perpignan.

THE county of Roussillon is separated to the north from Languedoc by the Lesser Pyrenees, to the east it borders on the Mediterranean, and to the south and west is divided by the large Pyrenean mountains from Catalonia and Cerdagne. Its length from east to west is above fifty miles, and it is twenty-five in breadth. Its name of Roussillon is derived from its ancient capital Ruscino.

Among the several mountains here, the highest are those of Massane and Canigou; the latter of which is said to be fourteen hundred fathoms in height. This country is on all sides environed with mountains; and the summer-heats are so intense, that the inhabitants are almost universally swarthy and meagre.

The soil is very fruitful in corn, wine, and forage; and in some parts so uncommonly fertile, that, after the corn harvest is got in, they sow millet, and thus procure two, and sometimes three harvests in a year. Mules are here used for the plough. The great wealth of the country consists in olives and oranges, which are almost as common here as apples and pears in Normandy. They have very little wood, and that only of shrubs; and from their want of navigable rivers, the only way of being supplied with goods from other countries is by means of mules.

The inhabitants have a considerable number of sheep, which are much esteemed for the uncommon delicacy of their flesh. Oxen are also fattened here, for the gratification of the wealthy; but the breeding of cows is neglected, their milk being bad; however, the pigeons, quails, and partridges of Roussillon are excellent. The chief branch of trade in this province is oil, which they sell

to the annual amount of two hundred thousand livres; they also export corn, millet, and wool.

The Tet, Tec, and Agly, its only rivers, are no more than rapid brooks, which discharge themselves into the sea. Here are also hot baths, and at Cannet and the lake of St. Nazaire the sea-water is conveyed into canals, and there converted into salt by the heat of the sun.

This county, which formerly belonged to the king of Arragon, was taken by Lewis XIII. and by the peace of the Pyrenees in 1669 was ceded to France. It contains but one bishopric. At Perpignan is a superior court, or council, to which he appeals from all the inferior courts. In it is also a mint. The contributions payable by the inhabitants consist of a poll-tax, which produces about forty thousand livres. This country, besides a governor, has a lieutenant-general, and deputy-governor.

Perpignan, in Latin Perpeniacum, the capital of the country, is seated on the river Tet, sixty-five miles to the north-east of Bourdeaux, partly in a plain, and partly on a hill. It is fortified with a high and thick wall, strengthened with bastions: it has also a citadel, which is a fine work, and the suburbs are likewise defended by a fort. It is, however, a place of no great extent; but is very populous, there being here a superior royal council, or high court of justice, an intendency, a chancery, a salt-office, and a mint. Its bishop is suffragan to the archbishop of Narbonne, and has a diocese of a hundred and eighty parishes. His revenue is about eighteen thousand livres, out of which he is taxed by the court of Rome fifteen hundred florins. Besides the cathedral it has four parish-churches, a seminary, twelve convents, and had two colleges of Jesuits. It has likewise an university founded in 1349, with several alms-houses and hospitals. Among the other public buildings is a large cannon foundery. The greatest disadvantage of this city is the want of good water fit for drinking.

We now come to the government of Foix, which contains the district and county of Foix, with the territories of Andorre and Donezan. It is bounded on the north and east by Languedoc, on the south by the Pyrenean mountains and Roussillon, and on the west by Gascony. The principal rivers are the Auviege and the Rize. This country is a dependency of the parliament of Toulouse, and constitutes part of the lands of the states, who are annually called together by the king. Its trade consists of cattle, raisins, turpentine, pitch, cork, jasper, and particularly iron; and, besides, the governor has a lieutenant-general.

Upper Foix lies among the mountains, and all its products are wood, iron, and mineral waters, with some pastures. In this country are several caverns, in which are very singular figures formed by the petrifying waters. Lower Foix produces some grain and wine. There are in this government four principal towns; but these are very small, and too inconsiderable to require any description.

The little district and sovereignty of Donezan, just mentioned, is nine miles in length, and the same in breadth; it is separated from the county of Foix by a chain of mountains, and contains nine market-towns and villages; and the territory or valley of Andorre has also several villages.

S E C T. XVIII.

Of the Government of Lower Navarre and Bearn; their Situation, Extent, History, Produce, and principal Cities.

WE have already described that part of Navarre which belongs to Spain, in treating of that kingdom, and now come to French or Lower Navarre, which is united under the same government with the principality of Bearn. These two contiguous countries are bounded on the north and east by Gascony, on the south by the Pyrenean mountains, and on the west by another part of Gascony.

Lower Navarre is one of the six bailiwicks which formerly composed the kingdom of Navarre; but in 1512 Ferdinand, king of Arragon and Castile, having, under frivolous

frivolous pretences, possessed himself of the kingdom of Navarre, all that Catharine, the lawful heiress, and her husband John d'Albret, could procure to be restored to them was this little spot. They were also possessed of Bearne. John, their son, had no better success; he possessed the same countries, but the title of sovereign was confined to the scanty remnant of Navarre, which was called a kingdom. Johanna, his daughter, in 1584, married Anthony of Bourbon, to whom she brought the above-mentioned countries as a dowry. Their son Henry IV. arrived to be king of France, and his son and successor Lewis XIII. annexed Lower Navarre and Bearne to the crown of France.

The kingdom or province of Lower Navarre, separately considered, is bounded on the north by Gascony; on the east by a part of Gascony and Bearne; on the south it is separated from Upper Spanish Navarre by the Pyrenean mountains; and on the west borders on Labourd, a district of Gascony; it extending only twenty-four miles in length, and fifteen in breadth.

The country is mountainous, and produces little. The inhabitants speak the Basque dialect, which is the same with that of Biscay. The principal rivers are small; these are the Nive, which has its source in the Spanish mountains, and the Bidouse, which has its source here, and both fall into the Adour.

In the whole country of Lower Navarre there is neither abbey, collegiate church, nor convent; the only ecclesiastical buildings remaining here being four parochial priories. The Reformation took place here under the reign of Henry II. king of Navarre; but in 1694, there was, at least in appearance, a general return to the Romish church. In Bearne are two bishopricks. The whole government is subject to the jurisdiction of the parliament of Pau: yet both Lower Navarre and Bearn have states of their own, each paying the king annually four thousand eight hundred and sixty livres, as an ordinary contingent, with two thousand more to the maintenance of the troops. To the governor they allow seven thousand seven hundred and forty, and to the deputy-governor two thousand seven hundred and forty.

Lower Navarre is divided into five districts, the principal place in which is the following:

St. Jean Pie de Port, or St. John at the Foot of the Gate, which is situated at the entrance of the pass that leads through the Pyrenean mountains into Spain. It stands on the river Nive, twenty miles to the south-east of Bayonne, and has a citadel placed on an eminence that commands the above pass.

In Lower Navarre are only three or four other small towns, and some small villages.

The principality of Bearn is of much greater extent, it being about forty-eight miles in length, and thirty-six in breadth; but is mountainous, and, except in the plains, generally barren. However, some of the mountains contain mines of copper, iron, and lead, and are covered with pines fit for masts and planks; very little wheat or rye is produced in this country; but great quantities of mailloc, which is a kind of Indian corn, and also flax: but the very rocks are planted with vines, and in some places the inhabitants make excellent wine.

The principal cities in this principality are Pau, Oleron, and Navarreins.

Pau, in Latin Palum, the capital, stands on an eminence, at the foot of which runs the river Gave Bernois. It is ninety-seven miles to the south of Bourdeaux, and is the seat of a parliament and a bailiwick. It has a castle in which king Henry IV. of France was born. It has five convents, two hospitals, and at the late expulsion of the Jesuits they had a college here. It is a small but pretty town, and has manufactures of cloth.

Oleron, a small but populous city, seated on the banks of the river Gave, which, from this city, is called the Gave of Oleron, ten miles to the west of Pau. It has a bailiwick court, and is the see of a bishop, who is suffragan to the archbishop of Auch, and has a diocese containing two hundred and seventy-three parishes, with a yearly revenue of thirteen thousand livres, out of which he pays six hundred florins to the court of Rome. Its trade was formerly much more considerable than it is at present.

Navarreins, a town built by Henry d'Albret, king of Navarre, and prince of Bearne, is also situated on the Gave of Oleron, sixteen miles to the south of Bayonne. It stands in the midst of a fertile plain, and is a square city pretty well built. It is the seat of a governor, and a king's lieutenant. It is surrounded with walls; but is not very strong, it being commanded by the neighbouring hills.

SECT. XIX.

Of Guienne and Gascony; their Situation, Extent, Produce, Rivers, History, Government, and principal Cities; particularly Bourdeaux, Perigord, Agen, Montauban, Auch, and Bayonne.

THE government of Guienne and Gascony is bounded on the north by Saintonge, Angoumois, Limosin, and Auvergne; on the east by Auvergne and Languedoc; on the south by the Pyrenean mountains; and on the west by the bay of Biscay. Its extent from south to north is about eighty leagues, and from east to west about ninety. This country was formerly a part of the ancient kingdom of Aquitaine, and abounds in corn, wine, fruit, hemp, and tobacco. Its trade in wine in particular is so very considerable, that the city of Bourdeaux alone exports annually a hundred thousand tons. It also produces brandy, prunes, and many other commodities. It has likewise mines of copper, and fine quarries of marble of all colours.

It has several springs of medicinal waters, and its principal rivers are the Garonne, which receives many small streams, and the Adour, which rises in the mountains of Bigorre, and falls into the ocean.

Charlemagne created his son Lewis king of Aquitaine, but soon after this kingdom was divided into the duchies of Aquitaine and Gascony, which, by the marriage of William IV. duke of Aquitaine, with Briske, heiress to Gascony, were united, and continued in that family till the year 1150, when, by the marriage of Eleanor with Henry II. king of England, this duchy fell to that crown, and during almost three hundred years was subject to the English, who were dispossessed of it by Charles VII. in 1453. Lewis XI. in 1469, conferred it on his brother Charles, who was the last duke of Guienne, it being on his decease again annexed to the crown of France. However, in 1753 the title of duke of Aquitaine was revived in the person of the Dauphin's second son.

In this government is an archbishop, with nine suffragans. It also contains two generalities, namely, that of Bourdeaux, which is under the parliament of that city, and that of Montauban under the parliament of Toulouse. The former is composed of nine, and the latter of four large seneschalships, or bailiwicks. In each is also a court of aids, under the direction of the governor, whose salary amounts to about ten thousand livres; with two lieutenant-generals, one for Guienne, and the other for Gascony and Bigorre. Besides these, there are thirteen other deputy-governors.

Bourdeaux, in Latin Burdigala, the capital of Guienne, is seated on the Garonne, in the forty-fourth degree fifty minutes north latitude, and in forty minutes west longitude, two hundred and sixty miles to the south-west of Paris. It is pretty large and populous, it having a great number of stately houses built of stone; but they are old, and the streets very narrow. The inhabitants are said to amount to forty thousand. The newest and handsomest part of the city is the Royal square, near the harbour, in which stands a grand magazine, with the exchange, and it is adorned with a statue of Lewis XIV. in brass. This city is a place of considerable traffic, it being resorted to by merchants from most parts of Europe. Its haven, which is very capacious and safe, is called Le Port de la Lune, or the Port of the Moon, from its being in the form of a crescent. The tide flows into it very high, and carries ships of large burthen up to the quay. The city itself is in the form of a triangle, the two short sides towards the sea, and the largest towards the river Garonne. The palace, the town-house, the handsome markets, the public fountains, the quay, and the

the cathedral dedicated to St. Andrew, are worthy the curiosity of a traveller; as is also the castle called the Chateau-Trompette, which stands at the entrance of the quay, and commands the whole harbour. There is also another castle at the other end of the quay, called Le Chateau de Haa, which is also very strong: in both these fortresses there is a garrison constantly kept. There is also a fort called St. Louis, or St. Croix; but it is of no great importance. During the reign of Lewis XIV. Bourdeaux was fortified in the modern taste by Vauban; but the ramparts are now said to be ruinous. At the mouth of the Garonne, six leagues below the city, stands on a small island a stately watch-tower, where they light flambeaux every night for the direction and security of such vessels as sail up or down that river; a precaution the more necessary, on account of the many rocks and shelves which lie in it.

This city is the see of an archbishop, the seat of a parliament, a court of aids, a seneschalship, a provincial tribunal, an admiralty, and of a treasurer's office. It has also an exchange and a mint. The archbishop has nine suffragans under him, with a province of four hundred and fifty parishes, besides about fifty chapels of ease. His revenue is fifty-five thousand livres per annum, and his taxation at the court of Rome four thousand florins. The cathedral is a large Gothic structure, which contains nothing remarkable but the silver shrine of relics on the great altar. The church and convent of the Dominicans are new and elegant structures, but those belonging to the Carthusians have a splendor seldom seen in any convents of that order. In this city is likewise an abbey of Benedictines of the order of St. Maur. The Jesuits had, till their expulsion, a fine college here. The university was founded in 1441, and in 1712 the king erected here an academy of the sciences and polite arts, the library to which does not contain a great number of books, but consists entirely of select pieces, placed in a most elegant hall.

There are still here some visible remains of Roman antiquities, particularly an amphitheatre built by the emperor Gallienus, whose palace it is called; only some parts of the side walls are standing, with the two principal gates.

The trade of this city is very considerable, and for its improvement a kind of toleration is granted to the English, Dutch, Danes, Hamburgers, and Lubeckers, and even to the Portuguese Jews; but these last have no synagogue, nor are any Protestants indulged in the public exercise of their religious worship, only the English are connived at and have a minister in a lay habit, and the other foreign Protestants are not prohibited reading a sermon privately to their families. The Scots, on account of the services they formerly performed for the French, have considerable privileges allowed them in this city, and a gate of Bourdeaux bears the ensigns of one of the name of Douglas; even to this day Scottish vessels have peculiar immunities allowed them in trade, and from this port they generally ship their wines. In this city Edward the Black Prince resided for some years, during which time his son, afterwards Richard II. king of England, was born.

Perigueux, the capital of a very large district named Perigord, the see of a bishop and the seat of a bailiwick, and a court of justice, is seated on the river Isle, in a fine country, sixty-five miles to the north-east of Bourdeaux; the bishop is subordinate to the archbishop of Bourdeaux, and has a diocese containing four hundred and fifty parishes, with a revenue of twenty-four thousand livres, out of which he is taxed two thousand five hundred and ninety florins at the court of Rome. It has four convents, one hospital, and had a college of Jesuits. The old town is called La Cité, and the new town, which is about a hundred paces distant, is named La Ville.

Agen, the capital of a district called the Agenois, is pretty large and well inhabited. It is seated on the river Garonne, seventy-five miles to the south-east of Bourdeaux. The bishop styles himself count of Agen, but this is only a titular honour; he is suffragan to the archbishop of Bourdeaux, under whom he has a diocese of three hundred and seventy-three parishes, and one hun-

dred and ninety-one chapels of ease, with a yearly revenue of thirty-five thousand livres, out of which he is taxed by the court of Rome, two thousand four hundred and forty florins. There is here a cathedral and a collegiate church, two parish churches, with several convents; and there was here a college of Jesuits. This city is finely situated for trade, but makes little advantage of it.

Montauban, in Latin Mons Albanus, a well-built handsome city, in the district of Lower Quercy, is seated on the river Tarn, twenty-seven miles to the north of Toulouse, and is the see of a bishop, with the seat of a court of aids, a provincial court, and a bailiwick. It properly consists of three parts, the Old and New Towns, with the town of Bourbon, which lies on the other side of the river, and is a suburb. The bishop is suffragan to the archbishop of Toulouse, and has a diocese of ninety-six parishes, with a revenue of twenty-five thousand livres per annum, out of which he pays a tax of two thousand five hundred florins to the court of Rome. In this city are two collegiate churches, an academy of polite literature, one seminary, eight convents, and a general hospital; it had also till lately a college of Jesuits. Its principal trade consists in woollen stuffs.

In 1562, the inhabitants became Protestants, and fortified the city in so strong a manner, that Lewis XIII. besieged it in 1621 without success, and was unable to reduce it till the year 1629, when he caused its fortifications to be razed.

Gascony, called by the French Gascogne, constitutes the south part of the government of Guienne, and includes the country lying between the Garonne, the ocean, and the Pyrenean mountains. It receives its name from the Gascones and Vascones, by the moderns called Basques or Vasques, a people who lived on the Pyrenean mountains in Spain, and towards the close of the sixth century settled on the north-side of the Pyrenees, where they defended themselves against the Franks; but were at last obliged to submit. It is bounded on the north by Guienne; on the west by Languedoc and the county of Foix; on the south by the Pyrenean mountains, which separate it from Spain; and on the west by the sea of Gascony. The inhabitants are said to have quick parts, but are so addicted to boasting, that the name of Gasconade has been given to all bragging stories. The country is not very fertile, it producing little corn, tho' it has great plenty of fruit, and the mountains afford timber fit for building of ships. The principal places in this province are the following.

Auch, the ancient Elusaberris, and afterwards Augusta, is the capital of the district of Armagnac, and of all Gascony. It stands on the side and top of a hill, at the foot of which runs the river Gers, thirty-seven miles to the west of Toulouse, and is divided into the Upper and Lower Town, between which there is a communication by means of two hundred stone steps. This place is the see of an archbishop, and has an intendency, a treasurer's office, a bailiwick, a provincial and royal court. The lordship of the city is divided between the archbishop and the count of Armagnac. The diocese consists of three hundred and seventy-two parish churches, and two hundred and seventy-seven chapels of ease, and the revenue of the archbishop is ninety thousand livres, out of which he pays to the court of Rome ten thousand florins. The cathedral is one of the most magnificent in the kingdom; the chapter is composed of fifteen dignitaries, and twenty-five canons; and among the latter there are five who are only honorary. The king himself is the first of them, as count of Armagnac; the four others are the barons of Montsquier, Montaut, Pardailhan, and L'Isle.

Bayonne, in Latin Lapurdum, the capital of the district of Labourd, is seated in the forty-third degree thirty minutes north latitude, and in one degree twenty minutes west longitude, at the junction of the Adour and Nive, near the mouth of the former, and a little below the city they discharge themselves into the bay of Biscay. It is of pretty considerable extent, and is the see of a bishop; it has also a bailiwick court, an admiralty, and a mint. The name of Bayonne is compounded of two Basque words, Baia and Ona, signifying a good harbour, and

and it well deserves that title; it is accordingly much frequented, though the shallows render the entrance to it somewhat difficult.

This is the only place in France that has the advantage of being situated on two rivers, into which the tide flows; the Nive runs through it, and the Adour close by its walls; soon after which they unite, and divide the city into three parts: that called the Great Town, lies on the side of the Nive; the Little Town is between the Nive and the Adour; and the suburb of St. Esprit, in which great numbers of Jews reside, lies on the other side of the river. The two first parts, besides their other works, have each a small fort; the suburb has good fortifications, and a regular square citadel, which standing on an eminence, commands the three several parts of the city, the harbour, and the adjacent country. Most of these works have been repaired and improved by Vauban; for though the city is not very large, it is of the utmost importance, from its being one of the keys of France on the side of Spain.

Besides its cathedral and collegiate church, the suburb also has another collegiate church; in this city are likewise five convents, and one college. But neither the cathedral, which is dedicated to the Holy Virgin, nor any of the other public or private buildings, have any thing remarkable. Its bishop is suffragan to the archbishop of Auch, and his diocese contains seventy-two parishes. He has a revenue of nineteen hundred livres, out of which he pays only a hundred florins to the court of Rome.

SECT. XX.

Of the Situation, Extent, Produce, and Rivers of the Government of Auvergne; with an Account of its principal Cities.

THE government of Auvergne, which takes its name from its ancient inhabitants the Arverni, is bounded on the north by Bourbonnois; on the east by Forez, a large district in the government of Lionnois; on the south by Guienne and the Cevennes; and on the west by Limosin, the district of Quercy in Guienne, and La Marche; and is about a hundred miles in length, and seventy-five in breadth.

Lower Auvergne is a very pleasant fertile country, abounding in corn, wine, fruit, forage, and hemp; it far excels Upper Auvergne, which is cold, and full of mountains, that are covered with snow seven or eight months in the year, though its pastures are excellent, and the inhabitants deal largely in cattle. The situation of the mountains occasions the winds blowing in such eddies, that no wind-mills succeed there.

The principal rivers are the Allier, which rises in the Gevaudan, and falls into the Loire; the Dordogne, which springs from Mont d'Or, the highest mountain in the country; the Allagnon, which rises in Mount Cantal, and after a rapid course falls into the river Allier.

The highest mountains in this country are Le Pui de Dome, the perpendicular height of which is eight hundred and ten fathoms; the Cantal nine hundred and eighty-four; and Mont d'Or one hundred and thirty: the two latter are no less famous for the curious plants that grow on them. At Pontgibaud is a silver mine, but the produce not answering the expence, the working of it has been discontinued; however, the coal mines in the neighbourhood of Brifac are very profitable.

Besides the corn, wine, cattle, cheese, coals, and other products of the earth, this country carries on many manufactures, as all kinds of silk stuffs, cloths, very beautiful laces, and paper, which is esteemed the best in all Europe. Every year some thousands of labourers go from hence to get in the harvest in Spain, and return with the best part of their earnings.

The whole country is subject to the parliament of Paris, but is governed by different laws; Lower Auvergne having a particular code of its own, while in Upper Auvergne the civil law takes place. This country is divided into five large districts, and two bailiwicks. Under its governor are two lieutenants-general and two sub-governors.

St. Flour, the capital of Upper Auvergne, stands on a mountain of difficult access. It is the see of a bishop whose diocese consists of two hundred and seventy parishes; he has a revenue of twelve thousand livres, and pays nine hundred florins to the court of Rome. Besides its cathedral, it has a collegiate church, and had a college of Jesuits. The inhabitants carry on a good trade in grain, this city being, as it were, the general magazine of the neighbouring country, which produces a great deal of rye. Its cloth, carpets, and knives, are also greatly esteemed.

Aurillac, a town which disputes the title and rank of capital with St. Flour, is seated in a valley on the banks of the river Jordane, two hundred and fifty miles to the south of Paris, and thirty to the south-west of St. Flour. It is pretty well built and populous; it also confers the title of count. Here is a district and bailiwick court; it has likewise a castle seated on a high rock, and a collegiate church, which is properly a secularized abbey, the abbot of which is lord of the town, and holds immediately of the pope. Here is also an abbey, and four convents. The Jesuits had also here a college. In this town are some manufactures of tapestry and lace.

Clermont, the ancient Augustonemetum, afterwards Auvergne, the capital of the whole country, stands on a small eminence in Lower Auvergne, between the rivers Artier and Bedat. It is the capital of the whole country, and is populous; but has very narrow streets, and the houses are dark. It contains a tax chamber, a bailiwick, and a county-court, &c. This was formerly the principal place belonging to the counts of Auvergne, who therefore styled themselves counts of Clermont. The bishop is first suffragan to the archbishop of Bourges; he is also lord of the small towns of Billon and Croupieres, and enjoys a diocese of eight hundred parishes, with a revenue of fifteen thousand livres, out of which he is taxed at the court of Rome four thousand five hundred and fifty florins. Besides its cathedral, it has three collegiate churches, and three abbeys; in that of St. Allier the bodies of several saints are said to be deposited. In the chapel of St. Venerand, and in that of St. André, are the tombs of the old counts of Clermont, and the dauphines of Auvergne. It has likewise many convents, and had a college of Jesuits.

In the neighbourhood of this city are wells where any substance laid in them soon contracts a stony crust. The most remarkable of these is that in the suburb of St. Allire, which has formed a famous stone bridge mentioned by many historians. This bridge is a solid rock, composed of several strata formed during the course of many years, by the running of the petrifying waters of this spring. It has no cavity or arches, till after above sixty paces in length, where the rivulet of Tiretaine forces its way through. This petrifying spring, which falls on a much higher ground than the bed of the rivulet, gradually leaves behind it some lapideous matter, and in process of time has thus formed an arch, through which the Tiretaine has a free passage. The necessity which this petrifying matter seemed to be under of forming itself into an arch, could continue no longer than the breadth of the rivulet, after which the water of the spring ran regularly under it, and there formed a new petrification resembling a pillar. The inhabitants of these parts, in order to lengthen this wonderful bridge, have diverted the brook out of its old channel, and made it pass close by the pillar, by which means they caused the spring to form a second arch, and thus they might have produced as many arches and pillars as they pleased; but the great resort of people to see this natural curiosity becoming troublesome to the Benedictines of the abbey of St. Allire, within whose jurisdiction the spring lies; in order to lessen its petrifying virtue, they divided the stream into several branches, which has so well answered their intent, that at present it only covers with a thin crust those bodies on which it falls perpendicularly. But in those over which it runs in its ordinary course, no traces of its petrifying qualities are any longer perceivable. It is the only water used for drinking in this suburb, and no bad effect is felt from it.

S E C T. XXI.

Of the two Governments of Limosin and La Marche ; their Situation, Extent, Climate, Produce, Rivers, and principal Towns.

LIMOSIN, or Limoufin, derives its name from the ancient Lemovices, and is bounded on the east by Auvergne ; on the south by Guienne ; on the west by Perigord in Guienne, and Angoumois ; and on the north by La Marche and Poitou. Its extent from north to south is about twenty-five French leagues, and from east to west somewhat less.

Upper Limosin is very mountainous, and consequently cold, but Lower Limosin is more temperate. The former produces but little wine, and that too but very indifferent, but that of Lower Limosin is extremely good. It produces such numbers of chesnut-trees, that the inhabitants derive their principal maintenance from them. The grain which grows here is rye, barley, and Turkish corn. They have also mines of copper, tin, iron, and lead, and in this country are some iron works.

Its chief rivers are the Vienne, the source of which lies in the borders of Lower Limosin and La Marche ; the Vezere, which rises in the same country ; the Coureze, which falls into the Vezere ; and the Dordogne, which divides Limosin from Auvergne, and the district of Quercy in Guienne.

The country is subject to the parliament of Bourdeaux, and besides its governor, has one lieutenant-general, and two sub-governors. The principal places it contains are ;

Limoges, in Latin Lemovicæ, the capital of the country, which is situated on the river Vienne, partly on a hill and partly in a valley, thirty leagues to the west of Clermont. The town is about a league and a half in circumference, but ill built, the houses being generally of wood, small, and dark ; but the cathedral is a magnificent structure ; besides which it has a collegiate church, three abbeys, one convent, and a college and seminary, which lately belonged to the Jesuits. It contains a bailiwick, a country and royal court, with other public offices, and also a mint. Its bishop is suffragan to the archbishop of Bourges, and his diocese, which extends over Upper and part of Lower Limosin, La Marche, and a part also of Angoumois, contains nine hundred parishes ; and his revenue amounts to twenty thousand livres, out of which he pays sixteen hundred florins to the court of Rome.

Tulle, properly Tuelle, is a town situated in Lower Limosin, near the confluence of the little rivers Coureze and Solane, fifteen leagues to the south of Limoges, and a mile and a half in circumference. It contains about twelve hundred houses, and five thousand people. Its bishop, who is lord and viscount of the town, is suffragan to the archbishop of Bourges ; and his diocese, which consists of seventy parishes, brings him in a revenue of twelve thousand livres, out of which he pays to the court of Rome fourteen hundred florins. It has six convents and had a college of Jesuits.

Brive la Gaillarde is seated near the confluence of the Coureze and Vegere, seventeen leagues to the south of Limoges, and five to the west of Tulle, in a valley environed with little hills planted with vines and chesnut-trees ; the situation being extremely beautiful. It is the only fine town of the province : the houses are elegantly built, and the walls about it extremely pleasant. In this little town are found all the pleasures and conveniences of life. It contains about a thousand houses and five thousand persons.

The government of La Marche is bounded on the north by Berry ; on the east by Auvergne ; on the south by Limosin ; and on the west by Poitou ; it being about twenty-two French leagues in length from north to south, and eight in breadth from east to west.

It is, like Limosin, divided into Upper and Lower, and the soil and climate are both the same. Its principal rivers are the Vienne ; the great and little Creuse, which discharge themselves into the Vienne ; the Cher, and the Gartempe, the latter of which falls into the

Creuse. The upper parts of the district are pretty fruitful in corn.

This province contains two bailiwicks, and is governed by its own laws. Subordinate to its governor, is one lieutenant-general, and two sub-governors.

Gueret, the capital of the Upper and Lower Marche, is seated on the river Gartempe, ten leagues to the north-east of Limoges, and is the place where the courts of justice are held ; but it has only one parish church, one college, one priory, two convents, and an hospital. The other places in this government are equally inconsiderable.

S E C T. XXII.

Of the Government of Saintonge and Angoumois ; their Situation, Extent, Produce, Rivers, and principal Cities.

SAIN TONGE is bounded by Poitou and Aunis on the north ; by Angoumois and Perigord on the east ; by Guienne and the river Gironde on the south ; and by the Bay of Biscay on the west ; extending twenty-five leagues in length, and twelve in breadth. It derives its name from the Santoni, the ancient inhabitants.

This country abounds in corn, wine, and all kinds of fruit ; and the inhabitants, who are situated near the sea, make great quantities of excellent salt. Its horses are also much esteemed. In it are some mineral springs. Its principal rivers are the Charente, which abounds in fish ; it rises near Charennac, and runs into the sea ; and the Butonne, which rises in Poitou, and falls into the Charente.

This country is divided by the Charente into the south, or Upper Saintonge, and into the north part, or Lower Saintonge. It is subject to the parliament of Bourdeaux, a few parishes excepted, which are within the jurisdiction of Angoumois. The governor-general is also deputy-governor of this country. The principal places in Upper Saintonge are,

Saintes, the capital, which is seated on the Charente, fifty-eight miles to the northward of Bourdeaux, and twenty to the east of the Bay of Biscay. It is a little ill-built city ; but contains a provincial and a bailiwick court, with other public offices, and is the see of a bishop, suffragan to the archbishop of Bourdeaux. His diocese contains five hundred and sixty-five parishes and chapels, and his revenue amounts to twenty thousand livres, out of which his Roman tax is two thousand florins. The streets are narrow and mean, but in the suburbs is an abbey, and the Jesuits had here a college. Some ancient ruins discover its antiquity, as a triumphal arch supposed to be erected in the reign of Tiberius, the ruins of an amphitheatre, of several aqueducts, and a capitol.

Pons, a handsome town, stands high on the little river Seigne, over which it has several bridges, whence it probably received its name. It is divided into the Upper and Lower, and contains three parish-churches, three convents, three alms-houses, and a commandery of the knights of Malta.

St. John d'Angeli, in Latin Angeliacum, stands on the river Butonne, five leagues to the north-east of Saintes, and has a royal court of justice. While this place continued in the possession of the Protestants, it was populous and well fortified ; but being reduced in 1621 by Lewis XIII. the fortifications were razed, and the city deprived of its privileges. It has an abbey and three convents. Its brandy is much esteemed, and the inhabitants also make woollen stuffs.

Angoumois is bounded by Poitou on the north, by Limosin on the east, by Perigord on the south, and by Saintonge on the west ; it being between fifteen and sixteen French leagues in length, and about sixteen in breadth.

The country is full of little hills, and has none of any considerable size. It produces wheat, rye, barley, Spanish corn, oats, saffron, wine, and fruit : it also yields some excellent mines of iron, and is particularly famous for making of paper. Its principal rivers are the Charente and Touvre, the latter of which rises here, and runs into the former.

This country is subject to the parliament of Paris, and con-

contains a bailiwick and territorial jurisdiction. In it are the following places :

Angoulême, the capital of Angoumois, is seated on the top of a hill surrounded with rocks, at the foot of which runs the river Charente, thirty miles to the eastward of Saintes. It confers the title of duke, is the see of a bishop, and has a bailiwick, a country and forest court, an office of the five great farms, &c. and is said to contain eight thousand persons. Its bishop is suffragan to the archbishop of Bourdeaux, and has a diocese of two hundred parishes, with a revenue of twenty thousand livres, out of which he is taxed by the court of Rome a thousand florins. Here are twelve parish-churches, and the abbey of St. Cibard, in which lie buried the old counts of Angoumois ; together with ten convents, a college which lately belonged to the Jesuits, and a general hospital.

Coignac, or Cognac, the second town of the country, stands seven leagues to the westward of Angoulême, in a most delightful situation on the Charente. It has a castle, in which Francis I. was born, and three convents ; but it is better known to us by its excellent wine and brandy.

S E C T. XXIII.

Of the two Governments of Nivernois and Bourbonnois ; their Situation, Extent, Rivers, Produce, Government, and principal Towns.

THE government of Nivernois is bounded on the north by Burgundy and the Gatinois, on the east by Burgundy, on the south by Bourbonnois, and on the west by Berry. Its figure is pretty nearly circular, and it is about twenty leagues over either way.

It produces corn, wine, and fruit ; except in the district of Morvant, which is a mountainous country, that produces scarce corn enough for the subsistence of the inhabitants. It has large woods, some pit-coal, and mines of iron. Among the many rivers which water Nivernois, three of them are navigable ; these are the Loire, which runs from south to north along the western borders of this country ; the Allier, which runs into the Loire ; and the Yonne, which rises on the south-east part of this province, and running northward falls into the sea. The other streams serve to render the country fruitful and pleasant : there are here also some mineral springs.

This country is subject to the parliament of Paris, and has its own particular laws. Over it is a governor, a lieutenant-general, and a deputy-governor. It is divided into eight districts, the principal places in which are the following :

Nevers, the ancient Noviodunum, and afterwards Nivernum, is situated in the district called Le Vaux de Nevers, and is the capital of the country. It is built in the form of an amphitheatre on the banks of the Loire, which is here joined by the little river Nievre, thirty leagues to the south-east of Orleans. It has a handsome stone bridge of twenty arches ; but the streets are narrow, and the ground uneven. The cathedral, dedicated to St. Cyr, is a fine structure ; besides which there are eleven parish-churches, two abbeys, several convents, and the Jesuits had here a college. It is computed that the inhabitants amount to about eight thousand. Among the other buildings is an old castle, which fronts a large square that consists of handsome houses uniformly built. There are here a forest and a bailiwick court, with a salt-office. The bishop is suffragan to the archbishop of Sens, and his diocese consists of two hundred and seventy-one parishes. His revenue amounts to twenty thousand livres, and he pays twelve hundred and fifty florins to the court of Rome. This place is celebrated for its porcelain and glass-houses, and for its works in enamel. The inhabitants also carry on a great trade in corn, hemp, wood, pit-coal, iron, and tin-wares. The fields about the town are extremely pleasant, particularly the public walks in the adjoining park.

Clamecy, a town seated in a district called the Vale of Yonne, and upon the banks of that river, which is

here joined by the Buvron, and rendered navigable. In it is a castellany, and a salt-office. Pantenor, one of its suburbs, stands on the other side of the Yonne, and in the year 1180 was the residence of the bishop of Bethlehem, who had been compelled to leave Palestine. The bishop of the city, who still styles himself bishop of Bethlehem, is created by the count de Nevers, and enjoys all the privileges of the other French bishops, though his revenue amounts to no more than a thousand livres, and this town is his whole diocese.

The government of Bourbonnois is bounded on the north by Nivernois and Berry, on the east by the duchy of Burgundy, on the south by Auvergne, and on the west by Upper Marche. It is about thirty French leagues in length, and twenty in breadth.

It is pretty fertile, particularly in corn, fruit, and forage : it also produces good wine, though not in a sufficient quantity for exportation. It has likewise a few coal-pits, and a great number of mineral springs and warm baths. Its rivers are the Loire, the Allire, the Cher, with some other smaller ones. In July, when the snow melts on the mountains of Auvergne, great damages are done by the inundations of the Allire.

This country is subject to the parliament of Paris ; though the duke of Bourbon, to whom it belongs, has the nomination of all civil officers, yet their proper master is the king. Besides the governor and lieutenant general, here are also two sub-governors ; and in the whole country are twenty-two small towns, the principal of which are,

Moulins, in Latin Molinæ, the capital of the country, is seated on the Allire, in a pleasant fertile plain, almost in the middle of France, thirty miles to the south of Nevers, and fifty-five to the north of Clermont. It is well built, and one of the most agreeable places in the kingdom. It contains an intendency, a chamber of domains, a castellany, and several courts. It has likewise a collegiate church, five convents, an hospital, and a college, which lately belonged to the Jesuits.

Bourbon l'Archambaud, a small town fifteen miles to the west of Moulins, environed by four hills, on one of which stands an old castle that contains three chapels, among which that called the Holy is very splendid. In this town are a royal castellany, and a district court. There are here also one parish and one collegiate church, a priory, a convent, and two hospitals. This town is famous for its hot baths and cold mineral springs.

S E C T. XXIV.

Of the Governments of Berri and Touraine ; their Situation, Extent, Produce, Rivers, Government, and principal Towns.

THE country of Berri is bounded on the north by the Orleanois, on the east by the Nivernois, on the south by the Bourbonnois and La Marche, and on the west by La Marche and Touraine. Its extent from east to west is between twenty-seven and twenty-eight French leagues, and from north to south between thirty-five and thirty-six.

The air here is temperate, and the soil produces wheat, rye, and wine ; and in some places it is equal to that of Burgundy. Its other products are also good, particularly its hemp and flax, in which it abounds ; and its rich pastures feed great numbers of cattle, especially sheep, which are valued for the fineness of their wool. In one place in this country is found oker, which is seldom met with in France.

The principal rivers here are the Loire, the Creuse, and the Cher ; the large and lesser Sandre, the Nerre, and the Indre ; these two last have their sources in this country : the Orron, the Aurette, the Moulon, and the Evre. In this country is also the lake of Villiers, which is between seven and eight leagues in circuit.

Berry is under the jurisdiction of the parliament of Paris, and is governed by laws of its own. Subordinate to the governor are one lieutenant-general and two sub-governors, and it is divided into Upper and Lower Berry, the principal places in which are the following :

Bourges, the capital of Upper Berry, and of the whole country, is situated on a hill between the rivers Evre and Orron, to the banks of which it gradually descends, thirty-five leagues to the south of Paris, and seventeen almost south-east of Orleans. These two rivers encompass it on every side, except on that next the gate of Bourbonnoux. It is a large spacious city, containing a cathedral, four collegiate churches, besides two annexed to the seminary, four abbeys, and sixteen parish-churches, with a beautiful and large college, which lately belonged to the Jesuits. You meet here with many ecclesiastics, gentlemen, and scholars; and it is computed that there are in this city about fifteen thousand souls; but not many of them are tradesmen; the place having no other trade than what is necessary for the subsistence of the inhabitants. It is the see of an archbishop, and has an intendency, a salt-office, an independent royal tribunal, and several other offices and courts. The cathedral, which is dedicated to St. Stephen, is a fine Gothic structure standing on the highest part of the city: the archbishop, who is styled patriarch and primate of Aquitaine, has five suffragans, with a diocese of nine hundred parishes, and a revenue of thirty thousand livres, out of which he pays four thousand and thirty-three florins to the court of Rome.

The palace built by prince John of France, duke of Berry, is a magnificent edifice, in one part of which, called the king's apartment, the governor resides, and the other serves for the courts of justice; the great hall in the latter, which has no pillars to support it, is esteemed one of the finest and largest rooms in the kingdom. The town-house, erected by Jaques Coeur, is one of the most elegant buildings ever erected by a private man, and was purchased by Colbert, prime-minister of France, who gave it to the corporation of this city. The square of Bourbon is the largest in Bourges, and here antiently stood a Roman amphitheatre. The public walks and the malls are much admired, and the great number of religious houses are another considerable ornament to the city. The university of Bourges was either founded or revived in the year 1463, and consists of four faculties.

Cæsar took Bourges by storm; and the inhabitants having exercised some cruelties on the Roman soldiers that had fallen into their hands, he glutted his revenge by destroying near forty thousand of the natives. In the fifteenth century Charles VII. made this the place of his residence, while the English were masters of almost all the rest of the kingdom; on which occasion the English called him, by way of derision, king of Berry.

Issoudun, in Latin Exolidunum, a large town, the second in rank in the province, stands in a beautiful plain seventeen miles to the south-west of Bourges, and is the principal place in Lower Berry. It contains a salt-office, a manor court, and other public courts and offices. It is divided into the Upper and Lower Town, and has a castle, which commands the place: it has also one abbey, two collegiate and four parish-churches, five convents, and two hospitals.

The province of Touraine, which derives its name from the Turones, is bounded on the north by the river Maine, on the east by the Orleanois, on the south by Berry and Poitou, and on the west by Anjou. Its greatest extent from east to west is twenty-two French leagues, and from north to south twenty-four.

The air is temperate, and the country so delightful, that it is called the Garden of France; but it is not every where alike. The tract called the Varennes, which lies along the Loire, has a sandy soil, which produces rye, barley, millet, garden plants, and an herb which makes a good yellow dye. That called the Verron is richer, and yields corn, wine, very fine fruit, and particularly large plums. La Champagne is a small strip of land between the rivers Cher and Indre, abounding in grain, and particularly wheat. La Brenne is a swampy country: but the eminences along the Loire and Cher are covered with vineyards. In short, La Gastine is a stiff land very difficult to plough; and the country of Noyers is distinguished by its having some mines of iron, and one of copper.

This country is governed by laws of its own; but the inhabitants have a right of appeal to the parliament of

Paris. It has a governor, a lieutenant-general, and a sub-governor. There are twenty-seven towns or boroughs in the country; the principal places of which are the following:

Tours, the Cæsarodunum, or Turoni, of the ancients, and the capital of the country, lies in a plain extending between the river Loire and the Cher, and is fifty-two miles to the north-east of Poitiers, and a hundred and twenty-seven to the south-west of Paris. The city is large and well built, and the streets very clean, on account of several rivulets running through them from six public fountains. In this city is a very fine mall above a thousand paces in length, and adorned on each side with two rows of fine elms. The inhabitants are so scrupulous, that after it has rained no person is suffered to play, nor even walk in it till it be dry, under a penalty of ten livres. This city has a mint, a receiver's office, and a salt-office, an intendency, a provincial, bailiwick, and forest court. The cathedral is a fine structure, with two lofty towers, a curious clock, and a library, where are seen several antient manuscripts fastened by chains upon desks. The two most valuable of these manuscripts are, one of the Pentateuch, written in small capitals, which is reckoned to be a thousand years old; and another of the four Gospels, in Saxon characters, which some think to be of the same age as the Pentateuch, and others twelve hundred years old. There are here also five collegiate churches, three abbeys, twelve convents, and the Jesuits had here a college. The city is the see of an archbishop, under whom are eleven suffragans, seventeen abbeys, twelve collegiate churches, ninety-eight priories, three hundred parishes, and a hundred and ninety-one chapels. His revenue is forty thousand livres, and he pays to the court of Rome nine thousand five hundred florins. Here is also a royal palace, and an academy of polite literature.

While the manufactures of gold, silver, and silk brocades were in a flourishing condition, this city was computed to contain sixty thousand inhabitants, which number is reduced to thirty thousand. The city is governed by a mayor and twelve echevins.

Amboise, in Latin Ambacia, or Ambasia, is seated at the confluence of the Loire and the Amasse, twelve miles to the eastward of Tours, and contains a salt office, and a royal and forest court. In it are two parish-churches, four convents, and one hospital. Near the town is a large castle standing on a high rock, in which are the statues of Charles VIII. and his consort Anne; as also a stag's head of very extraordinary dimensions, it being ten feet high and eight feet broad, from the extremity of one horn to the other. This was supposed to be natural, till it was at last discovered to be factitious, and only made of wood. There are here also several other curiosities. In this town Charles VIII. was slain, either by running against a door, or, according to others, by being shot through the head. This was also the place where the civil war in 1561 first broke out, and where the name of Huguenot had its rise.

S E C T. XXV.

Of the two Governments of Poitou and Aunis; their Situation, Extent, Produce, Rivers, and principal Cities; with a more particular Description of Poitiers and Rochelle.

THE province of Poitou is bounded on the north by Touraine and Anjou, on the east by La Marche and part of Berri, on the south by Angoumois and Aunis, and on the west by the Bay of Biscay. It extends from north to south twenty-two French leagues, and from east to west forty-eight. It received its name from the antient Pictavi, or Pictoni.

The country is diversified with champaign lands, woods, and pasture grounds, with a few forests. The soil is various, according to the different parts of the country; but it in general abounds in corn and cattle. The principal trade of the inhabitants consists in oxen, mules, horses, and woollen stuffs.

The largest rivers are the Vienne, which rises on the borders of Limosin, and being joined by the Creuse falls into the Loire; the Sevre Niortoise, which rises in this country,

country, and, after receiving the Venotee, discharges itself into the sea; these are all navigable: here is also the Clain, which rises in the frontiers of Angoumois and falls into the Vienne.

This province was erected into an earldom by Charlemagne. Eleanor, daughter to the last duke of Aquitaine, brought it to her spouse Henry II. king of England, to which it continued subject, with some interruptions, till the unfortunate reign of Henry VI. when it was taken in 1436, since which time it has been perpetually annexed to the crown of France. It is subject to the parliament of Paris, and has but one provincial court. Under the governor is a lieutenant-general, and two deputy-governors.

This province is divided into two parts. Upper Poitou, which constitutes the eastern part of the country, is larger, more fruitful, pleasant, and healthy, than the Lower; we shall begin with the former, the principal places in which are the following:

Poitiers, or Poictiers, in Latin Augustoritum, the capital of the country, is seated upon a hill on the left bank of the little river Clain, into which falls another rivulet. It lies about eighteen leagues to the east of the sea coast, and seventy miles to the north-east of Rochelle. Were its circuit to be only considered, it would, perhaps, be esteemed the first in the kingdom, next to Paris; but it is far from being peopled in proportion to its extent, there being corn-fields and meadows within the walls; for the city has been so reduced by the civil wars, that it is almost become a desert, and is a mean smoky place. It is, however, a seat of a seneschalship, a presidial court, an office of the finances, and a country court. It is the see of a bishop, who is suffragan to the archbishop of Bourdeaux, and has a diocese of seven hundred and twenty-two parishes, with a revenue of twenty-two thousand livres, out of which he pays to the court of Rome two thousand eight hundred florins. The cathedral is of an uncommon size, and built in the Gothic style. In this city are also four collegiate churches, seventeen other parish-churches, four abbeys, twenty-one convents, and two seminaries; the Jesuits had also a college here. An university was founded in 1431, and there are likewise three hospitals. In 1687 the inhabitants erected in the Royal square a pedestrian statue of Lewis XIV. The inhabitants in this town are principally employed in making gloves and combs; they also export woollen caps and stockings.

There are here some remains of Roman antiquities; among these is an amphitheatre, which lies among gardens and small houses, a triumphal arch, or rather gate, erected at the beginning of a military way, of which nothing at present remains but the arch, with the two pillars which support it. The palace and thick round tower close by it are said to be Roman works; but they carry evident traces of their being of Gothic structure.

In the neighbourhood of this city Edward the Black Prince obtained a memorable victory over the French, in the year 1356, at which he took John their king, with his son Philip, prisoners.

Niort is the best trading town in the province; it is seated on the river Soure, and has a bailiwick, a royal jurisdiction, and a forest court. It contains a castle, two parish churches, and nine convents, a general hospital, and has some manufactures of wool.

Luçon, a city in Lower Poitou, is seated in a morass twenty-three leagues to the south-west of Poitiers, and enjoys the title of a barony. It is the see of a bishop, who is lord and baron of the town, and suffragan to the archbishop of Bourdeaux. His diocese consists of two hundred and thirty parishes, and he has a revenue of twenty thousand livres, out of which he pays to the court of Rome one thousand florins. The air of this place is unwholesome, and, besides the cathedral, it contains only one parish church, one seminary, and two convents.

The government of Aunis is bounded on the north and west by Poitou; on the south by Saintonge; and on the west by the Bay of Biscay. It is watered by the Soure, which rises in Poitou, and there are good harbours along the coast. The country is somewhat barren, but produces some corn, and a great deal of wine; the marshes afford good pasturage.

This little province depends on the parliament of Paris, but is partly governed by its own common law, founded on custom. Under the governor is a lieutenant-general and a deputy-governor.

Rochefort, a new regular built town, seated on the river Charente, twenty-three miles to the south of Rochelle; it was formerly a small village belonging to a private family, from whom Lewis XIV. bought it in 1664, in order to build a city here; for it having been observed, that from this place to the sea, which is about four miles distant, the river was large enough to carry the biggest ships, the bottom excellent for anchorage, and the banks very even and solid; it was resolved to erect this city, and this resolution was accordingly executed. It has a very commodious harbour, and is one of the stations for the royal navy of France; so that here are all the necessary magazines for shipping, and a spacious and convenient dock. Here are also a victualling warehouse, a foundery, a manufactory of sail-cloth, the Hôtel called Cazernes, which was originally used for the education of three hundred gentlemen of noble families, designed to serve in the navy, and who are taught at the king's expence; but it now serves to lodge the marines, and is an hospital for sick soldiers, &c.

The entrance of the river is well defended by several forts, particularly one in the Isle of Aix, the redoubt facing it called Aiguille, fort Fourax, de la Pointe, and Vergeron; and about a league below Rochefort, is a long stoccado across the river. On the twenty-first of Sept. 1757, the Isle of Aix, with the fort upon it, was taken by the brave captain Howe, in the *Magnanime*, after about an hour's resistance, when the whole garrison, which consisted of near six hundred men, were made prisoners of war.

Rochelle, in Latin Rupelle, the capital of the province and government, in forty-six degrees sixteen minutes north latitude, and one degree ten minutes west longitude, is seated on the sea. It has a good harbour, but is rather handsome than large. The city has broad and straight streets, with neat houses, supported by piazzas and porticos, which afford shelter both from the rain and sun. It is the see of a bishop, suffragan to the archbishop of Bourdeaux, with a diocese of one hundred and eighty parishes, and a revenue of seventeen thousand livres, out of which he is taxed by the court of Rome seven hundred and forty-two florins. Here is also an intendency, a provincial and a bailiwick court, an admiralty, a chamber of commerce, and a mint. The Jesuits had also a college here; and there is likewise a college of physic, anatomy, and botany, for the instruction of young surgeons and apothecaries.

Rochelle was the principal seat of the reformed in France, whose inhabitants embracing Calvinism in the sixteenth century, suffered extremely during the civil wars, and having been fortified by them, was frequently defended with the utmost bravery. It was long possessed by that body, till at length Lewis XIII. after a long and famous siege, made himself master of it in 1628, chiefly for want of the promised succours from England, which did not arrive in time, and by means of an admirable bank of earth that cardinal Richelieu caused to be raised against it on the side of the ocean, to prevent their receiving succours. Famine at length obliged them to capitulate, in consequence of which their privileges were taken from them, and the fortifications demolished, except only two towers that defend the port; but his son Lewis XIV. caused new and very strong fortifications to be raised round it. The port is almost of a circular figure, and near fifteen hundred paces in circuit. One of the above-mentioned towers defending the port, is a prison for state criminals, and the other is called the Tower of the Chain. No vessel can enter into the harbour without leave of the governor, or captain of this last tower.

The principal manufacture carried on here is the refining of sugar; and they have lately set up a manufacture of earthen ware which succeeds very well. A considerable trade is carried on here to the islands of America, to which all the necessaries of life are sent, and from thence the vessels employed in it bring back the produce of those countries. The English in time of peace, with the Dutch, Danes, and the Swedes, annually send to

Rochelle

Rochelle a great number of ships, in order to take wine, brandy, salt, paper, linen, cloth, and serges.

The isle of Ré, in Latin Radis, lies between two and three French leagues from the Continent, and is four miles in length, and two in breadth. It produces plenty of wine, of which is made a very fine sort of brandy, and is very populous. It has a little fortified town, named St. Martin, which has a harbour and citadel, and is likewise defended by three other forts.

The isle of Oleron, in Latin Uliarus, is about three French leagues distant from the main land; it is five in length, two in breadth, and extremely fruitful. The inhabitants here having been able and expert sailors for these six or seven hundred years past, have drawn up rules for the marine, called the Laws of Oleron, which have served as a model to other maritime powers with regard to sea affairs. These islanders have always enjoyed very considerable privileges, both under the dukes of Aquitaine, and the kings of France, and had a governor peculiar to themselves, who had a very extensive authority. This island, together with that of Ré, was taken in the sixteenth century by the citizens of Rochelle; and as these islanders were very well affected to them, on account of the reformed religion, which most of them professed, they continued masters of these islands till the year 1625, at which time Lewis XIII. took them again.

S E C T. XXVI.

Of the two Governments of Anjou and Saumur; their Situation and Extent; with a Description of Angers and Saumur.

THE government of Anjou, which received its name from the ancient Andes, or Andegavi, is bounded on the north by the river Maine; on the east by Touraine; on the south by Poitou; and on the west by Brittany. Its greatest length from east to west is twenty-six French leagues, and from north to south twenty-four.

The country is a pleasant succession of hills and valleys, producing corn, wine, pease, beans, flax, hemp, and fruit-trees. Its fine pastures also furnish great herds of cattle. It has likewise mines of coal, iron, and salt-petre, together with quantities of marble, stone, and slate.

In this country are reckoned no less than forty-nine great and small rivers; but only six of these are navigable. These are the Loire, the Vienne, the Toue, the Magenne, the Loir, and the Sarthe. This country is under the parliament of Paris, but has laws of its own. Subordinate to the governor, is one lieutenant-general, and two sub-governors. The principal city in this government is

Angers, anciently Juliomagus, and in Latin Andegavum, the capital of the country, lies a little above the place where the rivers Loire and Sarthe fall into the Mayenne, which divides the city into two equal parts. The first walls were raised by John, surnamed Lackland, king of England and duke of Anjou; but prince Lewis, afterwards king Lewis VIII. son of Philip Augustus, caused those walls to be demolished; however, St. Lewis his son and successor rebuilt them as they now are. This is a large and populous city, containing nine thousand houses, and about thirty thousand inhabitants; it has sixteen parishes, twelve of which are within the town, and four in the suburbs. Here are likewise eight collegiate churches, and a great number of convents both of men and women. This city is the see of a bishop, who is suffragan to the archbishop of Tours. His diocese contains six hundred and sixty-eight parishes; his revenue amounts to twenty-six thousand livres, and his taxation at the court of Rome is seventeen hundred florins. The cathedral is remarkable for three very high steeples built on its portico, of which that in the middle rests upon the foundations of the two others. Its roof is very high; large, and bold; it is not supported by any pillars; and the whole structure is in general elegant. Part of the town stands very low; so that it is proverbially said in the neighbouring country, "that Angers is a low town, " has high steeples, rich strumpets, and poor scholars."

It has a strong castle built on a rock, and encompassed with ditches cut into it, though very steep on the side of the river which runs at its foot. This castle is flanked with several large towers, and has a half-moon at the gate which leads to the suburbs. It was built by St. Lewis during the wars with the English, and it now serves as a prison for state criminals.

The university, which is one of the most famous in France, was founded by St. Lewis. They teach here the civil and canon-law, divinity, physic, and the liberal arts. A chair for a professor of the mathematics has been lately erected here, in the college of the fathers of the Oratory. Lewis XIV. in 1615, established in this city a royal academy, with the same privileges as that of Paris: it consists of thirty-six members, who must all be natives or inhabitants of the province. Here is a great procession annually celebrated at a festival called la Fête du Dieu, which is on Corpus Christi day, when all the priests and monks, with the principal inhabitants, and numbers of strangers, carry lighted torches in their hands, and representations of Scripture histories engraved, to atone for the pretended crime of their archdeacon Berengarius, who opposed transubstantiation about the year 1019, when that doctrine was first preached here.

This city is under the government of a mayor and four aldermen, annually chosen; twelve counsellors, eight assessors, a city attorney, a commissary, and a recorder. Their jurisdiction extends over the manufactories set up in the town, suburbs, and liberty. These manufactures consist of fine woollen stuffs, striped with silk and gold. They also bleach wax and linen cloth. In the town are likewise some sugar-bakers.

The Saumurois, or government of Saumur, contains a part of Anjou and Upper Poitou: it is under the direction of a governor, a lieutenant-general, and a sub-governor. The principal place it contains is

Saumur, in Latin Salmurus, the capital, and the seat of the public courts and offices, stands twenty-two miles to the south-east of Angers, and a hundred and sixty to the south-west of Paris. It contains a fine castle, three parish-churches, nine convents, and one royal college. Here is an important passage over the Loir, upon which there is a famous bridge. This city was much more opulent while in the possession of the Protestants; but has still an university. Near it is the magnificent abbey of the Benedictines of the congregation of St. Maur.

S E C T. XXVII.

Of the Government of Orleanois; its Situation, Extent, Divisions, Rivers, Canals, and principal Cities.

THE government of Orleanois consists of several small countries, and is bounded on the north by Normandy and the Isle of France; on the east by the Isle of France, Champagne, and Burgundy; on the south by Nivernois and Berry; and on the west by Touraine and Maine; including Orleanois Proper, Sologne, Beaulle Proper, or Chartraine, Dunois, Vendomois, Blaisois, the greatest part of Gatinois, and Perche Gouet. The whole government extends about thirty-two leagues in length from east to west, and twenty-eight in breadth from north to south.

The rivers which run through this government, or have their source in it, are the Loire; the Loiret, which rises a league from Orleans, and falls into the Loire; the Cher, which also runs into the Loire; the Laconie, which rises in the wood of Orleans, and loses itself in the same river; the Aigle, which rises in this government, and also mingles with the Loire; the Hyere, which loses itself under ground, and, when it afterwards appears again near Montigny, is called le Ganelon, falls into the same river.

In this district are likewise some remarkable canals. That of Briare, which receives its name from a small town, joins the river Loire to the Loing, which falls into the Seine, and consequently opens a communication between the countries lying on the Loire and the city of Paris. The canal of Orleans also joins the above-men-

tioned rivers; this canal, which was begun in 1682, and finished in 1692, is near eighteen leagues in length, and contains thirty sluices.

The whole government is subject to the parliament of Paris, and contains four large and three small jurisdictions. The trade carried on here by means of the Loire is the most extensive in the whole kingdom, comprehending not only all that comes from the southern and western parts, but likewise from foreign countries. The principal staple is at Orleans. Under the governor are three lieutenant-generals, and three sub-governors.

Orleanois Proper is one of the finest countries in France; it being fertile in corn, wine, and excellent fruit; and abounding in cattle, game, and fish. The principal places in this government are the following:

Orleans, antiently Genabum, or Cenabum, and afterwards Aurelianum and Aureliana, the capital of the government, is seated on the Loire, over which it has a fine stone bridge of sixteen arches, leading to a suburb on the south side of the river. On this bridge is to be seen a beautiful monument of cast brass standing on a stone pedestal, that has some ornaments in the Gothic taste. In the center of the monument is a crucifix, on the top of which stands a pelican with its brood pecking its own breast; before the crucifix is the Virgin Mary sitting with the dead body of Christ reclined on her lap. On the right side is king Charles VII. kneeling and stretching out both his hands towards the cross, and on the left side the famous maid of Orleans, also represented kneeling, both armed cap-a-pie with swords by their sides; the king has the French coat of arms, and wears a crown on his helmet. But the helmet of the maid is placed by her: her hair is tied behind, and the rest of it hangs loose on her back. These statues are not so big as the life. A solemn procession is annually observed here on the twelfth of May, in commemoration of the deliverance of the city. It stands in a most agreeable plain, and is built in the form of a bow; the streets in general are narrow, but some of them are broad and straight. This city, which is about four miles in circuit, is but meanly built, and, except a few of the tradesmen, the inhabitants are poor. It is the see of a bishop, and contains an intendency, a castellany, a country court, a forest court, a salt-office, and other courts and offices. It has a fine cathedral built in the Gothic style, an abbey, three collegiate churches, twenty-two parish-churches, an university consisting only of civilians, which was formerly very famous, though it is at present in no great repute, one seminary in which divinity is taught, and a public library. The Jesuits had also a college here. Its bishop, who is subordinate to the archbishop of Paris, has a diocese of two hundred and seventy-two parishes, and a revenue of twenty-four thousand livres, out of which he pays two thousand florins to the court of Rome. The public walk is properly a part of the city ramparts, levelled and planted with beautiful rows of trees. The suburb on the farther side of the river makes a tolerable appearance, and has a Carthusian monastery. This city, on account of its situation in the middle of the Loire, is the magazine of the whole trade of the kingdom, especially in corn, wine, brandy, and spices: it also carries on a considerable trade in sheep-skins, and likewise in stockings, of which great quantities are made here.

In the year 1344 it was raised to a dukedom and peerage, and Lewis XIV. gave it his brother Philip, in which house it continues.

This city was besieged by the English in 1428, and so straitened, that the inhabitants resolved to surrender to the duke of Burgundy, then in the English army, and their ally. But the English not being willing that the city should be given up to him, he was disgusted at it, and Joan of Arc heading the soldiers, raised the siege in 1429, from which she obtained the name of the Maid of Orleans. The French language is spoken here in the greatest purity.

The forest of Orleans lies to the north of the city and of the river Loire, and is the largest in the whole kingdom. It contains about fourteen thousand acres planted with wood; but is interspersed with several plains and villages. It is twenty leagues, or sixty miles, in length, and in some places seven or eight leagues, and in others

only two or three in breadth. It contains high and lofty trees, as oaks, elms, &c. In this forest they fell timber every year to the value of a hundred thousand livres, the profits of which belong to the duke of Orleans.

Chartres, the Autricum of the antients, is the capital of the country of Chartrain; it is situated on the river Eure, about fourteen leagues to the south-west of Paris, and is divided into two parts by the above river, the largest of which stands on an eminence. It is the see of a bishop, and has a noble cathedral; but the city has little beauty to recommend it, the streets being narrow, and the buildings old. It has three abbies, one priory, six parish-churches, without including those in the suburbs, nine convents, one seminary, and two hospitals. In the city are also held a provincial and bailiwick court, together with a salt office. The bishop, who is suffragan to the archbishop of Paris, has a diocese of eight hundred and ten parishes; his annual revenue amounts to twenty-five thousand livres, out of which he pays four thousand florins to the court of Rome.

Blois, in Latin Blesæ, the capital of the district of Blaisois, stands partly on an eminence, and partly in a plain on the river Loire, over which it has a well-built stone bridge. It is situated ten leagues to the south-west of Orleans, in a pure air, and in the midst of one of the finest countries in France. It is a large handsome city; but the greatest beauty of it is the palace, or castle, the residence of several of their kings, with gardens adorned with fountains and other water-works, and a park suitable to the magnificence of the buildings. The staircase of the palace is much admired, as well as the gallery, which is said to be six hundred feet long; and over the great gate is a statue of Lewis XII. In the grand court before the palace stands one of the largest collegiate churches in France. It is remarkable that there is an image of the Virgin over every gate of the city; these were set up in 1631, when, after having suffered much by the plague, they imagined, on its ceasing, that they were miraculously delivered by the queen of heaven, as they stile her. The parish-church of St. Solenne, the largest in Blois, having been destroyed by a tempest, was magnificently rebuilt by Lewis XIV. and converted into a cathedral. The Jesuits had also a beautiful college here, the front of which is adorned with the Doric, the Ionic, and the Corinthian orders of architecture. The other public edifices, as the town-house, and the building where the courts of justice are held, are well worth viewing. Their fountains are also large, and well supplied by a noble aqueduct, supposed to be the work of the ancient Romans.

The bishop, who is suffragan to the archbishop of Paris, has in his diocese about two hundred parishes, and his revenue amounts annually to twenty thousand livres, out of which he is taxed two thousand five hundred and thirty-three florins at the court of Rome. There are here several churches besides those we have mentioned, and likewise a considerable number of convents.

The natives are represented as being remarkable for their good sense and gentle behaviour, as well as their speaking French in perfection, which is supposed to proceed from the frequent residence of the court in this city.

The principal trade here is in wine and brandy, which are sent to Orleans, Paris, Tours, Laval, and even into Holland; and the city is also distinguished for making the best watches in the kingdom.

Chambord, a royal palace seated in a wood on the river Cosson, is a magnificent edifice of free-stone, built by Francis I. It is said to exceed any Gothic edifice in France, and to have such various beauties, that the greatest masters may learn something from it. The body of the building is composed of four large pavilions, and the whole is surrounded with a wall of hewn-stone, flanked with towers, which at a distance give it a magnificent appearance. The tower over the center looks very grand, and the principal winding stair-case is much admired. The halls, anti-chamber, chambers, wardrobes, cabinets, and galleries, are of exquisite architecture, and the garden and park answerable to the beauty of the building. In this palace Stanislaus, the dethroned king of Poland, resided nine years. It was afterwards con-

ferred on the celebrated general count Maurice of Saxe, who died here in the year 1750, when the king gave it his heir the count de Frise, who died here in the year 1755.

Montargis, the capital of the Gatinois Orleanois, is situated on the river Loing, near the place where the canal of Orleans falls into it, twenty-five leagues to the south of Paris. The town is not large; but having been burnt down, is handsomely rebuilt, and has a castle pleasantly situated on a hill, that commands the town and the neighbouring country. Here is a bailiwick, a forest, a provincial court, and a salt-office. Besides the parish-church, there are ten chapels founded by the inhabitants, with a college, and several convents.

S E C T. XXVIII.

Of the Government of Maine and Perche; the Situation and Extent of those Provinces; their Produce, Rivers, and principal Towns.

THE government we are now going to describe comprehends the province of Maine, the earldom of Laval, and the greatest part of the earldom of Perche.

The county of Maine is bounded on the north by Normandy, on the east by Perche, on the south by Touraine and Orleanois, and on the west by Anjou and Brittany, extending eighty-eight miles in length from east to west, and fifty in breadth from north to south.

It has mines of iron, quarries of marble, and, being very fruitful, abounds in corn, wine, flax, and cattle: their fowls are particularly admired, and are well known at Paris. Its principal rivers are the Mayenne, or Maine; the Huïfne, which rises in Perche, and runs into the Sarte; the Sarte, which also rises in Perche, and after receiving the Orne, the Huïfne, the Enferne, and the Little Loire in its passage, falls into the Mayenne.

This country was formerly an earldom, but has been united to the crown ever since the year 1584. It is governed by its own laws; but is subject to the parliament of Paris, and has a particular sub-governor.

The principal places in this government are the following:

Mans, in Latin Cenomanum, the capital of the province of Maine, is situated on a hill, at the foot of which runs the river Sarte, which here unites its water with the river Huïfne, thirteen leagues to the north-west of Tours, and thirty-two to the south-west of Paris. It is the see of a bishop, and has a salt-office, a provincial and forest-court, &c. Its bishop, who is suffragan to the archbishop of Tours, has a diocese of six hundred and ninety-six parishes, and a revenue of thirty-five thousand livres, out of which he pays two thousand two hundred and sixteen florins to the court of Rome. In this city, besides the cathedral and two collegiate churches, are four abbeys, thirteen parish-churches, eight convents, one college, and one seminary.

Laval, the capital of an earldom, is seated on the Maine, eight leagues to the westward of Mans, and is encompassed by a wall and other fortifications in the antique taste: it has also an ancient castle of the same kind; but incapable of making any great defence, since the improvement of the art of war. It has a salt-office, a country and forest court, &c. and contains two collegiate churches, two parish-churches, one priory, and eight convents. This town was taken by escalade in 1446, by the brave Talbot earl of Shrewsbury, general of the English.

Perche is bounded by Normandy on the north, by the Isle of France and Orleanois on the east, by the river Maine on the south, and by Normandy on the west; it not being above fifteen leagues in length, and twelve in breadth.

It is a hilly country, and the eminences produce only grafs for cattle; but the valleys and plains bear all kinds of grain and hemp; they also abound in apples, of which they make cyder, the usual drink of the country: they have indeed a few vineyards, but the wine is so poor, that cyder is generally preferred before it. They have here also some iron mines, and mineral waters.

This country enjoys its own laws; is subject to the parliament of Paris, and governed by a particular sub-governor. The whole country does not belong to this government, Perche Gouet being subject to that of Orleanois, and Timerais to that of the Isle of France. The principal places in this country are the following:

Mortagne, the capital of Perche, is situated eighty-five miles to the west of Paris, and is the seat of a salt-office, a viscounty, a district court, a forest court, &c. It has one collegiate and three parish-churches, four convents, with one hospital, and has some considerable manufactures of coarse linen.

Bellesme, a small town ten miles to the south of Mortagne, and ninety to the west-by-south of Paris, disputes the rank of capital with Mortagne, and is also the seat of a royal viscount, a forest court, and a salt-office. In a neighbouring wood is the mineral spring of Herse, the water of which is in many cases very salutary.

S E C T. XXIX.

Of the Government of Paris; with a particular Description of that City, and the neighbouring Places.

THE boundaries of this government are not easily determined, the French geographers themselves being not agreed about them. It, however, includes, besides the city, a part of the neighbouring country; and, besides the governor, here are two lieutenant-generals, one of which is appointed for the city, the other for the *prevoté* and *vicomté*, through its utmost extent. Within the boundaries of this jurisdiction are contained four others; these are the Louvre and the Tuilleries, as also those of the Bastille and the royal hospital of invalids, the four governors of which receive their orders immediately from the king.

Paris, in Latin Lutetia, Parisii, and Lutetia Parisiorum, the capital of France, is seated in a large plain on the river Seine, in the middle of the Isle of France, in the forty-eighth degree fifty minutes north latitude, and in the second degree twenty-five minutes east longitude, two hundred and twenty-five miles to the south-east of London, seventy miles to the south of Rouen, five hundred and fifty to the west of Vienna, seven hundred to the north-west of Rome, and six hundred and twenty-five to the north-east of Madrid.

This city is of a circular form, about six or seven miles in diameter, and, including the suburbs, is eighteen or twenty in circumference. Its streets have been computed to amount to nine hundred and twelve, in which are about twenty thousand houses, from four to seven stories high; besides churches, convents, chapels, colleges, communities, and ware-houses. "The number of its inhabitants, says Dr. Busching, cannot much exceed four hundred thousand; for from the year 1728 to 1736 the annual bills of mortality were at a medium seventeen thousand eight hundred; and it is calculated, upon very probable computations, that of twenty-five persons in this city, one dies yearly, whence the above number of deaths make the number of living inhabitants four hundred and forty-five thousand."

This great city contains forty-seven parish-churches, besides twenty others; three abbeys and twelve priories for men, seven abbeys and six priories for women; seventeen collegiate churches, thirteen of which have chapters; fifty convents and fraternities of ecclesiastics and laics, forty-three nunneries, and fourteen female communities; eleven seminaries, twenty-six hospitals, and forty chapels; an university, six academies, besides three others where young gentlemen are taught bodily exercises; five public libraries, four royal palaces, four castles, above a hundred hotels, some of which are stately structures; seventy-three market-places, sixty fountains, twelve bridges over the Seine, ten of which are of stone, and eleven gates.

Among the disadvantages of this city it must be observed, that Paris affords no good water fit for drinking, the inhabitants being obliged to use that of the Seine, which is fetid, and occasions dysenteries; or another sort of water that is still worse, it being productive of the gravel

gravel and stone. The streets are lighted at night six months in the year; but this is performed in a very inelegant manner, by hanging up lanterns in the middle of the streets upon cords, which are put across from one window to another.

The new regulations for keeping the streets clean, formed by M. Turgot, provost of the merchants, consist in a canal lined with free-stone, six feet broad, and about the same depth, which receives all the soil from those parts of the city through which it runs. This canal is kept clean by means of a large reservoir formed in a particular building erected for that purpose, which is supplied with water from all the springs in the neighbourhood. In it are six pumps worked by a machine kept going by four horses, and these discharge the water into a large reservoir likewise lined with free-stone, whence it runs under ground through two ranges of pipes of a considerable bore, discharging itself with great violence into the above canal, and thus carries off all the filth into the Seine.

Here are good regulations in case of fire, for the first president of the parliament, and the lieutenant of the police, the horse and foot patrol, and some companies of the French and Swiss foot guards, are obliged to repair to a fire with all the expedition the distance of the place will admit; but the actual extinguishing of it is committed to the care of the monks of the four Mendicant orders, who on such occasions are to expend, for the benefit of the public, part of the stock they have acquired by begging.

To give a more particular description of this city: it consists of three parts, namely, the Town, which lies on the north of the Seine, the City, which is environed by that river, and the University, which lies to the south of it, with twelve suburbs. In 1702 it was also subdivided into twenty quarters, or wards.

The city is in the centre, and is the most cleanly and wealthy; it consists of three islands formed by the Seine; these are the Isle Du Palais, the Isle of Notre Dame, and the Isle Louviers. The last is small, and contains only store-houses for wood; it fronts the arsenal, and has a communication with the quarter of St. Paul by means of a wooden bridge.

The Isle of Notre Dame, or Our Lady, is so called from the cathedral of that name; the streets of which are very straight: by means of a stone bridge it has a communication with the quarter of St. Paul, by another with that of Maubert, and it is also joined by a wooden bridge to the Isle Du Palais: it has also some fine hôtels, with the parish-church of St. Lewis.

The Isle Du Palais, or the Island of the Palace, properly consists of Old Paris, and is so called from the place in which the parliament meets, and which takes up a great part of it. The metropolitan church stands at one end of this island, where are also several little parish-churches, the hospital of Hotel Dieu, or the House of God, which extends to the other side of the river towards the south, and a vast number of small crooked streets or lanes, built with very high houses, most of which are inhabited by several families.

Besides the above wooden bridge, which joins this island to that of Notre Dame, it has a communication with other parts of the city by means of seven stone bridges. The principal of these is the Pont Neuf, or New Bridge, which is the finest bridge in Paris. It consists of twelve arches, and is seventy-two feet broad, reckoning the parapets. The middle or carriage-way is thirty feet broad, and on each side is a foot-way raised. Over the piles on each side are also semicircular lodgements, in which are a hundred and seventy-eight small shops belonging to the king's footmen, which only serve to obstruct a most beautiful prospect. In the center of the bridge is a fine equestrian statue of Henry IV. in brass, larger than the life, and standing on a marble pedestal, on the sides of which are basso-relievos, with inscriptions representing the victories and principal actions of that hero. At the four corners are tied four slaves, also of brass, who trample upon antique arms. This stately monument is inclosed within iron rails. Another ornament of the Pont Neuf is the Samaritaine, a building three stories high, in which is an engine that supplies some parts of the city with water. It is thus named from

there being in the front a groupe of figures representing the story of Christ and the Samaritan woman.

Another bridge, called the Pont au Change, has a statue of Lewis XIV. in brass; and both this and the bridge of Notre Dame, on which are also water-works, have each two rows of houses upon them; those of the first being four, and of the last two stories high.

In the above island stands the cathedral of Notre Dame, which is a large and Gothic structure, three hundred and ninety-six feet long, a hundred and forty broad, and a hundred and two in height: on the inside are four rows of pillars, thirty in a row, with forty-five chapels, built between the outermost rows and the wall. The pillars in the nave of the church are adorned with large and beautiful pictures; and the choir was splendidly repaired and beautified by Lewis XIV. It has a small spire in the middle, and at the west end two square towers three hundred and eighty steps high; these are flat at the top, with a balustrade of free stone, whence you have a noble prospect of the city and the neighbouring country. In one of these towers are two large bells, one of which weighs forty thousand, and the other thirty-one thousand pounds.

Near this structure stands the palace of the archbishop, in one of the halls of which is the library of the advocates, founded for the public use. There are also in the island a great number of parish-churches.

To the north of these islands stands that division called Le Ville, or the Town, which is daily beautified by rebuilding the old houses. On the east is the arsenal near the river, which consists of several courts, and has beautiful walks in the garden near the city wall; and towards the north-east is the Bastile, a kind of fortress consisting of eight large round towers, joined together by other strong buildings, and surrounded with ditches and bastions. It is a prison for state criminals, and here the king keeps a governor, a lieutenant, and an independent company of soldiers.

Among the most considerable palaces in Paris, that of the Louvre is esteemed the principal ornament of the city. It is commonly divided into the Old and New. The old part of this royal palace was begun to be built with stone by Francis I. in 1528, and was finished by Henry II. in 1548. Succeeding kings improved and enlarged it, till Lewis XIV. ordered it to be rebuilt on a new plan, which, if completed, would have rendered it a most magnificent structure. The plan of the whole building forms an equilateral quadrangle, containing a court in the center three hundred and seventy-six feet square. The principal of the four main wings was built by Lewis XIV. as also the greatest part of the two others, which form the sides, together with a new front to that part which lies next the Seine. The four inner fronts, according to the plan, were to have consisted of eight pavilions, and eight *corps de logis*. The whole building is three stories high in the new part; the first of the Corinthian order, the second of the Composite, and the third of the Attic.

In the hall of the hundred Swiss is a kind of gallery supported by four gigantic figures. In this hall great entertainments were given, and queen Catharine of Medicis caused plays and interludes to be exhibited there for the amusement of the court. Henry IV. built a gallery along the river side quite to the Tuilleries, which is reckoned the finest in Europe; and under it is the royal printing-house.

At some distance behind the Louvre stands the palace called the Tuilleries, built in 1564 by order of queen Catharine de Medicis, in a place where they formerly made tiles, in French *tuilles*, from which the palace takes its name; and this structure was also improved by Lewis XIV. It is one range of building, with a dome in the middle, and a pavilion at each end. Before it is a handsome large space divided into three courts; the whole adorned with columns, pilasters, and other ornaments. Behind this palace are pleasant gardens adorned with fine walks, planted with evergreens and other trees, with beautiful parterres, where may be seen all the year round every flower in season. It has also three beautiful fountains, and a large octagonal canal. Towards the river is a fine terrace planted with three rows of trees, above a hundred perches long and eighty-four broad,

broad, and from this terrace is a most beautiful prospect over the adjacent country. These gardens are public, and great numbers of well dressed people in summer evenings resort thither. All who wear a black bag and a sword are permitted to walk here, though all their other cloaths are not worth a crown.

On the bank of the river beyond the Tuilleries, is the place called *le Cours*, composed of four rows of elms, eighteen hundred paces in length, forming three avenues that are all together a hundred and twenty feet in breadth; that in the middle is the broadest, and has room for six coaches to pass a-breast. In the midst of the *Cours* is a large ring, encompassed with trees at the same distance from each other as in the other parts of the walks.

The palace of Luxemburg was built by queen Mary de Medicis, on the ruins of the old hôtel of Luxemburg, which name it has retained. It is one of the most perfect and regular pieces of architecture in all France. Here is a gallery of fine paintings done by the celebrated Rubens, who spent two years in that work. It consists of the history of the life of Mary de Medicis, represented allegorically in twenty-four large pictures, nine feet broad and ten feet high, placed in the piers between the windows. The other apartments are also richly furnished, and adorned with a fine collection of valuable paintings. The gardens of this palace are elegantly laid out, and ornamented with fountains. They are daily visited in summer-time by the nobility and others, like those of the Tuilleries; but more especially on Sundays, when several thousands of all ranks make their appearance there. It is here the custom for the gentlemen and ladies of the first quality, though richly dressed, to sit down to discourse on the grass.

The royal palace was built by cardinal Richelieu, who made a present of it to Lewis XIII. It consists of several sets of buildings separated by large courts, and is adorned with fine gardens. Several new apartments have been added to it since the cardinal's time, and here queen Anne of Austria, mother to Lewis XIV. resided during the minority of her son. In this structure are now held the courts of justice, the most eminent of which is the parliament.

The royal observatory is a very stately edifice, built in 1667 upon the highest ground in Paris, and as neither iron nor timber has been employed in its construction, except for the staircase, it has cost great sums. Several astronomers, maintained by the king, have apartments in that house. The French make their first meridian pass through this observatory, which is two degrees thirty minutes more east than London, according to Street's observations; or, according to those of Harris, two degrees twenty-five minutes fifty-one seconds.

The Gobelins at Paris is a house so called from one Gobelin, a celebrated dyer, who removing from Rheims to Paris in the reign of Francis I. bought that house. He had discovered the secret of dying the beautiful scarlet called from him the scarlet of the Gobelins. Lewis XIV. bought that and some of the neighbouring houses, where he established a manufactory of the finest tapestries, and also settled a great number of gold and silver-smiths, embroiderers, painters, carvers, and other artificers in every branch tending to splendor and magnificence. They are all under the direction of the superintendant of the buildings, arts, and manufactures of France. There have been above eight hundred workmen employed here at a time; and though their number be since considerably decreased, yet there are still to be seen many things of the most curious workmanship worthy the curiosity of a traveller.

With respect to the churches, the most remarkable, after that of Notre Dame, which has been already described, are the following:

The church and nunnery of Val de Grace was founded by queen Anne of Austria, upon the supposed miraculous birth of Lewis XIV. after she had been married twenty-two years without having any offspring. Her heart and that of Henrietta Maria of England, duchess of Orleans, lie entombed here. The altar and cupola are exceeding fine. The nuns of this convent must all be of noble extraction, and choose a lady abbess once in

three years. Madam la Valiere, one of Lewis the XIVth's mistresses, retired to this monastery soon after her leaving the court. To it is a handsome ascent by several stone steps, which lead into a portico in the front of the church.

In the church which lately belonged to the Jesuits, and which stands in St. Anthony's street, they have the heart of Lewis the thirteenth inclosed in a gold case, supported by two angels of silver. Here is also a fine altar with several brass statues, and the monuments of the princes of Condé. This church is a neat and elegant modern structure.

St. Eustace is a large and beautiful church.

The Theatines have a large church and cloister by the side of the river, some distance below the college of the Four Nations. Cardinal Mazarine left a legacy for building this convent.

Clermont college is a square and lofty building, which, till lately, belonged to the Jesuits, who taught here in several schools about two thousand boys, many of whom were gentlemen's sons: these boarded here, and had several halls to dine in. Many of the scholars wear coloured gowns, with large round velvet caps when they learn logic, and square caps when they read philosophy.

The university of Paris is said to be founded by Charlemagne in 791. In this university are upwards of thirty colleges, the most considerable of which are the Sorbonne, the college of Navarre, the college of the Four Nations, and the faculty or college of physic.

The college of Sorbonne was founded in 1250; but was very poor when cardinal Richelieu caused it to be rebuilt in 1629. The present building is a very magnificent structure, in which are apartments for thirty-six doctors, with a library and halls for public lectures and acts. To the three professors chairs the cardinal added three others of a royal foundation. This is thought to be the strictest college in Europe, the degree of doctor being only given to those who hold the Sorbonnic act, which is to answer all disputants from sun-rise to sun-set: on which account the title of doctor of the Sorbonne is of great repute. The doctors wear black gowns, and when exercises are performed have white fur hanging across the breast.

The college of Navarre was founded by Jane, consort of Philip the Fair, queen of Navarre, in 1305, for studying divinity; and in 1683 three other chairs were added. Besides the fellowships for students in divinity, queen Jane founded also twenty others for students in grammar; six other fellowships have been founded here, and in this college are kept the records of the university.

The college of the Four Nations is the finest in the university, and designed for the reception of the children of gentlemen, or eminent citizens of four different nations, namely, French, Italians, Spaniards, and Germans. There should be sixty fellows in this college, by virtue of its original foundation; but they have been reduced to half that number. It is also called the college of Mazarine, from the cardinal of that name, who left two millions of livres to it in his last will. The university adopted this college upon condition that neither divinity, law, nor physic, should be taught in it; nor any academy annexed to it in which students should be taught to ride, fence, and dance. Besides the ordinary professors, here is one for mathematics. The doctors of the Sorbonne appoint the principal, who has the title of great master, and is always one of their own body. The fellowships are at the king's disposal, who gives them to such as are presented to him by the secretary of state of Paris. This college has a stately front, in the form of a theatre, facing the Louvre, which is on the opposite side of the Seine.

The faculty of physic has a college built in 1477, in which are five professors, who are annually chosen. The morning professors read lectures on physiology, botany, and pharmacy; and the evening professors on pathology and surgery. In this college is an amphitheatre, in which are annually given complete courses of anatomy, surgery, pharmacy, and chemistry. Every Saturday six doctors meet there in order to examine such of the poor who are sick, and come to consult them; and the bachelors of

physic

physic are obliged to attend, in order to write the prescriptions of the physicians. The faculty is composed of all the doctors and licentiates who have taken their degrees in the university of Paris: they have a dean at their head, and a censor. These doctors and licentiates have the sole right of practising physic at Paris, no physician of any other university being suffered to practise here, unless he be physician to the king or the royal family. All the professors in the university have settled salaries, and in most of the colleges there are fellowships for the students.

The several academies deserve to be particularly mentioned. These are, I. The French academy, founded in 1633, by cardinal Richelieu, for the improvement of the French language, which consists of forty members, who meet on Mondays, Thursdays, and Saturdays, in a hall of the Old Louvre.

II. The royal academy of inscriptions and belles lettres, instituted for the advancement of polite literature. In this academy ancient monuments are explained, and the transactions of the kingdom perpetuated by medals, inscriptions, &c. It consists of four sorts of members: these are twelve honorary, and twenty pensioners, with twenty-six associates and twelve students. Their meeting-days are on Wednesdays and Saturdays.

III. The royal academy of sciences, instituted in 1666, has also its honorary members, pensioners, associates, and students.

IV. The royal academy of painting and sculpture was founded in 1648. The master-pieces of the painters and sculptors admitted into this academy are disposed in three halls, and marked with the names of the several artists. Here are also the pictures of a great number of celebrated painters, and among the statues several of Gyps taken from antiques.

V. The royal academy of architecture was founded in 1671, but was not authorized by letters patent before the year 1717. It is divided into two classes: the first is composed of ten architects, a professor, and a secretary; and the second of twelve other architects. The professor, whose post, as well as that of the secretary, is for life, is obliged to read public lectures every Monday and Thursday in the hall of the Louvre.

The most considerable of the hospitals in this city are, that for disabled soldiers, the Hôtel Dieu, Trinity hospital, and the General hospital. The Royal hospital for disabled soldiers may be considered as a large palace, it taking up above seventeen acres. Here are four large courts, all of the same form, surrounded with regular buildings four stories high. In the middle is a fifth court, larger than all the four taken together. It is encompassed with a double row of arches, one above the other, forming very narrow galleries. The chapel is very beautiful, and its altar adorned in the most splendid manner. This hospital is full of lame and superannuated officers and soldiers. The great order and strict discipline observed in it cannot be sufficiently admired. It has a governor, a lieutenant of the king, and a major.

The Hôtel Dieu, or the House of God, is the most ancient and largest hospital in Paris. As all poor sick people are admitted into it, there have been sometimes four thousand persons in it at once. They are attended with the greatest care by the nuns of the order of St. Augustine, who discharge the office of nurses. To the honour of this hospital, all manner of patients are admitted, without regard to their country, religion, or disease; and no security is required for their burial in case of death: nor are those who labour under any incurable disease ever discharged, and suffered to perish in the streets.

In the suburbs of St. Victor is the General hospital, which also goes by the name of La Salpêtrerie; saltpetre having been formerly made here. In it is a noble foundation for the female sex, near seven thousand of whom are here provided for, and live under the inspection of sixty sisters, subordinate to whom are eighty governesses, and a considerable number of maid-servants. Into this place are received foundlings, who take up one ward: girls and young women, who sew and knit: a great number of bad women, who are here compelled to spin woollen: some hundreds of female idiots, who live

in little houses built in the form of a street: many other poor women, some of whom are kept here gratis, and others pay a small matter: delinquents who are confined, but not put to work.

To this admirable foundation also belongs the castle of Bicêtre, which is seated on an eminence at a small distance from the above-mentioned houses, and is on all sides defended by a wall, which is of very considerable compass, containing within it many large buildings, and several open squares. In this castle are near four thousand persons of the other sex, particularly poor men, who are entertained here gratis, and some who pay for their reception into the house. Persons disordered in their senses, whose ward resembles a village, it being built in regular streets. Twenty-five men and as many women afflicted with the venereal disease. Common prisoners are kept here in a particular house, walled in, and every one in a cell by himself: but the most remarkable thing here is the large well, which is a modern work: it is of a circular form, and from top to bottom lined with freestone. To the surface of the water it is a hundred and twenty-eight feet in depth, and twenty more to the bottom. Round the well, at the water's edge, is a gallery to which a person may, on occasion, be let down. The water is drawn up by means of an engine worked by four horses, who are relieved every three hours; it is received all day long into huge buckets, each of which contains twelve hundred pounds weight of water, which is discharged out of these into a leaden basin, whence it runs into a reservoir, and is conveyed by means of pipes to all the parts of this vast building.

The hospital de la Pietie, in St. Victor's street, constitutes also a part of the General hospital, and is the place where the governors usually hold their meetings. These three last foundations, together with the Hôtel Dieu, have one common fund, amounting to full two millions of livres per annum. Its present governors are twelve substantial citizens appointed by the provost of the merchants, and by the echevins; but approved by the parliament, before whom they must be sworn. There are also seven honorary administrators, or governors: these are the archbishop of Paris, the first president of the parliament, chamber of accounts, and court of aids, the attorney-general, the lieutenant-general of the police, and the provost of the merchants.

Trinity hospital was founded about the year 1202 by two friars for the reception of poor travellers: but it is now used for the maintenance and education of poor children of both sexes born at Paris in lawful wedlock. They wear blue gowns, and here are an hundred beds for boys, and thirty-six for girls, who have different apartments, in each of which there is an infirmary. The youngest are taught to read and write; and when they are six or seven years old, are instructed in some trade within the hospital. In order to encourage mechanics to come and exercise their trades here, and teach the children, the parliament has declared, that such journeymen as have taught these children six years in this hospital, shall have the freedom of the city, without any expence; and that such children as should be arrived at the age of twenty-five, and should have taught others during six years, after they were out of their apprenticeship, should enjoy the same privilege. This wise establishment has procured the city a vast number of skilful artificers. This hospital is administered by five eminent persons chosen by the parliament, out of ten presented to them by the attorney-general.

Among the squares in Paris the most famous is that called La Place de Victoires, or the Square of Victories. In it is a noble statue of Lewis XIV. which is one of the best pieces of statuary in Europe: it is of massy brass thirty feet high, clad in his robes, with Victory behind him of the same magnitude and metal, putting a crown on his head, and poised with her foot on a globe. Under her is a three-headed Cerberus, to represent Lewis XIV. triumphing over the triple alliance, with these words under it, VIRO IMMORTALI, or the immortal man, alluding to his fame. The whole piece was cast all at once, and weighs above thirty thousand pounds. The pedestal is twenty-two feet high, and upon it are four slaves of brass, with basso relievos of the king's battles and conquests.

quests. Under the pedestal is a pavement of marble inclosed within handsome iron rails.

The triumphal arch at Paris is said to exceed every thing of the kind in Europe, whether ancient or modern; this is at least the opinion of the French. The structure is indeed noble, it consisting of two faces of an extraordinary height, with three portals, after the manner of the ancient and modern Romans. The orders of the columns are finely designed, and the captives and trophies with which this structure is adorned are executed in the most admirable manner. On this arch is placed the king's statue on horse-back. The whole was done from the design of the famous Perault.

The other gates of the city and triumphal arches are all pompous pieces of architecture: that of St. Denis, leading to the square of the same name, is above seventy feet high, and as many over, adorned with columns, bas-reliefs, and trophies, with some inscriptions relating to the passage of the French over the Rhine, and their taking of Maestricht. The gate of St. Martin is fifty feet high and as many wide, and has on each side an inscription relating to the actions of Lewis XIV. The third gate is that of St. Anthony, erected in the reign of Henry II. but repaired and embellished by the city, with some inscriptions in honour of Lewis XIV.

Among the things worthy of observation at Paris is the fair of St. Germain, which begins on the third of February, and holds all Lent. The place where it is kept is a large square building, which has six or seven rows of shops, wherein the customers play at dice when they come to buy goods; for they are first cheapened and bought, and then the people play who shall pay for them. The greatest gaming is after candle-light, and sometimes the king himself comes hither to play. Here is a celebrated picture of our Saviour's ascension, with St. Peter, St. Paul, and two angels in the same piece, the work of Antonio Moro: the frame, which is curiously carved and richly gilt, is valued at two hundred pistoles.

On the river Seine are a great number of pleasure-boats belonging to the king and persons of quality, in which they sometimes take the amusement of sailing on the water, for the sake of the air. The water of this river generally looks green and dirty, which is not to be wondered at, as it is commonly filled with covered barges full of washer-women cleaning their linen: yet it is carried in pails through many of the streets, and sold as milk is in London. It is a common observation, that the French women are the worst laundresses in Europe: they wash their linen in cold water in the river, and as to ironing and plaiting, they have not the least notion of it. There are here indeed some English women, who will finish them pretty neatly, but not so white as in England, which may in a good measure be owing to the water.

At Paris are several courts whose jurisdiction extends very far. The principal of these are the parliament, which is the last resort in all causes where the crown does not interpose; a general court of the justices in eyre, a court of the constables and marshals of France; a court of the admiralty; the bailiwick of the palace; the court of the chatelet, or the ordinary court of justice for the civil government of the city, of which the provost, or mayor, with the four echevins, or aldermen, and twenty-six counsellors, are judges; an election, a salt office; a court of the warren of the Louvre, established for the preservation of the game six leagues round Paris, and to prevent people from hunting in those limits without leave; the court of the Hôtel de Ville, or town-house, which takes an account of the city rents, and of the taxes on all provisions brought into Paris; and the court of the consuls, which takes cognizance of every thing relating to commerce.

The French condemn malefactors to the gallies, to the gibbet, and to what is called being broke alive upon the wheel: the last is used only in case of murder; but if the evidence leaves only some room to doubt the guilt of the person accused, he is, as in many other countries, cruelly put to the torture to obtain a confession: and here it must be observed, that malefactors in France receive their sentence on their knees; which is no sooner pronounced than the hangman ties a rope about their necks, and

conveys them to prison, whence, after confession, they are generally dragged immediately to the gallows. The common place of execution is the Greve, the square in which stands the town-house; and we shall now give the manner wretches are broke, as it is called, on the wheel, which we shall take from Mr. Stephens's Travels through France. "In the middle of the square, says he, a scaffold was erected; and at half an hour after four the prisoner was brought to it in a cart, attended by the city guard, walking two and two, a priest accompanying the dying man. On the scaffold was erected a large cross, exactly in the form of that commonly represented for St. Andrew's. The executioner and his assistants placed the prisoner on it, in such a manner, that his arms and legs were extended agreeably to the form of the cross, and strongly tied down. Under each arm, leg, &c. was cut a notch in the wood, as a mark where the executioner might with the greater facility break the bone. He held in his hand an iron bar, not unlike an iron crow, and in the first place broke his arms, then in a moment after both his thighs. It was dreadful to see the poor wretch writhe his body with agony, and to observe the distortions of his face. It was a considerable time before he expired, and it would have been longer, had not the executioner given him what is called the *coup de grace*, or merciful stroke, on his stomach, which at once put an end to his misery. They then took the dead body from the cross, and put it on a wheel, fixed to a long pole, where he was exposed for some time; and this part of the ceremony occasions the common expression of being broke upon the wheel, though it is performed on a cross."

The trade of Paris with the other parts of the kingdom is very extensive. Their commerce with foreigners is also considerable; for it is observed, that one single branch, that of the gold, silver, and silk stuffs manufactured at Paris, is equal to the whole trade carried on at Lyons. They have here likewise manufactories of all other sorts of stuffs, of looking-glasses, and almost every necessary for the support and convenience of life.

There are in this city six principal companies of tradesmen, out of which the consuls, who have the regulation of trade, are chosen; these are the drapers, the grocers and apothecaries, the mercers and jewellers, the skinners, the hatters and goldsmiths: besides which there are the booksellers, the vintners and wine-merchants, the wool-merchants and timber-merchants: but though these are esteemed inferior to the others, they have the same privileges, and are capable of being elected consuls.

The land in the neighbourhood of this capital is in general flat and even, intermixed, however, with a few eminences. Towards the north of Paris the soil is fat, and produces a great quantity of very good corn. On the other side it is sandy, marshy, and wet. The whole is, however, cultivated with great care and industry; and the people have carried the art of gardening to such perfection, that in the midst of winter they raise all those sorts of kitchen stuff that seem to be the produce of summer only. Within the election of Paris they make one year with another about sixteen thousand hogsheds of wine, which is all drank at Paris, or in its neighbourhood.

This city has undergone the fate of most others; it has been several times besieged, twice burnt, and once considerably damaged by an inundation of the Seine. Henry VI. king of England, was crowned here, and his court was kept with great state and magnificence at the Louvre in 1422. On the twenty-first of August, 1572, it was in a most detestable manner stained with the blood of six thousand protestants; the signal for this most horrible massacre being given by the tolling of the great bell, which is still to be seen in the tower of the palace where the parliament sits. In the civil war Paris took part with the leaguers, and was besieged in the years 1589 and 1590 in vain by king Henry III. and IV. but in 1594 readily opened its gates to the latter, after his coronation.

In the neighbourhood of Paris are several palaces and little towns included under the same government, the principal of which are the following:

The wood of Vincennes reaches almost to the gates of Paris, and is inclosed round with a wall. Within this wood, at the distance of three miles to the east of Paris, is a royal palace, or castle, which was considerably improved and beautified by Francis I. Henry II. Lewis XIII. and XIV. It is an oblong square building, encompassed with dry ditches, which are lined and pretty deep. The castle is composed of several square towers, the highest of which is called the Donjon, and is surrounded with a particular ditch, over which there is a draw-bridge. The chapel, though in the Gothic taste, is not without beauty, it being adorned with several pyramids and other ornaments; and the pictures on the windows are highly valued. The rooms within the palace are beautiful and stately, and the cieling adorned with paintings.

The gate through which you enter the park is a fine piece of architecture, in the form of a triumphal arch, adorned with columns and statues, and stands in the middle of a large court, on each side of which is a fine suite of buildings, and an open gallery supported by rustic arches.

At the entrance of the park is a place where they used formerly to keep wild beasts, as lions, tygers, and leopards. This park takes up fourteen hundred and sixty-seven acres. The avenue leading to the palace has four rows of elms planted on a spot which has been made level for that purpose, they having been obliged to support it in several places by means of high and thick walls. This palace, or castle, has sometimes served as a prison for persons of the highest rank, and princes of the blood, when they have incurred the sovereign's displeasure.

About three miles to the west of Paris is the royal palace of Madrid, in the wood of Boulogne. This palace was built by Francis I. in 1529, after the model of the palace of Madrid in Spain. It consists of a suite of buildings three stories high, besides the ground-floor, and round it is a gallery reaching to the top of the first floor, supported by coupled columns. The arches have an ornament of a singular kind, they being incrustated with a sort of tiles that glisten very much when the sun shines upon them. The principal building is flanked on each side by two large pavilions, at the angles of which there are smaller ones. In the middle of the fronts of each of the large pavilions is a round tower, the top of which is in the form of a dome. The whole is surrounded with a narrow ditch.

Ruel is a small town on the Seine, five miles from Paris, where is a very handsome church, and some elegant gentlemen's houses; but it is principally noted for a seat built by cardinal Richelieu, which, though not magnificent, is admired for its neatness, and its being adorned with very beautiful gardens in the Italian taste, and curious water-works.

St. Maur de Fosse, on the river Marne, over which is a stone bridge, is about two leagues to the east of Paris. Here is an ancient abbey of St. Maur, which was secularized in 1535, and afterwards changed into a collegiate church of canons. Here is also a very fine seat, with beautiful gardens, belonging to the duke of Bourbon.

Conflans is a fine seat thus called, from its being near the confluence of the Seine and the Marne. It owes its beauty both to nature and the elegant taste of Francis de Harlay, archbishop of Paris: it belongs to that metropolitan's see, and is the country seat of the archbishops. The rooms within are extremely magnificent, especially the gallery, which is adorned with pictures done by the best masters. The gardens are very beautifully laid out, and adorned with statues, walks, water-works, groves, and other proper embellishments.

S E C T. XXX.

Of the Government of the Isle of France; its Situation, Extent, and Produce; with a particular Description of the Palaces of Versailles, Trianon, Marly, Fontainebleau, Meudon, St. Cloud, and the principal Cities.

THE government round the Isle of France is bounded on the north by Picardy, on the west by Normandy, on the south by the Orleanois, and on the east

by that of Champagne, extending about ninety miles in length, and as much in breadth.

The air is temperate, and the soil fertile; it therefore abounds in corn, wine, and fruit, and is divided into several small districts.

In describing the places in this government we shall begin with the palaces, these having a nearer relation to the subject of the last section.

The palace of Versailles, which lies four leagues to the south-west of Paris, stands on a rising ground in the midst of a country fit for hunting, and abounding with game. Lewis XIII. built a castle here, to serve as a hunting-seat; but Lewis XIV. being much pleased with the situation, converted the village into a fine town, and the castle into the most noble palace in the world. The side fronting the stables is not answerable in magnificence to the rest; but that facing the gardens is extremely beautiful. Its roof glittering with gold, affords a noble prospect at a distance, and the gardens, statues, canals, groves, grottos, fountains, and other water-works, far surpass any thing of the kind to be seen in Italy; and its riches and beauty within are altogether answerable to its outside.

The avenue leading to the castle divides the town into two parts; that which stands on the left hand, in coming from Paris, is called Old Versailles, and that on the right the New Town. The palace, which is seated on an eminence in the midst of a valley, is encompassed with hills. On the side towards Paris is a fine avenue of elms, the vista in the middle being sixty feet wide, and those on the sides thirty each. The end of the great royal square is encompassed with regular pavilions built by the princes and lords of the court; these, with other fine houses, form the new town. This square has a fountain in the middle of it, with walks like those leading to it.

From thence you ascend the great court of the palace, which is 480 feet long, with four large pavilions at the corners for officers lodgings. The great court is inclosed with an iron balustrade, and two large buildings, that form the wings on each side, having balconies supported by columns and adorned with fine statues. These wings, together with the pavilions, serve for offices to the palace, and have courts with other buildings behind them. There are other double apartments, which, joining those wings, form a communication between the new and old castle, and contracting the upper part of the great court end gracefully at the small one.

Out of this court is an ascent of three marble steps into a large landing place, and from thence by five more, into the little court paved with black and white marble. In the middle is a marble fountain and basin, with statues of gilt copper. The front and wings are of brick and free-stone, adorned with marble busts and brackets. Before this front is a balcony supported by eight marble columns of the Doric order, with red and white spots like jasper, and their bases and capitals of white marble. In the two angles of the wings in the front are hanging pedestals, which support two closets encompassed with gilt iron cases; and underneath are two basins of white marble in the form of shells, where young Tritons spout water. The middle building has three gilt iron doors in the porch, with apartments on the right and left.

In coming out of the great court, and passing through an open porch, you ascend by a large stair-case eighty-one feet long, and thirty broad. From this porch there is an entrance into two painted halls. The cieling of one of them is supported by eight marble columns of the Doric order, that have red and white veins; the capitals and bases are of a greenish colour, and the columns, being four on a side, divide the hall into three parts. On the sides opposite to each column are pilasters of the same marble, that support a cornice under the platform, and fronting the windows are niches with statues.

Next to this is another hall supported by twelve columns of the Ionic order, with marble pilasters behind them, that have red, black, violet, and yellow veins; and their capitals and bases are of fine white marble. From this you enter another hall of the same dimensions, whose cieling is an octagon, with twelve double pedestals by the windows and doors, of fine marble, on which

are

are placed figures of the twelve months, represented by winged young men in gilt copper. The pieces over the doors and windows are of a white or flame-coloured marble. Upon one side of this hall is the chamber and closet of the baths. All the parts that are not hung with tapestry are lined with marble, and the nearer you come to the king's apartments, the more sumptuous are the marbles, sculptures, and paintings.

The like order is observed in the upper apartments, which are eight on a floor, adorned with different sorts of marble and curious paintings. The guard hall is ornamented with marble that has black and yellow veins. In the other apartments is a marble with green veins, and others are lined with a fine marble called agate, brought from the Alps. On the side towards the green-house are other lodgings in the same order, with an apartment for the dauphine, under that of the queen, the cieling of which is curiously adorned. The queen's apartments are a suite of rooms that have the same dimensions with the king's; but of different workmanship; the paintings on the cielings represent the actions of the ancient heroes.

Opposite to the front of the palace is a large plat in the garden, one hundred yards long, and twelve broad: the principal front looks towards a piece of water, and has three balconies, supported by four columns each, and a figure upon every column representing a month of the year, and these balconies are richly adorned with statues.

It would take up a volume to describe the vast variety of paintings and statues with which the apartments of this palace are adorned. The royal cabinet for medals, coins, paintings, and the like curiosities, had the choice of all that Italy could afford. The king's lodgings are enriched with utensils of massy plate, even to the bedsteads, balustrades, and rails. The gallery towards the side of the garden is perhaps the noblest ever beheld, for its delightful prospect; with the fine statues and looking glasses placed between the pannels of the windows. The chapel, built in 1699, is a most finished piece of architecture, sculpture, and painting, performed by the most eminent masters.

Every room has a particular name taken from the principal object painted on the cieling; for instance, the hall of Plenty, from Plenty and Liberality being painted on the cieling. Here are several pictures of the Holy Virgin; one on a column of jasper, holding the infant Jesus, and surrounded with several pilgrims, done by Poussin; the Virgin Mary and St. Joseph flying into Egypt, by Guido, &c. The saloon of Venus has that goddess painted on the cieling, seated in a chariot drawn by doves, the gods and heroes adorning her triumph. Here are pictures of Nebuchadnezzar, who gives orders in relation to the gardens of Babylon; of Augustus exhibiting a chariot race in the circus; of Cyrus reviewing his army; and of Alexander marrying Roxana.

The hall of war has the cieling adorned with five pictures, the largest of which, in the middle, represents France holding a thunder-bolt in one hand, and a buckler in the other; the four others are on the sides of it: the first is Bellona in a violent rage; the second represents Germany in vain endeavouring to defend the Imperial crown; in the third Spain seems to threaten France; but her soldiers are put to flight: the fourth shews Holland thrown back upon her lion. This room is also adorned with six heads of the Roman emperors in porphyry; the drapery of the busts is of gilt brass, and they are placed on pedestals of oriental alabaster.

The king's bed-chamber is more magnificent than any of the rest; the carvings are all gilt, on a white ground. The bed is placed in an alcove, where two figures of Fame, who are represented sitting, seem to watch for the preservation of the king. The furniture of the bed is of crimson velvet, embroidered with gold, and the chamber is adorned with several fine pictures.

The gardens are no less magnificent than the palace. In descending from the terrace you see two basons which contain several water-spouts, and in the midst of each, a collection of spouts in the form of a wheat-sheaf, that rises twenty-nine feet high. The borders of these basons are each adorned with eight groups of brazen figures,

representing river gods and nymphs; and four others of the same metal representing Cupids, little nymphs, and genii. In two angles of that parterre are two other basons of marble, where the water is thrown into two sheets, that have a fine effect, and on the borders of the basons are groups of animals in brass. From this parterre you see in a kind of crescent which is below it, the bason of Latona, round which are represented a groupe of three figures, Latona, Apollo, and Diana. Latona here seems to complain to Jupiter of the cruelty of the peasants of Lycia, who are represented as metamorphosed into frogs, which throw a vast quantity of water upon the groupe.

There are several other basons with jets, and other curious water-works, a particular description of which would carry us too far; we shall therefore only mention the famous canal, at one end of which is a bason of an octagonal figure, four hundred and twenty feet in diameter; four of its sides are circular, three in straight lines, and the other joins the canal. In two of the angles of this bason is a sea-horse with a Triton on his back. The great canal is thirty-two fathoms broad, and eight hundred long, including the basons at each end. In the middle it is crossed by another canal about five hundred and twenty fathoms in length. Upon these canals the court sometimes divert themselves in yachts and galleys.
